Restricted Permission: This publication is protected by copyright law and international treaties and contains trade secrets and proprietary information owned by Cadence. Unauthorized reproduction or distribution of this publication, or any portion of it, may result in civil and criminal penalties. Except as specified in this permission statement, this publication may not be copied, reproduced, modified, published, uploaded, posted, transmitted, or distributed in any way, without prior written permission from Cadence. Unless otherwise agreed to by Cadence in writing, this statement grants Cadence customers permission to print one (1) hard copy of this publication subject to the following conditions:

1. The publication may be used only in accordance with a written agreement between Cadence and its customer.
2. The publication may not be modified in any way.
3. Any authorized copy of the publication or portion thereof must include all original copyright, trademark, and other proprietary notices and this permission statement.
4. The information contained in this document cannot be used in the development of like products or software, whether for internal or external use, and shall not be used for the benefit of any other party, whether or not for consideration.

Disclaimer: Information in this publication is subject to change without notice and does not represent a commitment on the part of Cadence. Except as may be explicitly set forth in such agreement, Cadence does not make, and expressly disclaims, any representations or warranties as to the completeness, accuracy or usefulness of the information contained in this document. Cadence does not warrant that use of such information will not infringe any third party rights, nor does Cadence assume any liability for damages or costs of any kind that may result from use of such information. Cadence is committed to using respectful language in our code and communications. We are also active in the removal and replacement of inappropriate language from existing content. This product documentation may however contain material that is no longer considered appropriate but still reflects long-standing industry terminology. Such content will be addressed at a time when the related software can be updated without end-user impact.

Restricted Rights: Use, duplication, or disclosure by the Government is subject to restrictions as set forth in FAR52.227-14 and DFAR252.227-7013 et seq. or its successor.

About This Manual

The Cadence® Innovus™ Implementation System family of products provides an integrated solution for an RTL-to-GDSII design flow. This manual describes the syntax for the Innovus™ Implementation System (Innovus) text commands.

The chapters are presented alphabetically by general command functionality. Within each chapter, the text commands appear alphabetically.

Audience

This manual is written for experienced designers of digital integrated circuits. Such designers must be familiar with design planning, placement and routing, block implementation, chip assembly, and design verification. Designers must also have a solid understanding of UNIX and Tcl/Tk programming.

Conventions Used in This Manual

This section describes the typographic and syntax conventions used in this manual.

`text`	Indicates text that you must type exactly as shown. For example: `set_message -severity info`
`text`	Indicates information for which you must substitute a name or value. In the following example, you must substitute the name of a specific file for *`depth_of_hierarchy`*: `report_area -depth` *`depth_of_hierarchy`*
text	Indicates the following: • Text found in the graphical user interface (GUI), including form names, button labels, and field names • Terms that are new to the manual, are the subject of discussion, or need special emphasis • Titles of manuals

`[ ]`	Indicates optional arguments. In the following example, you can specify none, one, or both of the bracketed arguments: `command [-arg1] [arg2 value]`
`[ | ]`	Indicates an optional choice from a mutually exclusive list. In the following example, you can specify any of the arguments or none of the arguments, but you cannot specify more than one: `command [arg1 | arg2 | arg3 | arg4]`
`{ | }`	Indicates a required choice from a mutually exclusive list. In the following example, you must specify one, and only one, of the arguments: `command {arg1 | arg2 | arg3}`
`{[ ] [ ]}`	Indicates a required choice of one or more items in a list. In the following example, you must choose one argument from the list, but you can choose more than one: `command {[arg1] [arg2] [arg3]}`
`{ }`	Indicates curly braces that must be entered with the command syntax. In the following example, you must type the curly braces: `command arg1 {x y}`
. . .	Indicates that you can repeat the previous argument.
. . .	Indicates an omission in an example of computer output or input.
Command - Subcommand	Indicates a command sequence, which shows the order in which you choose commands and subcommands from the GUI menu. In the following example, you choose *Power* from the menu, then *Power Planning* from the submenu, and then *Add Ring* from the displayed list: *Power - Power Planning - Add Ring* This sequence opens the *Add Rings* form.

Related Documents

For more information about the Innovus family of products, see the following documents. You can access these and other Cadence documents with the Doc Assistant documentation system.

Innovus Product Documentation

- What's New in Innovus
  Provides information about new and changed features in this release of the Innovus family of products.
- Innovus User Guide
  Describes how to install and configure the Innovus software, and provides strategies for implementing digital integrated circuits.

- get_power
- get_property
- index_collection
- list_property
- query_objects

- range_collection
- remove_from_collection
- report_property
- sizeof_collection
- sort_collection

Overview

The following lists the Advanced Timing Tcl Scripting commands. For each category of similar commands, we explain what they are used for followed by some simple examples.

all_* Commands

The `all_*` commands return a collection of all the items of a specific type. Several of the commands provide options to filter the collection based on certain properties:

- `all_clocks`
- `all_connected`
- `all_fanin`
- `all_fanout`
- `all_inputs`
- `all_instances`
- `all_outputs`
- `all_registers`

Examples

- To set all the clocks to propagated mode, use the following command:
  ```
  set_propagated_clock [all_clocks]
  ```
- To report the worst timing path that begins at a register and ends at an output port, use the following command:
  ```
  report_timing -from [all_registers] -to [all_outputs]
  ```
- To store a collection of pins that fanout from a specific port, use the following command:
  ```
  set clk1Fanout [all_fanout -from clk1 -pin_levels 1]
  ```

get_* Commands

The `get_*` commands return a collection of items filtered by name pattern or object type. Additionally, you can use the `-filter` option for most of the `get_*` commands to filter the collection by property value. See the get_property command for a list of all the properties.

The `filter_expression` for the `-filter` option can be created by combining several object properties using the following relational and logical operators: `>`, `<`, `==`, `!=`, `<=`, `>=`, `&&`, `||`, `=~`, `!~`, `AND`, and `OR`. You also can use parentheses to create expressions. The `get_*` commands include the following:

- `get_arcs`
- `get_cells`
- `get_clocks`
- `get_designs`
- `get_generated_clocks`
- `get_lib_arcs`
- `get_lib_cells`
- `get_lib_pins`
- `get_libs`

- `get_nets`
- `get_object_name`
- `get_path_groups`
- `get_pins`
- `get_ports`

Examples

- To return a collection of all input ports (same as running `[all_inputs]`), use the following command:
  ```
  get_ports -filter "direction==in"
  ```
- To return a collection of pins that match `*/D`, use the following command:
  ```
  get_pins -hier -filter "hierarchical_name =~ */D"
  ```
- To return a collection of the libraries a cell belongs to, use the following command:
  ```
  get_lib_cells INVXL
  ```

property Commands

The list_property command lists the properties for the different object types. This command, without arguments, will list all the properties for all object types. Use the `-type` option to list properties for a specific object type. Legal option types are: `cell`, `clock`, `design`, `lib`, `lib_cell`, `lib_pin`, `lib_timing_arc`, `net`, `path_group`, `pin`, `port`, `timing_arc`, `timing_path`, or `timing_point`. For example:

```
list_property -type lib_timing_arc
```

The above command generates the following output:

```
object_type : lib_timing_arc
================================================
property                  | return_type
------------------------------------------------
from_lib_pin              | collection
has_ccs_noise             | boolean
has_socv                  | boolean
is_disabled               | boolean
mode                      | string
object_type               | string
output_signal_level_high  | float
output_signal_level_low   | float
sdf_cond                  | string
sense                     | string
timing_type               | string
to_lib_pin                | collection
when                      | string
when_end                  | string
when_start                | string
```

Examples

- The get_property command returns the value of the specified property. To report the clock period of clk1, use the following command:
  ```
  get_property [get_clocks clk1] period
  ```
- The report_property command returns the properties and their values for a specified object. To report the properties for clock clk1, use the following command:
  ```
  report_property [get_clocks clk1]
  ```
- For timing related properties such as properties for timing arcs, paths, and points run `report_timing -collection`. This will return the results in a collection of timing paths.
  - To report timing and store the top 10 paths as a collection in the variable `$paths`, use the following command:
    ```
    set paths [report_timing -collection -max_paths 10]
    ```
  - To filter `$paths` to include only those paths with slack between -0.806ns and 0ns, use the following command:
    ```
    set newPaths [filter_collection $paths {(slack > -0.806 && slack < 0.0)}]
    ```

collection Commands

Once you have the collection defined you can manipulate, filter, cycle through, and query it using the collection related commands:

- `add_to_collection`
- `append_to_collection`
- `compare_collections`
- `copy_collection`
- `filter_collection`
- `foreach_in_collection`
- `index_collection`
- `query_objects`
- `remove_from_collection`
- `sizeof_collection`
- `sort_collection`

Examples

- To list the contents of a collection, use the following command:
  ```
  query_objects $collectionName
  ```
- To cycle through the items of a collection, use the following command:
  ```
  foreach_in_collection iCell [get_cells *] {
  Puts "Cell = [get_property $iCell hierarchical_name]"
  }
  ```

add_to_collection

```
add_to_collection
[-help]
base_collection
second_collection_or_list
[-unique]
```

Creates a new collection by adding objects from one collection to another collection. The following rules apply:

- If all of the objects in the base collection are of the same type, only the objects in the second collection that are the same type as those in the base collection are added to the new collection. If you specify an object list instead, all of the objects in the list must be the same type as those in the base collection.
- If the base collection contains different types of objects, all objects in the second collection are added. In this situation, you cannot specify an object list.

If the software finds no objects to add, an empty collection is returned.

Parameters

`-help`	Prints out the command usage.
`base_collection`	Specifies the base collection of objects. Objects from the second collection or object list are added to this collection to create the new collection.
`second_collection_or_list`	Specifies the second object collection, or a list of objects.
`-unique`	Removes any duplicate objects from the new collection.

Examples

- The following command returns a collection which contains both the output ports as well as the input ports:
  ```
  add_to_collection [all_outputs] [all_inputs]
  ```

  Output:
  ```
  CLK4 CLK3 CLK2 CLK1 IN4 IN3 IN2 IN1 OUT4 OUT3 OUT2 OUT1 OUT5
  ```

  Here, the input and output ports are as follows:
  ```
  all_inputs
  CLK4 CLK3 CLK2 CLK1 IN4 IN3 IN2 IN1

  all_outputs
  OUT4 OUT3 OUT2 OUT1 OUT5
  ```

Related Information

- compare_collections
- copy_collection
- filter_collection

all_clocks

```
all_clocks
[-help]
```

Creates a collection of all the clocks in the current design. If no clocks were defined, an empty string `""` is returned.

To filter clocks, use the `get_clocks` command to create a collection of clocks matching a specific pattern. Assign these clocks to a variable or pass them using another command.

Parameters

None

Example

- The following example applies the `set_propagated_clock` command to all the clocks in the design:
  ```
  set_propagated_clock [all_clocks]
  ```

Related Information

- `create_clock`
- `get_clocks`
- `set_propagated_clock`
- `all_inputs`

all_connected

```
all_connected
[-help]
[-leaf]
single_object_collection_or_object
```

Returns a collection of all of the objects connected to the specified net, pin, or port.

Parameters

`-help`	Prints out the command usage.
`-leaf`	Returns only the flattened connection points (leaf pins) for the specified net. *Default:* Returns all hierarchical ports connected to the specified net
`single_object_collection_or_object`	Specifies the net, pin, or port for which to return the collection of connected objects. You can specify an object name, or a single-object collection.

Examples

- The following command returns a collection of all of the objects connected to the pin `b1_Sin1`:
  ```
  all_connected Sin1
  ```
  The software returns the following information:
  ```
  Sin1
  ```
- The following command returns a collection of all of the objects connected to a pin contained in the single collection object i_block1/b1_Sin1:
  ```
  all_connected [get_pins {i_block1/b1_Sin1}]
  ```
  The software returns the following information:
  ```
  Sin1
  ```
- The following command returns a collection of all of the hierarchical ports connected to the net `net_1`:
  all_connected [get_nets net_1]

  The software returns the following information:

  TL2/I2_in TL1/I1_out
- The following command returns a collection that contains only the flattened connection points for the net `net_1`:
  ```
  all_connected -leaf [get_nets net_1]
  ```
  The software returns the following information:
  ```
  TL2/L1/RX/D TL1/RX/Q
  ```

all_fanin

```
all_fanin
[-help]
[-hpin]
[-only_cells]
[-startpoints_only]
-to {collection | object_list}
[-trace_through {case_disable | user_disable | all | clocks | loop_snipped}]
[-view view_name]
[-levels value | -pin_levels value]
[ > | >> ]
```

Returns a collection of pins, ports, or cells that exist in the fanin cone of the specified objects.

Parameters

`-help`	Prints out the command usage.
`> | >>`	Stores the generated collection in the specified file. You can add the `.gz` extension to the file name to generate a compressed report. **Note:** The file name must be the last parameter specified.
`-hpin`	Returns hierarchical pins along with the flat pins.
`-levels value`	Specifies the number of gate levels to go back from a specific pin object to create the collection.
`-only_cells`	Returns a collection only of the cells in the fanin zone.
`-pin_levels value`	Specifies the number delay arcs to go back from a specific pin object to create the collection.
`-startpoints_only`	Returns a collection only of valid start points in the fanin zone.
`-trace_through {case_disable |user_disable | all | clocks | loop_snipped}`	You can specify one of the following options: • `case_disable`: Allows traversal of arcs disabled using `set_case_analysis` command. Arcs disabled using `set_disable_timing` are not traversed. • `user_disable`: Allows traversal of arcs disabled using `set_disable_timing` command, but arcs disabled using `set_case_analysis` command are not traversed. • `all`: Allows traversal through all the arcs • `clocks`: Allows traversal through pins for which clock constraints (such as, `create_clock`, `create_generated_clock`) are applied. The pins that are disabled using the `set_case_analysis` and `set_disable_timing` commands are not traversed. • `loop_snipped`: Allows trace through the loop snipped arcs.
`-to {collection | object_list}`	Specifies the objects for which to return the collection. You can specify a list of objects, or a collection of objects.
`-view view_name`	Specifies the view name for which fan cone traversal is to be performed.

Examples

- The following command returns the collection of cells in the fanin zone of the output port OUT1:
  ```
  all_fanin -to OUT1 -only_cells
  ```
- The following command returns all the valid startpoints (sequential elements and/or input ports) in the fanin zone of OUT1, allowing the traversal through arcs disabled by `set_case_analysis` and `set_disable_timing`:
  ```
  all_fanin -to OUT1 -startpoints_only -trace_through all
  ```

Related Information

- `all_fanout`

all_fanout

```
all_fanout
[-help]
[-endpoints_only]
[-hpin]
[-only_cells]
[-trace_through {case_disable | user_disable | all | clocks | loop_snipped}]
[-view view_name]
[-levels value | -pin_levels value]
{-from {collection | object_list} }
[ > | >> ]
```

Returns a collection of pins, ports, or cells that exist in the fanout cone of the specified objects.

Parameters

`-help`	Prints out the command usage.
`-endpoints_only`	Returns a collection only of valid end points in the fanout zone.
`-hpin`	Returns hierarchical pins along with the flat pins.
`> | >>`	Stores the generated collection in the specified file. You can add the `.gz` extension to the file name to generate a compressed report. **Note:** The file name must be the last parameter specified.
`-from {collection | object_list}`	Specifies the objects for which to return the collection. You can specify a list of objects, or a collection of objects.
`-levels value`	Specifies the number of gate levels to go forward from a specific pin object to create the collection.
`-only_cells`	Returns a collection only of the cells in the fanout zone.
`-pin_levels value`	Specifies the number delay arcs to go forward from a specific pin object to create the collection.
`-trace_through {case_disable |user_disable | all | clocks | loop_snipped}`	Allows traversal through disabled arcs. You can specify one of the following options: • `case_disable`: Arcs which are disabled using the `set_case_analysis` command and through physical constant are traversed. The arcs disabled using `set_disable_timing` are not traversed. • `user_disable`: Arcs disabled using `set_disable_timing` command are traversed but those disabled using `set_case_analysis` command are not traversed. • `all`: Enables trace through all arcs • `clocks`: Allows traversal through pins for which clock constraints (such as, `create_clock`, `create_generated_clock`) are applied. The pins that are disabled using the `set_case_analysis` and `set_disable_timing` commands are not traversed. • `loop_snipped`: Allows trace through the loop snipped arcs.
`-view view_name`	Specifies the view name for which fan cone traversal is to be performed.

Examples

- The following command returns the collection of cells in the fanout zone of the input port IN1:
  ```
  all_fanout -from IN1 -only_cells
  ```
- The following command returns all the valid endpoints (sequential elements and/oroutput ports) in the fanout zone of IN1, allowing the traversal through arcs disabled by `set_case_analysis` and `set_disable_timing`:
  ```
  all_fanout -from IN1 -endpoints_only -trace_through all
  ```

Related Information

- `all_fanin`

all_inputs

```
all_inputs
[help]
[-clock list_of_clocks]
[-no_clocks]
[-edge_triggered]
[-level_sensitive]
```

Creates a collection of all the input ports in the current design. To filter inputs, use the `get_ports` command to create a collection of ports matching certain criteria. Assign these ports to a variable or pass them using another command. You can limit the contents of the collection to ports with input delay relative to a specific clock.

Parameters

`-help`	Prints out the command usage.
`-clock list_of_clocks`	Considers only input ports with input delay relative to the specified list of clocks.
`-edge_triggered`	Returns a collection of input ports with the `set_input_delay -clock` constraint.
`-level_sensitive`	Returns a collection of input ports with the `set_input_delay -level_sensitive` constraint.
`-no_clocks`	Returns primary input ports that do not have `create_clock` or `create_generated_clock` constraints.

Example

- The following command returns the names all of the input ports with input delay relative to an `ideal_clk`:

  ```
  all_inputs -clock ideal_clk
  ```

Related Information

- `get_ports`
- `report_ports`
- `set_input_delay`

all_instances

```
all_instances
[-help]
object
[-hierarchical]
```

Returns a collection of all instances available in a design, or all instances of a specified library cell existing in the current design.

You cannot use the `all_instances` command on the top level of the design (`all_instances [get_design top]`).

However, you can use the command for hierarchical modules inside the top level. For example, if `SUB` is a hierarchical module in the top level of the design, you can specify the following command to return all instances of that module: `all_instances [get_design SUB]`.

Parameters

`-help`	Prints out the command usage.
`-hierarchical`	Specifies that the patterns should be matched hierarchically. If the hierarchical name of an instance at a particular hierarchical level matches the patterns, it is included in the result.
object	Specifies the name of a design or a library cell in the current design. You can specify a pattern for the design or library cell name, or a single collection of a design or library cell.

Examples

- The following command returns a collection of all the instances of the library cell BUF:
  ```
  all_instances BUF
  ```

all_outputs

```
all_outputs
[-help]
[-clock list_of_clocks]
[-edge_triggered]
[-level_sensitive]
```

Creates a collection of all output ports in the current design. To filter outputs, use the `get_ports` command to create a collection of ports matching certain criteria. Assign these ports to a variable or pass them using another command. You can limit the contents of the collection to ports with output delay relative to a specific clock.

Parameters

`-help`	Prints the command usage.
`-clock list_of_clocks`	Considers only output ports with an output delay relative to a specific list of clocks.
`-edge_triggered`	Returns a collection of output ports with the `set_output_delay -clock` constraint.
`-level_sensitive`	Returns a collection of output ports with the `set_output_delay -level_sensitive` constraint.

Example

- The following command returns the names all of the output ports with an output delay relative to an ideal_clk:
  ```
  > all_outputs -clock ideal_clk
  ```

Related Information

- `get_ports`
- `report_ports`
- `set_output_delay`

all_registers

```
all_registers
[help]
[-clock {clock_list}]
[-cells]
[-rise_clock {clock_list}]
[-fall_clock {clock_list}]
[-flops | -edge_triggered]
[-no_hierarchy]
[-latches | -level_sensitive]
[-macros]
[-master_slave]
[-data_pins]
[-clock_pins]
[-output_pins]
[-async_pins]
[-slave_clock_pins]
```

Returns a collection of instances and pins of flip-flops, latches, or sequential macros in the design. A cell is considered sequential if the library cell defines trigger or timing check arcs.

Note: The following options can be used only after building the timing graph:

- `-clock`
- `-rise_clock`
- `-fall_clock`

Parameters

`-help`	Prints out the command usage.
`-async_pins`	Returns a collection of async preset or clear pins.
`-cells`	Creates a collection of cells. This is the default option.
`-clock` {*`clock_list`*}	Specifies the name of a clock or a list of clocks. The `all_registers` command creates a collection of registers clocked by the specified *`clock_list`*.
`-clock_pins`	Returns a collection of register clock pins. You can use other parameters to further filter this collection.
`-data_pins`	Returns a collection of register data input pins. You can use other parameters to further filter this collection.
`-fall_clock` {*`clock_list`*}	Specifies the name of a clock or a list of clocks. The `all_registers` command creates a collection of registers opened by the falling edge of the clocks specified in the *`clock_list`*.
`-flops | -edge_triggered`	Returns a collection of edge-triggered sequential instances. Both the `-flops` and `-edge_triggered` options return the same collection. The `-flops` option is provided for backward compatibility.
`-latches | -level_sensitive`	Returns a collection of level-sensitive sequential instances. Both `-latches` and `-level_sensitive` options return the same collection. The `-latches` option is provided for backward compatibility.
`-macros`	Returns sequential instances that are neither flip-flops nor latches.
`-master_slave`	Returns a collection of master-slave register cells.
`-no_hierarchy`	Searches the current instance only; does not descend the hierarchy.
`-output_pins`	Returns a collection of register output pins.
`-rise_clock` {*`clock_list`*}	Specifies the name of a clock or a list of clocks. The `all_registers` command creates a collection of registers opened by the rising edge of the clocks specified in the *`clock_list`*.
`-slave_clock_pins`	Returns a collection of slave clock pins of the master-slave registers. You can specify the slave clock pins as `clocked_on_also` in the library.

Example

- The following command reports the10 worst paths going to registers in the design:
  ```
  report_timing -to [all_registers] -max_paths 10
  ```
- the following script using the `all_registers` command along with other Innovus commands can be used to get number of flops in the design:
  ```
  set flopName [all_registers -flops]

  set flopCount [sizeof_collection $flopName]

  puts "Number of flops in the design is $flopCount"
  ```

Related Information

- get_cells
- get_pins

append_to_collection

```
append_to_collection
[help]
var_name
second_collection_or_list
[-unique]
```

Appends objects from one collection to another collection. The following rules apply:

- If all of the objects in the base collection are of the same type, only the objects in the second collection that are the same type as those in the base collection are appended to the base collection.
- If the base collection contains different types of objects, all objects in the second collection are appended to it. In this situation, you cannot specify an object list.

If the software finds no objects to add, an empty collection is returned.

Parameters

`-help`	Prints out the command usage.
var_name	Specifies a pointer to the base collection of objects. The objects in the second collection or object list are appended to this collection. If you specify a pointer that does not refer to an existing base collection, the software creates a new collection that uses the pointer as a reference.
second_collection_or_list	Specifies the second collection of objects, or an object list.
`-unique`	Retains any duplicate objects that already exist in the base collection, but does not append duplicate objects from the second collection to the base collection.

Examples

- The following command appends the nets in the specified collection to the collection `newVar`:

  ```
  append_to_collection newVar [get_nets {CLK1}]
  ```

- The following command appends the specified nets to the collection `newVar`:

  ```
  append_to_collection newVar {Sin1 CLK1 Sout1}
  ```

- You can use the following commands to create another collection:

  ```
  tempus 6> set base_clock [get_clocks sbw_clk]
  0xe50
  tempus 7> set top_clock [get_clocks aclk]
  0xe51
  tempus 8> set base_top_clock ""
  tempus 13> append_to_collection base_top_clock $base_clock
  0xe54
  tempus 14> append_to_collection base_top_clock $top_clock
  0xe54
  tempus 15> get_clocks $base_top_clock
  sbw_clk aclk
  0xe55
  tempus 16> get_clocks $base_clock
  sbw_clk
  0xe56
  tempus 17> get_clocks $top_clock
  aclk
  0xe57
  ```

  Note: If a new collection variable is defined with an existing collection, then both point to the same object set. Any modifications made into either collection will be visible in both cases - because they reference each other.

Related Information

- add_to_collection
- compare_collections
- copy_collection
- filter_collection
- foreach_in_collection

compare_collections

```
compare_collections
[-help]
collection1
collection2
[-order_dependent]
```

Compares two collections, and returns a value of `0` if all of the objects contained in both collections are the same. If the objects contained in both collections are different, the software returns a value of `1`.

Parameters

`-help`	Prints out the command usage.
collection1	Specifies the first collection.
collection2	Specifies the second collection.
`-order_dependent`	Specifies that the order of the objects in both collections must be the same for the collections to be considered the same.

Examples

- The following example shows 3 collections as defined below:

```
set coll1 [all_registers]
set coll2 [get_cells -hierarchical * -filter "is_sequential==true"]
set coll3 [get_cells -hierarchical * -filter "is_combinational==true"]
```

- The collection coll1 and coll2 are identical, while coll1 and coll3 are not, and this can be checked by the following commands:

```
compare_collections $coll1 $coll2
0
compare_collections $coll1 $coll3
1
```

Related Information

- add_to_collection
- copy_collection
- filter_collection
- foreach_in_collection

copy_collection

```
copy_collection
[-help]
base_collection
```

Returns a collection that is an exact copy of the specified base collection.

Parameters

`-help`	Prints out the command usage.
`base_collection`	Specifies the base collection of objects.

Related Information

- `add_to_collection`
- `compare_collections`
- `filter_collection`
- `foreach_in_collection`

define_property

```
define_property
[-help]
-object_type {object_type_list}
-type data_type
[-lower_bound val]
[-upper_bound val]
[-string_values {values}]
property_name
```

Defines a new property.

Design objects can be associated with user-defined commands that can be used for analysis and debugging purposes.

You can use the `define_property` command if a define statement is not used for the specified property value(s). To read property values from the library, the command must be issued before the timing library is read.

Parameters

`-help`	Prints out the command usage.
`-lower_bound` *val*	Specifies a lower range - integer, float, or double.
`-object_type` *object_type_list*	Specifies the type of object on which the property is to be defined.
property_name	Specifies the name of the property.
`-string_values` *values*	Specifies the values that can be defined for the property.
`-type` *data_type*	Specifies the type of property.
`-upper_bound` *val*	Specifies a higher range - integer, float, or double.

Examples

- The following example defines property having object type `pin` and type of property `int`:
  ```
  define_property -object_type pin -type int slk
  ```
- The following example defines a property on a library arc:
  ```
  define_property -object_type lib_arc -type int libArcProperty
  ```
- The following example defines `aocv_weight` property on a library arc:
  ```
  define_property -type float -object_type lib_arc aocv_weight
  ```
- The following example defines certain nets as critical, using the `critical_net` property and then setting it to `true` for those nets:
  ```
  define_property critical_net -object_type net -type boolean
  set_property [get_nets n2] critical_net true
  ```

  You can view the report and query on critical nets, as shown below:

  ```
  innovus> report_property [get_nets n2]

  ...

  property                          | value
  ---------------------------------------------------
  capacitance_max                   | 0.002
  capacitance_min                   | 0.002
  driver_pins                       | {...}
  escaped_name                      | n2
  hierarchical_name                 | n2
  has_detailed_parasitics           | false
  is_dont_touch                     | false
  is_hierarchical                   | false
  load_pins                         | {...}
  name                              | n2
  object_type                       | net
  pin_capacitance_max               | 0.002
  ```

```
pin_capacitance_max_rise           | 0.002
pin_capacitance_max_fall           | 0.002
pin_capacitance_min                | 0.002
pin_capacitance_min_rise           | 0.002
pin_capacitance_min_fall           | 0.002
total_capacitance_max_fall         | 0.002
total_capacitance_max_rise         | 0.002
total_capacitance_min_rise         | 0.002
total_capacitance_min_fall         | 0.002
wire_capacitance_max               | 0.000
wire_capacitance_min               | 0.000
wire_capacitance_max_rise          | 0.000
wire_capacitance_max_fall          | 0.000
wire_capacitance_min_rise          | 0.000
wire_capacitance_min_fall          | 0.000
critical_net                       | true
```

```
innovus> get_property [get_nets n2] critical_net
true
```

```
innovus> get_nets -filter "critical_net==true"
n2
0x1c
```

Related Commands

- report_property
- set_property
- reset_property

filter_collection

```
filter_collection
[-help]
base_collection
{filter_expression}
[-nocase]
[-quiet]
[-regexp]
```

Returns a collection of objects that were filtered from the specified collection of objects based on user-specified criteria (*filter_expression*). The following rules apply:

- The *filter_expression* can be created by combining several object properties using the following relational and logical operators: >, <, ==, !=, <=, >=, &&, ||, =~, !~, AND, OR. You also can use parentheses to create expressions.
- You can use the defined and undefined existence operators to determine whether an attribute is defined for an object.
- All design object properties supported through the get_property command can be used for filtering the base collection.

Note: You also can perform filtering operations by specifying the -filter parameter with the get_* commands.

Parameters

-help	Prints out the command usage.
base_collection	Specifies the collection of objects from which to filter objects for the new collection.
filter_expression	Specifies the criteria with which to filter objects. The software adds any objects in the base collection that match *filter_expression* to the new collection. See "Examples" on how to create filter expressions.
-nocase	Specifies that pattern matching is not case sensitive. **Note:** You must specify -regexp in order to use this parameter.
-quiet	Suppresses all the error and warning messages that are generated when the filter_collection command is run.
-regexp	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as a wildcard.

Examples

- The following command returns a single-object collection containing the pin with the hierarchical name lat_3/Q:
  ```
  filter_collection [get_pins] {hierarchical_name == lat_3/Q}
  ```
- The following command returns a collection of pins that have a maximum slew that is greater than 0.1:
  ```
  filter_collection [get_pins] {slew_max_rise > 0.1}
  ```
- The following commands create a new collection called newPaths that contains all of the paths from the collection paths that have a slack value that is greater than -0.806 and less than 0.0:
  ```
  set paths [report_timing -collection -max_paths 10]
  set newPaths [filter_collection $paths {(slack > -0.806 && slack < 0.0)}]
  ```
- The following example creates a pin type user property to annotate useful_skew values which may be used in custom functions for analysis and implementation:
  ```
  define_property useful_skew -type float -object_type pin
  set_interactive_constraint_modes [all_constraint_modes -active]
  ```
  You can now apply some values to a few register clock pins:
  ```
  set_property [get_pin hier1/reg1/clock] useful_skew 1.5
  set_property [get_pin hier1/hier2/reg2/clock] useful_skew 2.5
  ```

In the script, you can look for pin objects that have (or does not have) this attributed applied:

```
find clock pins without useful skew
set pins_without_useful [filter_collection [all_registers -clock_pins] \
"undefined(useful_skew)"]
count the number of registers with useful skew applied
set pins_with_useful [filter_collection [all_registers -clock_pins] \
"defined(useful_skew)"]
```

- The following command returns a collection of object names that do not match with “*clk*”:

```
filter_collection $abc {full_name !~ *clk*}
out in1 in2 in3 select TopBus[2] TopBus[1] TopBus[0] bidi
0x53
```

- The following command returns a collection of object names that are not “*clk*” only:

```
filter_collection $abc {full_name != *clk*}
out clk1 clk2 in1 in2 in3 select TopBus[2] TopBus[1] TopBus[0] bidi
0x59
```

- The following command returns a collection of object names that match with “*clk*”:

```
filter_collection $abc {full_name =~ *clk*}
clk1 clk2
0x5f
```

Related Information

- add_to_collection
- compare_collections
- copy_collection
- foreach_in_collection

foreach_in_collection

```
foreach_in_collection
[-help]
var_name
collection
body
```

Iterates through all objects in the specified collection and executes the commands in the specified script.

Parameters

`-help`	Prints out the command usage.
body	Specifies the script of commands to execute during each iteration.
collection	Specifies the collection of objects through which to iterate.
var_name	Specifies the iterator variable. During each iteration, *var_name* is set to a collection of exactly one object. Any command that accepts collections can accept *var_name* as a value.

Examples

- A script with the following commands would print out the hierarchical names of all of the cells in the design:

```
foreach_in_collection iCell [get_cells *] {
puts "Cell = [get_property $iCell hierarchical_name]"

    }
    Cell = ck_0
    Cell = ck_1
    Cell = ck_2
    Cell = ck_4
```

- The following example shows a more complex use of the `foreach_in_collection` command.

```
set cellCollection [get_cells temp1_reg]
set libCellCollection [get_lib_cells -of_objects $cellCollection]
set libArc [get_lib_arcs -of_objects $libCellCollection]

foreach_in_collection arc $libArc {
set fpin [get_property $arc from_lib_pin]

set tpin [get_property $arc to_lib_pin]
set sense [get_property $arc timing_type]

set from_pin_name [get_property $fpin name]
set to_pin_name [get_property $tpin name]

puts [format "%25s -> %25s %-20s" $from_pin_name $to_pin_name $sense]
}
```

```

get_activity

```
get_activity
[-help]
[-instance <string>]
[-list_of_nets_based_on_driver <string>]
[-list_of_nets_based_on_source_of_activity_info <string>]
[-net <string>]
[-outfile <string>]
[-pin <string>]
[-port <string>]
[-report_average_switching_activity]
[-report_cell_group_activity_summary_report]
[-summary]
[-tcl_list]
```

Determines the source of activity for the specified nets/pins/ports. The power analysis engine has various sources from where activities can be annotated from, such as switching activity specification (input/sequential/global/clock gate), clock definitions/constants through SDC/TWF, activity files (VCD/TCF/SAF), user defined activity and/or propagated values.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `get_activity` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_activity`
`-instance string`	
	Specifies the top/hierarchy instance or the leaf level instance name for which average activity is to be reported.
`-list_of_nets_based_on_driver {primary_inputs | sequential | combinational | memory | ICG | black_box}`	
	Specifies to output the list of nets based on the specified net driver. You can specify one or more net drivers at a time, as shown below: `get_activity -list_of_nets_based_on_driver primary_inputs|combinational| sequential | ICG | memory | black_box` To specify multiple drivers, you can use **/** (means 'or') or **&** (means 'and') between two drivers, without a space.
`-list_of_nets_based_on_source_of_activity_info {activity_file|set_switching_activity|propagated|default}`	
	Specifies to output the list of nets based on the specified activity source information.
`-net string`	Specifies the name of the net. **Note:** You can use the `get_nets` command to determine the activity source for a collection of nets.
`-outfile string`	Specifies the output file into which the activity sources are to be written.
`-pin string`	Specifies the name of the pin. **Note:** You can use the `get_pins` command to determine the activity source for a collection of pins.
`-port string`	Specifies the name of the port. **Note:** You can use the `get_ports` command to determine the activity source for a collection of ports.
`-report_average_switching_activity`	
	Specifies to report the average activity of the given instance/hierarchy/top-level.
`-report_cell_group_activity_summary_report`	
	Specifies to give a summary of cell group activity.

`-summary`	Generates a detailed activity annotation report of the specified nets, pins, and ports. This report contains the following information: • Primary Inputs • Sequential Outputs • Memory/Macro Outputs • Tristate Outputs **Note:** Use the `get_activity -summary` command to report activity annotation summary without printing information for nets/pins/ports.
`-tcl_list`	Produces the report in the Tcl list format instead of a tabular format. The `-tcl_list` and `-outfile` parameters are mutually exclusive; you cannot specify them together.

The activity report for pins is displayed in the following format:

```
<Pin Name> <Source of the Activity Value> <Duty Cycle> <Toggles/Sec>
```

The report fields are described below:

- `Pin Name`: Name of the specified pins.
- `Source of the Activity Value`: Source of activity for the specified nets, pins, or ports.
- `Duty Cycle`: Probability of signal at 1.
- `Toggles/Sec`: Number of toggles divided by the total simulation time.

Examples

- The following example returns the activity sources of all nets that match the specified pattern and writes the output information to a file named `nets.rpt`:

  ```
  get_activity -net [get_nets n*] -outfile nets.rpt
  ```

  The following is the example output of the nets.rpt file:

  ```
  int3 activity_file 0.5 5e+07
  int2 sequential_activity 0.5 2.5e+07
  int1 user_defined_activity 0.5 1e+07
  nt3 global_activity 0.5 5e+07
  nt3 input_activity 0.5 5e+07
  int5 clock_gate_activity 0.5 2.5e+07
  int1 user_defined_activity 0.5 1e+07out
  sequential_activity 0.5 2.5e+07
  clk sdc/twf 0.5 5e+08
  c_int2 propagation 0.5 5e+08
  ```

- The following example returns the activity source of the pin `i_4/A1` and writes the output information to a power report file named `pin.rpt`:

  ```
  get_activity -pin i_4/A1 -outfile pin.rpt
  ```

- The following command report the average activity of all nets:

  ```
  get_activity -report_average_switching_activity
  ```

  The following is the example output:

  ```
  Avg Switching activity of all nets 4.727e+17
  ```

- The following command gives a summary of cell group activity:

  ```
  get_activity -report_cell_group_activity_summary_report
  ```

  The following is the example output:

  ```
  Group Activity Summary Report:
  Source ->                   activity file           set_switching_activity   propagated              default                 Total
  All nets                    2                       1                        2                       5
  10
  Break-up based on net driver:
  Primary Input               2(40%)                  0(0%)                    0(0%)                   3(60%)
  5
  Sequential                  0(0%)                   1(33.33%)                0(0%)                   2(66.67%)
  3
  Combinational               0(0%)                   0(0%)                    2(100%)                 0(0%)
  2
  ```

```
Memory                    0(0%)                0(0%)                0(0%)                0(0%)
0
ICG                       0(0%)                0(0%)                0(0%)                0(0%)
0
Black Box                 0(0%)                0(0%)                0(0%)                0(0%)              0
```

- The following command gives the list of nets based on primary inputs:
  `get_activity -list_of_nets_based_on_driver primary_inputs`
  The following is the example output:
  `D2 D1 CP2 CP1 dummy0`
- The following command gives the list of nets based on primary inputs or sequential driver:
  `get_activity -list_of_nets_based_on_driver primary_inputs|sequential`
  The following is the example output:
  `Q2 Q1 D2 D1 CP2 CP1 n1 dummy0`
- The following command gives the list of nets based on primary inputs or sequential driver for the instance `ff1b`:
  `get_activity -list_of_nets_based_on_driver primary_inputs|sequential -instance ff1b`
- The following command gives the list of nets based on the propagated source for the instance `i2`:
  `get_activity -list_of_nets_based_on_source_of_activity_info propagated -instance i2`
- The following command gives a summary of cell group activity for the instance `i2`:
  `get_activity -instance i2 -report_cell_group_activity_summary_report`
- The following command gives the list of nets based on the default activity:
  `get_activity -list_of_nets_based_on_source_of_activity default`

  The following is the example output:
  `rst shutdown isolate coef_ld start bypass test_mode se sdi Xn_in[3] Xn_in[2] Xn_in[1] Xn_in[0]`
  `Yn_in[15] Yn_in[14] Yn_in[13] Yn_in[12] Yn_in[11] Yn_in[10] Yn_in[9] Yn_in[8] Yn_in[7] Yn_in[6]`
- The following command gives the list of nets based on the activity file:
  `get_activity -list_of_nets_based_on_source_of_activity activity_file`

  The following is the example output:
  `ref_clk test_clk pll_clk`
- The following command gives the list of nets based on the switching activity:
  `get_activity -list_of_nets_based_on_source_of_activity set_switching_activity`

  The following is the example output:
  `rst ref_clk shutdown isolate coef_ld start bypass test_clk test_mode se sdi sdo Xn_in[3] Xn_in[2]`
  `Xn_in[1] Xn_in[0] Yn_in[15] Yn_in[14] Yn_in[13]`

get_arcs

```
get_arcs
[-help]
{ [-to to_list] [-from from_list]
 | -of_objects object_list}
[-filter expr]
[-quiet]
```

Creates a collection of timing arcs. Assign these arcs to a variable, or pass them to another command. If no objects match the criteria, an empty collection is returned.

Note: The timing graph must be built before you can use this command. A warning message is issued indicating that the timing graph is not generated.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters a collection based on the specified expression. For any arcs that match the pattern, the software evaluates the expression based on the attribute of the arc. For details on how to create filter expressions, refer to the `filter_collection` command.
`-from from_list`	Adds all timing arcs that fan in directly to the specified pins or ports to the collection. You can specify a list of pins or a list of ports, but you cannot specify a list that contains both pins and ports. You can specify a pattern for the pin or port name, a collection of pins or ports, or a pattern and a collection. **Note:** You cannot specify this parameter with the `-of_objects` parameter.
`-of_objects object_list`	Adds all timing arcs that are associated with the specified cells or nets to the collection. You can specify a list of cells or a list of nets, but you cannot specify a list that contains both cells and nets. You can specify a pattern for the cell or net name, a collection of cells or nets, or a pattern and a collection. **Note:** You cannot specify this parameter with the `-to` or `-from` parameters.
`-quiet`	Suppresses all error and warning messages generated when the `get_arcs` command is run.
`-to to_list`	Adds all timing arcs that fan out directly from the specified list of pins or ports to the collection. You can specify a list of pins or a list of ports, but you cannot specify a list that contains both pins and ports. You can specify a pattern for the pin or port name, a collection of pins or ports, or a pattern and a collection. **Note:** You cannot specify this parameter with the `-of_objects` parameter.

Examples

- The following command returns a collection of the timing arcs fan in directly to the pin `dff1/CP`:
  ```
  get_arcs -from dff1/CP
  ```
- The following command creates a collection of the timing arcs that are associated with the nets in the specified collection:
  ```
  get_arcs -of_objects [get_nets {n1}]
  ```

Related Information

- `get_property`

get_cells

```
get_cells
[-help]
[-hierarchical]
[-hsc char]
[-filter expr]
[-leaf]
[-regexp]
[-nocase]
[-quiet]
[<patterns> | -of_objects <object_list>]
```

Creates a collection of instances in the current design whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument in another command.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any cells that match the pattern, the software evaluates the expression based on the attribute of the cell. You can filter cells using any of the cell properties supported through the `get_property` command. For details on how to create filter expressions, refer to the `filter_collection` command.

`-hierarchical`	Specifies that the patterns should be matched hierarchically. If the flat name of an instance at a particular hierarchical level matches the patterns, it is included in the result. For example. if there is top level hierarchical instance `Top` and it contains another sub-instance called `FF1`, then the following command can be used to get the instance `Top/FF1` (since the given pattern will be matched with instance flat name `FF1`):
	`get_cells -hier FF*`
	However, the following command will display an error:
	`get_cells -hier Top/FF*`

`-hsc char`	Specifies the hierarchical delimiter for patterns. For example, if the hierarchical delimiter is `@`, the `sub/I1@I2` pattern matches instance `I2` within the hierarchy limited at `sub/I1`.
`-leaf`	Returns leaf cells only. When the `-leaf` parameter is not specified, the `get_cells` command returns the hierarchical instances present on a net along with the flat instances at the same hierarchical level as the specified object. **Note:** The `-leaf` parameter can only be specified with the `-of_objects` parameter.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.

`-of_objects object_list`	Creates a collection of all cells associated with the specified pins, nets, library cells, or design cells.
	You can specify a list of pins or a list of nets, but you cannot specify a list that contains both pins and nets. You can specify patterns for the pin or net names, a collection of pins or nets, or a combination of patterns and a collection.
	The `-of_objects` parameter supports `get_designs` and `get_lib_cells` as valid collection objects.
	The use model is as follows:
	`get_cells -of_objects [get_designs object_list]`
	`get_cells -of_objects [get_lib_cells object_list]`

`patterns`	Specifies patterns for instance names. Patterns include the `*` and `?` wildcard characters and collections of instances. The `get_cells` command returns a collection of instances that match the patterns. If no such instance is found, an empty collection is returned.
`-quiet`	Suppresses all error and warning messages generated when the `get_cells` command is run.

`-regexp`	Treats the specified patterns as a regular expression patterns.
	When this parameter is specified, the given patterns `start` and `end` are assumed to be matching with the start and end part of the complete object name.
	For example, the following can be used to retrieve the hierarchical instance `Top/block1/block2/FF1`:
	`get_cells Top/*/*/FF1`
	`get_cells -regexp Top/.*/FF1`
	However, the following command will display an error :
	`get_cells Top/*/FF1`
	If this parameter is specified with `-hier` parameter, the given pattern will be matched with the complete hierarchical name of objects instead of only the flat name and all the successful matches are included in the result.
	For example, if there is a top level hierarchical instance `Top` and it contains another sub-instance called `FF1`, then either of these can be used to retrieve `Top/FF1` instance:
	`get_cells -hier FF1`
	`get_cells -hier -regexp Top/FF1`
	However, the following commands will display an error :
	`get_cells -hier Top/FF1`
	`get_cells -hier -regexp FF1`

Example

- The following command searches for pins within the hierarchy limited at `B`:
  `get_cells -hsc @ B@*`
- The following command searches for cells with set pattern and filter:
  `get_cells "o*" -filter "@ref_lib_cell_name != FD2 && @is_black_box==false"`

get_clocks

```
get_clocks
[-help]
[-filter expr ]
[-regexp]
[-nocase]
[-quiet]
[ patterns ]
```

Returns a collection of clocks whose names match the supplied patterns, filtered by the filter expression.

With no filter expression, the `get_clocks` command reports all clocks that match *patterns*, including inactive clocks.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any clocks that match the pattern, the software evaluates the expression based on the attribute of the clock. You can filter clocks using any of the clock properties supported through the `get_property` command. For details on how to create filter expressions, refer to the `filter_collection` command.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
patterns	Specifies patterns for clock names. Patterns include the `*` and `?` wildcard characters, and collections of instances and clocks. This can either be a single *pattern* or a list of *patterns*
`-quiet`	Suppresses all the error and warning messages generated when the `get_clocks` command is run.
`-regexp`	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as a wild card

Example

- The following example returns all clocks beginning with the name `CK`:
  ```
  get_clocks CK*
  ```
- The following example returns a collection of all clocks beginning with the name CK and Clk:
  ```
  get_clocks [ list CK* Clk* ]
  ```
- The following example returns a collection of all active clocks beginning with the name CK:
  ```
  get_clocks CK* -filter {is_active == true}
  ```

Related Commands

- `all_clocks`
- `create_clock`
- `get_pins`
- `get_ports`
- `report_clocks`

get_designs

```
get_designs
[-help]
[-quiet]
patterns
```

Creates a collection of modules and assigns this collection to a variable or pass it as an argument to an another command. The software uses this information during timing analysis.

Parameters

`-help`	Prints out the command usage.
patterns	Specifies patterns for module names. Patterns include the `*` and `?` wildcard characters and collections of modules. The `get_designs` command returns a collection of modules that match the patterns. If no such module is found, an empty collection is returned.
`-quiet`	Suppresses all error and warning messages generated when the `get_design` command is run.

Example

- The following command returns a complete list of modules:
  ```
  get_designs *
  ```

get_generated_clocks

```
get_generated_clocks
[-help]
[-filter expr]
[-regexp | -exact]
[-nocase]
[patterns]
```

Creates a collection of generated clocks whose name matches the supplied pattern list. Assign this collection to a variable, or pass it as an argument to another command.

Parameters

`-help`	Prints out the command usage.
`-exact`	Performs exact pattern matching against the object name, instead of wild card or regular expression matching. Use this parameter when the object name includes special characters such as `*`, `?`, and `+`. **Note:** If you specify this parameter, you cannot specify `-regexp`.
`-filter expr`	Filters the collection with the specified expression. For any clocks that match the pattern, the software evaluates the expression based on the attribute of the clock. For details on how to create filter expressions, refer to the `filter_collection` command.
`-nocase`	Specifies that pattern matching is not case sensitive.
patterns	Specifies patterns for generated clock names. Patterns include the `*` and `?` wildcard characters, and collections of generated clocks.
`-regexp`	Treats the specified pattern as a regular expression. *Default:* Treats the specified pattern as a wild card **Note:** If you specify this parameter, you cannot specify `-exact`.

Examples

- The following command returns the collection of all the generated clocks present in the design whose name starts with "CK":

```
get_generated_clocks CK*

CKGEN1 CKGEN2 CKGEN3
```

get_lib_arcs

```
get_lib_arcs
[-help]
{ [-to to_lib_pins] [-from from_lib_pins]
  | -of_objects {lib_cell_list | timing_arcs} }
[-filter expr]
[-quiet]
```

Creates a collection of library timing arcs. Assign these library timing arcs to a variable, or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any library arcs that match the pattern, the software evaluates the expression based on the attribute of the library arc. For details on how to create filter expressions, refer to the `filter_collection` command.
`-from from_lib_pins`	Creates a collection of all library arcs that originate from the specified library pins. You can specify a pattern for the pin name, a collection of pins, or a pattern and a collection. If you specify this parameter with the `-to` parameter, the software creates a collection of all library arcs that exist between the "to" and "from" library pins. **Note:** You cannot specify this parameter with the `-of_objects` parameter.
`-of_objects {lib_cell_list | timing_arcs}`	Creates a collection of all library arcs that are associated with the specified library cells or timing arcs. You can specify a list of library cells or a list of timing arcs, but you cannot specify a list that contains both library cells and timing arcs. You can specify a pattern for the library cell or timing arc name, a collection of library cells or timing arcs, or a pattern and a collection. **Note:** You cannot specify this parameter with the `-to` or `-from` parameters.
`-quiet`	Suppresses all error and warning messages generated when the `get_lib_arcs` command is run.
`-to to_lib_pins`	Creates a collection of all library arcs that terminate at the specified library pins. You can specify a pattern for the pin name, a collection of pins, or a pattern and a collection. If you specify this parameter with the `-from` parameter, the software creates a collection of all library arcs that exist between the "to" and "from" library pins. **Note:** You cannot specify this parameter with the `-of_objects` parameter.

Examples

- The following command reports the timing type off all the timing arcs of the flop 'DFF':

  ```
  get_property [get_lib_arcs -of_objects DFF] timing_type
  ```

  Sample output:

  ```
  minimum_period minimum_period min_pulse_width min_pulse_width setup_rising hold_rising rising_edge rising_edge
  ```

Related Information

- `report_lib_arcs`
- `get_lib_cells`
- `get_lib_pg_pins`
- `get_lib_pins`
- `get_libs`

get_lib_cells

```
get_lib_cells
[-help]
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
{pattern_list | -of_objects object_list}
```

Creates a collection of library cells from the loaded libraries whose name matches the supplied pattern list. Assign these library cells to a variable or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any library cells that match the pattern, the software evaluates the expression based on the attribute of the library cell. You can filter library cells using any of the library cell properties supported through the `get_property` command. For details on how to create filter expressions, refer to the `filter_collection` command.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects object_list`	Creates a collection of all library cells associated with the specified library pins or cells or libs. You can specify a list of library pins or a list of cells or a list of libs, but you cannot specify a list that contains mixed of library pins and cells and libs. You can specify patterns for the library pin or cell or lib names, a collection of library pins or cells or libs, or a combination of patterns and a collection.
`pattern_list`	Returns only those libraries in the collection whose name matches one or more of the patterns specified in the `pattern_list` argument. The characters `?` and `*` are wild cards. The `?` character matches any one character while the `*` character matches zero or more characters. If a library matches multiple patterns, it appears multiple times in the collection. A pattern can have only one hierarchical separator character. The left part of the pattern is the library name pattern and the right part is the cell name pattern. If there is no separator character, the pattern is compared to cell names in all the libraries. A pattern can have only one hierarchical separator character, dividing the pattern into one or two parts. If the hierarchical separator is `/`, the alternatives are: • `cell_name_pattern` Selects all cells whose name matches the `cell_name_pattern` from all libraries. • `lib_name_pattern/cell_name_pattern` Selects all cells whose name matches the `cell_name_pattern` from all libraries whose name matches the `lib_name_pattern`.
`-quiet`	Suppresses all error and warning messages generated when the `get_lib_cells` command is run.
`-regexp`	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as wildcard

Examples

- The following command prints all cells for all libraries:
  ```
  get_lib_cells *
  ```
- The following command prints a collection with all cells in the `lca500kv` lib library:
  ```
  get_lib_cells lca500kv/*
  ```
- The following command prints a collection with all cells whose names starts with `AN` in all libraries starting with `lca`:
  ```
  get_lib_cells lca*/AN*
  ```
- The following command disables delay arcs on the `EF11L050032A` library cell. The `set_disable_cell_timing` command effects all instantiations of the

specified cell, and lets you disable delay arcs from and to internal pins.

```
set_disable_timing -from WACLK -to RBO1 [get_lib_cells {EF11L050032A}]
```

Related Information

- get_cells
- get_libs
- get_lib_pins

get_lib_pg_pins

```
get_lib_pg_pins
[-help]
[-filter expr]
{-of_objects object_list}
```

Returns a collection of library-level PG pins from the loaded libraries. An empty collection is returned if no PG pin definitions are found in the loaded library.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any library pg pins that match the specified expression, the software evaluates the expression based on the attribute of the library pg pin. You can filter library pg pins along with the `-of_objects` parameter - using the library pg pin properties of `lib_pg_pin` object type (supported through the `get_property` command). For details on how to create filter expressions, refer to the `filter_collection` command.

`-of_objects object_list`	Creates a collection of all library PG pins associated with the specified library cells.
	The `-of_objects` parameter supports `get_lib_cells` as valid objects.
	For example,
	`get_lib_pg_pins -of_objects [get_lib_cells sc9_cmos32lp/DFFQ_X1M] VDD VSS`
	`get_lib_pg_pins *`
	`**ERROR: (TCLCMD-1420): Currently only -of_objects option is supported`

Examples

- The following command gets the collection of all the library-level pg pins of the specified library cell:
  `get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]`
- The following command filters the collection of all library-level pg pins of the library cell to return only the library pg pins containing the string name defined with the lib_pg_pin name attribute:
  `get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X] -filter "name =~ *VDD*"`

Related Information

- `get_lib_pins`
- `get_libs`

get_lib_pins

```
get_lib_pins
[-help]
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
{pattern_list | -of_objects object_list}
```

Creates a collection of library cell pins from the loaded libraries whose name matches the supplied pattern list. Assign these library cell pins to a variable or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any library cell pins that match the pattern, the software evaluates the expression based on the attribute of the library cell pin. You can filter library pins using any of the library pin properties supported through the `get_property` command. For details on how to create filter expressions, refer to the `filter_collection` command.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects object_list`	Creates a collection of all library pins associated with the specified library cells or pins. You can specify a list of cells or a list of pins, but you cannot specify a list that contains both cells and pins. You can specify patterns for the cell or pin names, a collection of cells or pins, or a combination of patterns and a collection.
pattern_list	Returns only those libraries in the collection whose name matches one or more of the patterns specified in the *pattern_list* argument. The characters `?` and `*` are wild cards; The `?` character matches any one character while the `*` character matches zero or more characters. If a library cell matches multiple patterns, it appears multiple times in the collection. A pattern can have only two hierarchical separator characters, dividing the pattern into one, two, or three parts. If the hierarchical separator is `/`, the alternatives are: • *pin_name_pattern* Selects all pins whose name matches the *pin_name_pattern* from all cells in the libraries. • *cell_name_pattern/pin_name_pattern* Selects all pins whose name matches the *pin_name_pattern* from all cells whose name matches the *cell_name_pattern* in all libraries. • *lib_name_pattern/cell_name_pattern/pin_name_pattern* Select all pins whose name matches the *pin_name_pattern* from all cells whose name matches the *cell_name_pattern* from all libraries whose name matches the *lib_name_pattern*.
`-quiet`	Suppresses all error and warning messages generated when the `get_lib_pins` command is run.
`-regexp`	Treats the specified patterns as a regular expression patterns. *Default:* Treats the specified pattern as a wild card

Examples

- The following command returns all pins in all cells for all libraries:
  `get_lib_pins *`
- The following command returns a collection with all pins for cell `AO1` in any library:
  `get_lib_pins AO1/*`
- The following command returns a collection with all pins whose name starts with `Z` or `Q` for the `AO1` cell in any library: `get_lib_pins {AO1/Z* AO1/Q*}`
- The following command returns a collection with all pins for the `AO1` cell in the `lca500kv` lib library:

```
get_lib_pins lca500kv/AO1/*
```

- The following command returns a collection with all pins starting with `Z` in all cells whose names starts with `AN` in all libraries starting with `lca`:

```
get_lib_pins lca*/AN*/Z*
```

Related Information

- get_libs
- get_lib_cells

get_libs

```
get_libs
[-help]
[-filter expr]
[-quiet]
[-regexp]
[-nocase]
{-of_objects object_list | pattern_list}
```

Creates a collection of loaded libraries whose name matches those specified in the pattern list. Assign these libraries to a variable or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any libraries that match the pattern, the software evaluates the expression based on the attribute of the library. You can filter libraries using any of the library properties supported through the `get_property` command. For details on how to create filter expressions, refer to the `filter_collection` command.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects object_list`	Creates a collection of libraries that belong to the library cells in a given object list.
pattern_list	Returns only those libraries in the collection whose name matches one or more of the patterns specified in the *pattern_list* argument. The characters `?` and `*` are wild cards; The `?` character matches any one character while the `*` character matches zero or more characters. If a library matches multiple patterns, it appears multiple times in the collection.
`-quiet`	Suppresses all error and warning messages generated when the `get_lib_cells` command is run.
`-regexp`	Treats the specified patterns as a regular expression patterns. *Default:* Treats the specified pattern as a wild card

Examples

- The following command displays a list of loaded libraries starting with a or l:
  ```
  get_libs {a* l*}
  ```
- The following command queries all libraries beginning with the letter `l`:
  ```
  get_libs l*
  ```
- The following command creates a collection of libraries that are associated with the library cells in the specified object list:
  ```
  get_libs -of_objects [get_lib_cells *]
  ```

Related Information

- `get_lib_cells`
- `get_lib_pins`

get_nets

```
get_nets
[-help]
[-hierarchical]
[-hsc char]
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
[patterns | -of_objects object_list]
```

Creates a collection of nets in the current design whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument to an another command. If no such net is found, an empty collection is returned.

When you use the `get_nets` command to specify hierarchical nets, the software matches the specified pattern and returns the top level net connected to it.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any nets that match the pattern, the software evaluates the expression based on the attribute of the net. You can filter nets using any of the net properties supported through the `get_property` command. For details on how to create filter expressions, refer to the `filter_collection` command.
`-hierarchical`	Specifies that the patterns should match hierarchically. If the hierarchical name of a net at any hierarchical level matches the patterns, it is included in the result.
`-hsc char`	Specifies the hierarchical delimiter for patterns.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects object_list`	Creates a collection of all nets associated with the specified cells, pins, or ports. You can specify a list of cells, a list of pins, or a list of ports, but you cannot specify a list that contains cells, pins, and ports together. You can specify patterns for the cell, pin, or port names, a collection of cells, pins, or ports, or a combination of patterns and a collection.
`patterns`	Specifies patterns for net names. Patterns include the `*` and `?` wildcard characters and collections of nets.
`-quiet`	Suppresses all error and warning messages generated when the `get_nets` command is run.
`-regexp`	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as wildcard

Examples

- The following command returns all nets within the hierarchy limited at `A`:
  ```
  get_nets -hsc @ A@*
  ```
- The following command returns all patterns that match hierarchy and identifies nets to be excluded from optimization.
  ```
  get_nets * -hierarchical -filter "@dont_touch== true"
  ```

Related Information

- `get_pins`

get_object_name

```
get_object_name
[-help]
collection
```

Returns the name of the object(s) contained in the specified collections.

By default, the command hides escape characters in the output. To enable printing of escape characters in the output, you can set `timing_enable_get_object_escaped_name_backward_compatible` global variable to `true`.

Parameters

`-help`	Prints out the command usage.
`collection`	Specifies multiple object collection that contain the objects.

Examples

- The following command returns a tcl list of names which can match the collection inputs:
  ```
  get_object_name [get_cells and*]
  ```
- The following command defines a variable called `endpoint_list` to store endpoints with the ten worst slacks:
  ```
  set endpoint_list [get_object_name [get_property \

        [report_timing -collection -max_points 10] capturing_point]]
  ```

Related Commands

- `query_objects`

get_path_groups

```
get_path_groups
[-help]
[-regexp]
[-nocase]
patterns
```

Creates a collection of path groups whose name matches those specified in the pattern list. Assign these path groups to a variable, or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

`-help`	Prints out the command usage.
`-nocase`	Specifies that pattern matching is not case sensitive.
patterns	Creates a collection of path groups whose name matches one or more of the specified patterns. Patterns include the `*` and `?` wildcard characters and collections of path groups. If a path group matches multiple patterns, it appears multiple times in the collection.
`-regexp`	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as wildcard

Examples

- The following command returns a collection of all the path groups present in the design:
  ```
  get_path_groups *
  ```

  Sample output:
  ```
  reg2reg reg2gate
  ```

Related Information

- `group_path`
- `reset_path_group`

get_pg_nets

```
get_pg_nets
[-help]
[-filter expr]
[-of_objects object_list]
```

Creates a collection of netlist-level instance PG nets of leaf cells/pins in the current design. An empty collection is returned if no PG net definitions/connections are found in the design netlist.

Parameters

`-help`	Prints out the command usage.
`-filter` *expr*	Specifies the filters for the collection with the specified expression. For any pg nets that match the pattern, the software evaluates the expression based on the attribute of the net. You can filter pg nets along with the `-of_objects` parameter - using any of the pg net properties of object type `pg_net` (supported through the `get_property` command). For details on how to create filter expressions, refer to the `filter_collection` command.

`-of_objects` *object_list*	Creates a collection of all the PG nets, or PG nets associated with the specified cells or PG pins.
	You can specify a list of cells or a list of pg pins, but you cannot specify a list that contains cells and pg pins together.
	The `-of_objects` parameter supports `get_cells` and `get_pg_pins` as valid objects.
	For example,
	`get_pg_nets -of_objects [get_cells iA/out_reg] VSS VDD2`
	`get_pg_nets -of_objects [get_pg_pins -of_objects [get_cells iA/out_reg]] VSS VDD2`
	`get_pg_nets *`

Examples

- The following command filters the collection of all pg nets of the cell instance object to return only the pg nets containing the string name defined with the pg_net hierarchical_name attribute:
  ```
  get_pg_nets -of_objects [get_cells iA/out_reg] -filter "hierarchical_name =~ *VDD*"
  ```
- The following command gets the collection of all pg nets of the cell instance object:
  ```
  get_pg_nets -of_objects [get_cells iA/out_reg]
  ```
- The following command gets the collection of all pg nets of the pg_pins of the cell instance object:
  ```
  get_pg_nets -of_objects [get_pg_pins -of_objects [get_cells iA/out_reg]]
  ```

Related Information

- `get_pg_pins`
- `get_pins`

get_pg_pins

```
get_pg_pins
[-help]
[-filter expr]
[-of_objects object_list]
```

Returns a collection of netlist-level instance PG pins in the current design. An empty collection is returned if no PG pin definitions are found in the design netlist.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Specifies the filters for the collection with the given expression. For any pg pins that match the pattern, the software evaluates the expression based on the attribute of the pin. You can filter pg pins along with the `-of_objects` parameter - using the pg pin properties of object type `pg_pin` (supported through the `get_property` command). For details on how to create filter expressions, refer to the `filter_collection` command.

`-of_objects object_list`	Specifies the collection of all the pins associated with the specified cells or nets.
	The `-of_objects` parameter supports `get_cells` as valid objects.
	For example:
	`get_pg_pins -of_objects [get_cells iA/out_reg] iA/out_reg/VSS iA/out_reg/VDD`
	`get_pg_pins iA/out_reg/VDD`
	`**ERROR: (TCLCMD-1420): Currently only -of_objects option is supported.`

Examples

- The following command filters the collection of all the pg_pins of the cell instance object to return only the pg pins containing the string name defined with the pg_pin hierarchical_name attribute:
  ```
  get_pg_pins -of_objects [get_cells iA/out_reg] -filter "hierarchical_name =~ *VDD*"
  ```
- The following command gets the collection of all pg pins of the cell instance object:
  ```
  get_pg_pins -of_objects [get_cells iA/out_reg]
  ```

Related Information

- `get_pg_nets`
- `get_pins`

get_pins

```
get_pins
[-help]
[-hierarchical]
[-hsc char]
[-filter expr]
[-leaf]
[-regexp]
[-nocase]
[-quiet]
{patterns | -of_objects object_list}
```

Creates a collection of instance pins whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument to another command. If no such pin is found, an empty collection is returned.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any pins that match the pattern, the software evaluates the expression based on the attribute of the pin. If the expression is set to true, the pin is included in the result. You can filter pins using any of the pin properties supported through the `get_property` command. For details on how to create filter expressions, refer to the `filter_collection` command.
`-hierarchical`	Specifies that patterns should match hierarchically. If the hierarchical name of a pin at any hierarchical level matches the patterns, it is included in the result.
`-hsc char`	Specifies the hierarchical delimiter for patterns.
`-leaf`	Returns leaf pins only. When the `-leaf` parameter is not used, the `get_pins` command returns the hierarchical pins present on a net along with the flat pins at the same hierarchical level as the specified object.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects object_list`	Creates a collection of all pins associated with the specified cells or nets. You can specify a list of cells or a list of nets, but you cannot specify a list that contains both cells and nets. You can specify patterns for the cell or net names, a collection of cells or nets, or a combination of patterns and a collection.
patterns	Specifies patterns for pin names. Patterns include the `*` and `?` wildcard characters and collections of pins.
`-quiet`	Suppresses all error and warning messages generated when the `get_pins` command is run.
`-regexp`	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as wildcard

Examples

- The following command returns all instance pins within the hierarchy limited at `A`:

  ```
  get_pins -hsc @ A@*
  ```

- The following command filters the collection for `pin_direction` pin attribute.

  ```
  get_pins "in*" -filter "@pin_direction == in"
  ```

Related Information

- create_clock
- get_cells
- get_ports
- get_pg_nets
- get_pg_pins
- get_property

get_ports

```
get_ports
[-help]
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
[patterns | -of_objects object_list]
```

Creates a collection of ports whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument to another command.

Note: The `get_ports` command always creates a collection of top level ports irrespective of the current instance set using the `current_instance` command.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any ports that match the pattern, the software evaluates the expression based on the attribute of the port. If the expression is set to true, the port is included in the result. You can filter ports using any of the port properties supported through the `get_property` command. For details on how to create filter expressions, refer to the `filter_collection` command.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects object_list`	Creates a collection of all ports associated with the specified nets. You can specify patterns for the net names, a collection of nets, or a combination of patterns and a collection.
patterns	Specifies patterns for port names. Patterns include the `*` and `?` wildcard characters and collections of ports.The command returns a collection of ports that match the patterns. If no such port is found, an empty collection is returned.
`-quiet`	Suppresses all error and warning messages generated when the `get_ports` command is run.
`-regexp`	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as wildcard.

Examples

- The following example returns all ports beginning with the name `inb`:
  ```
  get_ports inb*
  ```
- The following command filters the collection for `port_direction` port attribute:
  ```
  get_ports "mode*" -filter {port_direction == in}
  ```

Related Commands

- `get_clocks`
- `get_pins`
- `create_clock`
- `get_cells`
- `get_property`

get_power

```
get_power
[-help]
[-outfile filename]
[-nets nets_list | -pins pins_list | -instances instances_list]
[-attribute attributes_list]
[-include_unit]
[-tcl_list ]
[-pg_net {pg_net_name_list | all}]
```

Queries various power related properties of design objects like nets, pins, and instances. Using this command, you can retrieve power attributes, such as internal power, switching power, leakage power, total power, and toggle rate. This command is very useful for writing custom scripts.

Note: This command outputs toggle rates as N.A. if the clock domain information for a given net/pin/instance is not found.

Use this command after running the `report_power` or `restore_power_database` command.

Note: The `-nets`, `-pins`, and `-instances` parameters are mutually exclusive. You must specify only one of the parameters.

Parameters

`-help`	Prints out the command usage.
`-attribute attributes_list`	Specifies a list of power attributes. If an attribute is not available for the specified design object, the software returns its value as NA. See List of Power Attributes for a mapping of the list of available attributes with the design objects. This is a required parameter.
`-include_unit`	Specifies to include the units for the power attributes.
`-instances instances_list`	Specifies a list of instance names. The `-nets`, `-pins`, and `-instances` parameters are mutually exclusive. You must specify one, and only one, of the parameters. **Note:** You can use the `get_cells` command to determine the power attributes for a collection of instances.
`-nets nets_list`	Specifies a list of net names. The `-nets`, `-pins`, and `-instances` parameters are mutually exclusive. You must specify one, and only one, of the parameters. **Note:** You can use the `get_nets` command to determine the power attributes for a collection of nets.
`-outfile filename`	Specifies the output file into which the power related properties are to be written. The `-tcl_list` and `-outfile` parameters are mutually exclusive; you cannot specify them together.
`-pg_net {pg_net_name_list | all}`	
	Specifies to query various power-related properties of a specified power net for an instance. This parameter supports the argument all to query properties of all power nets connected to the instance. You must use the `-instances` parameter in conjunction with the `-pg_net` parameter. The `-pg_net` parameter supports the following attributes: `switching_power`, `internal_power`, `leakage_power`, `total_power`, and `dynamic_power`.
`-pins pins_list`	Specifies a list of pin names. The `-nets`, `-pins`, and `-instances` parameters are mutually exclusive. You must specify one, and only one, of the parameters. **Note:** You can use the `get_pins` command to determine the power attributes for a collection of pins.
`-tcl_list`	Produces the report in Tcl list format instead of a tabular format. The `-tcl_list` and `-outfile` parameters are mutually exclusive; you cannot specify them together.

The following power attributes can be queried for the design objects:

List of Power Attributes with Attribute Description

- `switching_power (net, inst)`: switching power of a net or instance
- `internal_power (inst)`: internal power of an instance
- `dynamic_power (inst)`: switching and internal power of an instance
- `leakage_power (inst)`: leakage power of an instance
- `total_power (inst)`: total power of an instance
- `toggle_rate (net, pin, inst)`: Toggle rate - Number of toggles in the specified VCD/TCF in the duration
- `duty_cycle (net, pin)`: Static probability of the signal to stay high
- `ref_clock (net, pin, inst)`: Reference clock name (Fastest clock for multi clock domains)
- `ref_clock_period (net, pin, inst)`: Reference clock period
- `transition_density (net, pin)`: toggle_rate/ref_clock_period or toggle_rate*ref_clock_frequency
- `loading_cap (net, pin, inst)`: Loading capacitance
- `voltage (net, pin, inst)`: Operating voltage for a net or pin. For MSMV instance, this attribute can be used to get breakdown of domain specific power.
- `rise_slew (net, pin)`: Rise slew
- `fall_slew (net, pin)`: Fall slew
- `glitch_rate (net, pin)`: Glitch rate - Number of glitches per duration. Applies only to the vector-driven flow.
- `glitch_power (net, pin, inst)`: Glitch power. Applies only to the vector-driven flow.
- `activity_source (net, pin)`: Source of activity annotation. The options are: propagated, user_annotated, and constant.
- `pin_direction (pin)`: [input | output | inout]
- `cell_type (inst)`:Lists cell type as memory, standard cell, IO, sequential, and so on
- `all_attributes (net, pin, inst)`: Lists all related power attributes for the specified design object.

Examples

- The following command returns the specified power attributes for the net clock1:

  ```
  get_power -nets clock1 -attribute {switching_power internal_power toggle_rate}
  ```

  The following is the sample output:

  ```
  clock1 0.04 NA 2
  ```

- The following command returns the specified power attributes for all nets that match the specified pattern `master*`:

  ```
  get_power -nets [get_nets master*] -attribute {switching_power toggle_rate activity_source duty_cycle} -include_unit
  ```

  The following is the sample output:

  ```
  masterin[1] 0.001mW 0.2 user_annotated 0.5
  masterin[2] 0.002mW 0.2 user_annotated 0.5
  masterin[3] 0.003mW 0.1 propagated 0.5
  masterin[4] 0.005mW 1 constant 1
  ```

- The following command returns power-related properties of all power nets connected to the instance `clk_buf_1`:

  ```
  get_power -pg_net all -instances clk_buf_1 -attribute {switching_power internal_power leakage_power}
  ```

  The following is the sample output:

  ```
  clk_buf_1 VDD 0.002 0.001 0.000001
  clk_buf_1 VDDL 0.0001 0.0001 0.0000001
  ```

get_property

```
get_property
[-help]
var_name
property
[-clock clock_name]
[-view view_name]
[-quiet]
```

Retrieves the attribute value for the specified object(s) property.

You can query the following:

- Cell Properties
- Clock Properties
- Design Properties
- Library Properties
- Library Cell Properties
- Library Pin Properties
- Library Pin Properties for Power/Ground Objects
- Library Timing Arc Properties
- Net Properties
- Net Properties for Power/Ground Objects
- Path Group Properties
- Pin Properties
- Pin Properties for Power/Ground Objects
- Port Properties
- Timing Arc Properties
- Timing Path Properties
- Timing Point Properties
- si_victim Properties
- si_attacker Properties
- User-Defined Properties

The `get_property` command supports the `report_precision` global variable settings.

The `get_property` command supports DRV constraints (`set_min_fanout`, `set_max_fanout`, `set_min_transition`, `set_max_transition`, `set_min_capacitance`, and `set_max_capacitance`) applied on library pins.

The `get_property` command does not work with partial property names. You are now required to specify the full name of the property.

Parameters

`-help`	Prints out the command usage.
`-clock` *clock_name*	Specifies the clock for which to query certain object properties.
property	Specifies the property for which to retrieve the attribute value.
`-quiet`	Suppresses all error and warning messages generated when the `get_property` command is run.
var_name	Specifies a pointer to a collection containing the object. **Note:** If the collection contains more than one object, the `get_property` command returns the property values for each object in the specified collection.
`-view` *view_name*	Specifies the analysis view in which to query the object attribute. You can query properties only for the following objects in an analysis view: library cells, library pins, ports, cells, pins, timing arcs, and nets. You can specify this parameter only when the software is in multi-mode multi-corner timing analysis mode. **Note**: The properties (described in the tables below), which are related to slack, delay, arrival, slew, transition, capacitance, uncertainty and latency, depend on the specified view. When the `-view` parameter is not specified, the maximum (or minimum) value for all the views is returned.

Cell Properties

`area`	Returns the area of the cell. If the cell is hierarchical, also includes the net area. *Return type:* float
`cell_footprint`	Returns the clock gating integrated cells present in a library. When specified, the software returns a value that is used to determine the integrated cell functionality to be used by clock gating tools. For example, `get_property [get_lib_cells 1.08_CTS_HT.db/CTB_F18_HT] cell_footprint` *Return Type*: String
`clock_gating_integrated_cell`	Returns the clock gating integrated cells present in a library cell. For example, `get_property [get_lib_cells CTS_HT.db/ICG_F4_HVT] clock_gating_integrated_cell` *Return Type*: String
`clock_gating_integrated_cell`	Returns the string specified for the clock_gating_integrated_cell attribute in the library for the corresponding cell. *Return Type*: Float For example, `get_property [get_cells <cell name>] clock_gating_integrated_cell`
`early_cell_check_derate_factor`	Returns the derating factor for early paths specified through the `set_timing_derate` command with the `-early` parameter. *Return type:* float
`early_cell_check_mean_derate_factor`	Returns the derating factor for early paths on the instance – when the `set_timing_derate -mean` parameter is specified. *Return type:* float
`early_clock_check_incremental_derate_factor`	Returns the early clock path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter. *Return type:* float

`early_data_check_incremental_derate_factor`	Returns the early data path instance's incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter. *Return type:* float
`early_cell_check_sigma_derate_factor`	Returns the derating factor for early paths on the instance - when the `set_timing_derate -sigma` parameter is specified. *Return type:* float
`early_clk_cell_derate_factor`	Returns the derating factor for early clock paths specified through the `set_timing_derate` command with the `-early` parameter. *Return type:* float
`early_clk_cell_mean_derate_factor`	Returns the derating factor for early clock paths – when the `set_timing_derate -mean` parameter is specified. *Return type:* float
`early_clk_cell_sigma_derate_factor`	Returns the derating factor for early clock paths – when the `set_timing_derate -sigma` parameter is specified. *Return type:* float
`early_data_cell_derate_factor`	Returns the derating factor for early paths specified through the `set_timing_derate` command with the `-early` parameter. *Return type:* float
`early_data_cell_mean_derate_factor`	Returns the derating factor for early paths – when the `set_timing_derate -mean` parameter is specified. *Return type:* float
`early_data_cell_sigma_derate_factor`	Returns the derating factor for early paths – when the `set_timing_derate -sigma` parameter is specified. *Return type:* float
`early_fall_cell_check_derate_factor`	Returns the early cell check derating factor specified through the `set_timing_derate` command with the `-fall` parameter. *Return type:* float
`early_fall_cell_check_mean_derate_factor`	Returns the early cell check derating factor – when the `set_timing_derate -cell_check` and -mean parameters are specified. *Return type:* float
`early_fall_cell_check_sigma_derate_factor`	Returns the early cell check derating factor – when the `set_timing_derate -cell_check` and `-sigma` parameters are specified. *Return type:* float
`early_fall_clk_cell_derate_factor`	Returns the early clock path derating factor specified through the `set_timing_derate` command with the `-fall` parameter. *Return type:* float
`early_fall_clk_cell_mean_derate_factor`	Returns the early clock path derating factor – when the `set_timing_derate -fall` and `-mean` parameters are specified. *Return type:* float
`early_fall_clk_cell_sigma_derate_factor`	Returns the early clock path derating factor – when the `set_timing_derate -fall` and `-sigma` parameters are specified. *Return type:* float
`early_fall_clock_incremental_derate_factor`	Returns the early clock path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-fall` parameter is specified. *Return type*: float

`early_fall_data_cell_derate_factor`	Returns the early data cell check derating factor – when the `set_timing_derate -fall` parameter is specified. *Return type:* float
`early_fall_data_cell_mean_derate_factor`	Returns the early data cell check derating factor – when the `set_timing_derate -fall` and `-mean` parameters are specified. *Return type:* float
`early_fall_data_cell_sigma_derate_factor`	Returns the early data cell check derating factor – when the `set_timing_derate -fall` and `-sigma` parameters are specified. *Return type:* float
`early_fall_data_incremental_derate_factor`	Returns the early data path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-fall` parameter is specified. *Return type*: float
`early_rise_cell_check_derate_factor`	Returns the early cell check derating factor specified through the `set_timing_derate` command with the `-rise` and `-cell_check` parameter. *Return type:* float
`early_rise_cell_check_mean_derate_factor`	Returns the early cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float
`early_rise_cell_check_sigma_derate_factor`	Returns the early cell check derating factor – when the `set_timing_derate -rise` and `-sigma` parameters are specified. *Return type:* float
`early_rise_clk_cell_derate_factor`	Returns the early clock cell check derating factor specified through the `set_timing_derate` command with the `-rise` parameter. *Return type:* float
`early_rise_clk_cell_mean_derate_factor`	Returns the early clock cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float
`early_rise_clk_cell_sigma_derate_factor`	Returns the early clock cell check derating factor – when the `set_timing_derate -rise` and `-sigma` parameters are specified. *Return type:* float
`early_rise_clock_incremental_derate_factor`	Returns the early clock path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return type*: float
`early_rise_data_cell_derate_factor`	Returns the early data cell check derating factor specified through the `set_timing_derate` command with the `-rise` parameter. *Return type:* float
`early_rise_data_cell_mean_derate_factor`	Returns the early data cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float
`early_rise_data_cell_sigma_derate_factor`	Returns the early data cell check derating factor – when the `set_timing_derate -rise` and `-sigma` parameters are specified. *Return type:* float
`early_rise_data_incremental_derate_factor`	Returns the early data path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return type*: float

`has_sdc_assertions`	Returns a value of `true`, if the specified cell has SDC assertions applied on it. For example, `get_property [get_cells <cell name>] has_sdc_assertions` *Return Type*: Boolean
`hierarchical_level`	Returns the hierarchical level of the specified cell. For example, `get_property [get_cell -hierarchical *] hierarchical_level` *Return Type*: Integer
`hierarchical_name`	Returns the complete hierarchical name of the cell. *Return type:* string
`instance_model`	Reports the model type of an instance. The Instance model type can be ecsmn, ccsn, cdb, udn, or nldm. In case a noise model does not exist, the software returns 'NA'. For example, `get_property [get_cells inst1/buf22 ] instance_model` *Return type:* string
`is_black_box`	Returns a value of `true` if the cell is a black box cell. A cell is considered as a black box if the "function" definition of the cell is missing from the library. *Return type:* boolean
`is_buffer`	Returns a value of `true` if the associated library cell is recognized as a buffer cell. For example, `get_property [get_cells mmu/IB1] is_buffer` *Return type:* boolean
`is_clock_gating_check`	Returns a value of true if the cell is gated. *Return type:* boolean
`is_combinational`	Returns a value of `true` if the cell is a combinational cell (not a sequential cell). *Return type:* boolean
`is_disable_timing`	Returns a value of `true` if the cell's timing has been disabled using the `set_disable_timing` command. *Return type:* boolean
`is_dont_touch`	Returns a value of `true` if the cell definition includes `dont_touch:true`. *Return type:* boolean
`is_fall_edge_triggered`	Returns a value of `true` if the cell is triggered by the falling edge of the clock. *Return type:* boolean
`is_hierarchical`	Returns a value of `false` if the cell is a leaf or library cell. *Return type:* boolean
`is_integrated_clock_gating_cell`	Returns a value of `true` if the cell is an integrated clock gating cell. *Return type:* boolean
`is_interface_timing`	Returns a value of true if a library cell has interface timing specified for that cell. *Return Type*: boolean

`is_unmapped`	Returns a value of true if the specified cell name does not have a defined library cell. For example, `get_property [get_cells <cell name>] is_unmapped` *Return Type*: Boolean
`is_memory_cell`	Returns a value of `true` if the cell is a memory cell. *Return type:* boolean
`is_negative_level_sensitive`	Returns a value of `true` if the cell is used as a negative level-sensitive sequential element, such as a negative level-sensitive latch. *Return type:* boolean
`is_pad_cell`	Returns a value of `true` if the Liberty library `is_pad_cell` attribute is set to `true` for this pad cell. *Return type:* boolean
`is_positive_level_sensitive`	Returns a value of `true` if the cell is used as a positive level-sensitive sequential element, such as a positive level-sensitive latch. *Return type:* boolean
`is_rise_edge_triggered`	Returns a value of `true` if the cell is triggered by the rising edge of the clock. *Return type:* boolean
`is_sequential`	Returns a value of `true` if the cell is a latch or flip-flop, or if the cell has sequential timing checks. *Return type:* boolean
`is_tristate`	Returns a value of `true` if the cell definition includes `three_state:true`. *Return type:* boolean
`late_cell_check_derate_factor`	Returns the derating factor for late paths specified through the `set_timing_derate` command with the `-late` parameter. *Return type:* float
`late_cell_check_mean_derate_factor`	Returns the derating factor for late paths – when the `set_timing_derate -late` and `-mean` parameters are specified. *Return type:* float
`late_cell_check_sigma_derate_factor`	Returns the derating factor for late paths – when the `set_timing_derate -late` and `-sigma` parameters are specified. *Return type:* float
`late_clk_cell_derate_factor`	Returns the derating factor for late clock paths specified through the `set_timing_derate` command with the `-late` parameter. *Return type:* float
`late_clk_cell_mean_derate_factor`	Returns the derating factor for late clock paths – when the `set_timing_derate -late` and `-mean` parameters are specified. *Return type:* float
`late_clk_cell_sigma_derate_factor`	Returns the derating factor for late clock paths – when the `set_timing_derate -late` and `-sigma` parameters are specified. *Return type:* float
`late_clock_check_incremental_derate_factor`	Returns the late clock path instance's incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter. *Return type*: float
`late_data_cell_derate_factor`	Returns the derating factor for late data paths specified through the `set_timing_derate` command with the `-late` parameter. *Return type:* float

late_data_cell_mean_derate_factor	Returns the derating factor for late data paths – when the set_timing_derate -late and -mean parameters are specified. For example, get_property [get_cells <cell name>] late_data_cell_mean_derate_factor *Return Type*: Float
late_data_cell_sigma_derate_factor	Returns the derating factor for late data paths – when the set_timing_derate -late and -sigma parameters are specified. *Return type:* float
late_data_check_incremental_derate_factor	Returns the late data path instances' incremental derating factor specified through the set_timing_derate -incremental_adjust parameter. *Return type*: float
late_fall_cell_check_derate_factor	Returns the late cell check derating factor specified through the set_timing_derate command with the -fall parameter. *Return type:* float
late_fall_cell_check_mean_derate_factor	Returns the late cell check derating factor – when the set_timing_derate -fall and -mean parameters are specified. *Return type:* float
late_fall_cell_check_sigma_derate_factor	Returns the late cell check derating factor – when the set_timing_derate -fall and -sigma parameters are specified. *Return type:* float
late_fall_clk_cell_derate_factor	Returns the late clock cell check derating factor specified through the set_timing_derate command with the -fall parameter. *Return type:* float
late_fall_clk_cell_mean_derate_factor	Returns the late clock cell check derating factor – when the set_timing_derate -fall and -mean parameters are specified. *Return type:* float
late_fall_clk_cell_sigma_derate_factor	Returns the late clock cell check derating factor – when the set_timing_derate -fall and -sigma parameters are specified. *Return type:* float
late_fall_clock_incremental_derate_factor	Returns the late clock path instances' incremental derating factor specified through the set_timing_derate -incremental_adjust parameter - when the -fall parameter is specified. *Return type*: float
late_fall_data_cell_derate_factor	Returns the late data cell check derating factor specified through the set_timing_derate command with the -fall parameter. *Return type:* float
late_fall_data_cell_mean_derate_factor	Returns the late data cell check derating factor – when the set_timing_derate -fall and -mean parameters are specified. *Return type:* float
late_fall_data_cell_sigma_derate_factor	Returns the late data cell check derating factor – when the set_timing_derate -fall and -sigma parameters are specified. *Return type:* float
late_fall_data_incremental_derate_factor	Returns the late data path instances' incremental derating factor specified through the set_timing_derate -incremental_adjust parameter - when the -fall parameter is specified. Return type: float

`late_rise_cell_check_derate_factor`	Returns the late cell check derating factor specified through the `set_timing_derate` command with the `-rise` parameter. *Return type:* float
`late_rise_cell_check_mean_derate_factor`	Returns the late cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float
`late_rise_cell_check_sigma_derate_factor`	Returns the late cell check derating factor – when the `set_timing_derate -fall` and `-sigma` parameters are specified. *Return type:* float
`late_rise_clk_cell_derate_factor`	Returns the late clock cell check derating factor specified through the `set_timing_derate` command with the `-rise` parameter. *Return type:* float
`late_rise_clk_cell_mean_derate_factor`	Returns the late clock cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float
`late_rise_clk_cell_sigma_derate_factor`	Returns the late clock cell check derating factor – when the `set_timing_derate -fall` and `-sigma` parameters are specified. *Return type:* float
`late_rise_clock_incremental_derate_factor`	Returns the late clock path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return type*: float
`late_rise_data_cell_derate_factor`	Returns the late data cell check derating factor specified through the `set_timing_derate` command with the `-rise` parameter. *Return type:* float
`late_rise_data_cell_mean_derate_factor`	Returns the late data cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float
`late_rise_data_cell_sigma_derate_factor`	Returns the late data cell check derating factor – when the `set_timing_derate -rise` and `-sigma` parameters are specified. *Return type:* float
`late_rise_data_incremental_derate_factor`	Returns the late data path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return type*: float
`lib_cell`	Returns a collection of all the library cell objects associated with the specified library pins/cells. For example, `get_property [get_cells AAA] lib_cell -view VIEW1` *Return type*: collection
`name`	Returns the leaf-level name of the cell. *Return type:* string
`object_type`	Returns the object type `cell`. *Return type:* string
`pin_count`	Returns the total number of signal pins. *Return type:* integer

`ref_lib_cell_name`	Returns the name of reference module of the given cell. The reference module of the cell can be a Verilog module or a leaf library cell. *Return type:* string
`threshold_voltage_group`	Returns name of a group/category – that is specified based on the cell's threshold voltage (high or low) characteristics. For example, `get_property [get_lib_cells AND2_X1] threshold_voltage_group` *Return type:* string
`timing_model_type`	Returns the model type for a given cell or instance. The supported values are `abstracted`, `extracted`, and `qtm`. *Return type:* string
`x_coordinate_max`	Returns the maximum x coordinate of the cell. *Return type:* float
`x_coordinate_min`	Returns the minimum x coordinate of the cell. *Return type:* float
`y_coordinate_max`	Returns the maximum y coordinate of the cell. *Return type:* float
`y_coordinate_min`	Returns the minimum y coordinate of the cell. *Return type:* float

Cell Properties for Power/Ground Objects	
`is_always_on`	Returns a value of `true` if a cell instance is an always-on cell. *Return type*: boolean For example, `get_property [get_cells mmu/U1] is_always_on`
`is_inverter`	Returns a value of `true` if a cell instance is an inverter cell. *Return type*: boolean For example, `get_property [get_cells mmu/INV1] is_inverter`
`is_isolation_cell`	Returns a value of `true` if a cell instance is an isolation cell. *Return type*: boolean For example, `get_property [get_cells mmu/U1] is_isolation_cell`
`is_level_shifter`	Returns a value of `true` if a cell instance is a level-shifter cell. *Return type*: boolean For example, `get_property [get_cells mmu/U1] is_level_shifter`
`is_power_switch`	Returns a value of `true` if a cell instance is a power switch cell. Return type: boolean For example, `get_property [get_cells mmu/U1] is_power_switch`
`is_retention`	Returns a value of `true` if a cell instance is a retention cell. *Return type*: boolean For example, `get_property [get_cells mmu/U1] is_retention`
`level_shifter_type`	Returns the type of level-shifter (e.g., LH, HL, or HL_LH) that a cell instance is. *Return type*: string For example, `get_property [get_cells mmu/U1] level_shifter_type`

`pg_pins`	Returns a collection of the PG pins that are present in a cell instance. *Return type*: collection For example, `get_property [get_cells mmu/U1] pg_pins`
`power_switch_type`	Returns the type of power switch (e.g., coarse-grain, fine-grain) that a cell instance is. *Return type*: string For example, `get_property [get_cells mmu/U1] power_switch_type`
`std_cell_main_rail_name`	Returns the name of the main power rail driving the power pins of a cell instance that is the `pg_pin`, which has the `std_cell_main_rail` library attribute set as `true` for the instance cell. *Return type*: string For example, `get_property [get_cells mmu/U1] std_cell_main_rail_name`

Clock Properties

`child_clocks`	Returns the first level of generated clocks. This property also works for nested generated clocks. *Return type*: collection
`comment`	Returns the comment set for the specified clock. *Return Type*: String For example, `get_property [get_clocks CK] comment`
`clock_network_pins`	Returns a collection of all pins on the clock network for the clock. *Return type:* collection
`delay_max_fall`	Returns the maximum falling delay value for the clock. *Return type:* float
`delay_max_rise`	Returns the maximum rising delay value for the clock. *Return type:* float
`delay_min_fall`	Returns the minimum falling delay value for the clock. *Return type:* float
`delay_min_rise`	Returns the minimum rising delay value for the clock. *Return type:* float
`divide_by`	Returns dfactor set for the specified clock. For example, `get_property [get_clocks ck] divide_by` *Return Type*: Integer
`driving_network_pins`	Returns a collection of the network pins of the driving clock. For example, `get_property [get_clocks clk] driving_network_pins` *Return Type*: Collection
`duty_cycle`	Returns the duty cycle for the specified clock. For example, `get_property [get_clocks CLK] duty_cycle` *Return Type*: Float

`edges`	Return the edges that are set for a specified clock. For example, `get_property [get_clocks ck] edges` *Return Type*: String
`edge_shift`	Return the edge shift that is set for a specified clock. For example, `get_property [get_clocks ck] edge_shift` Return Type: String
`generated_clocks_extended`	Returns generated clocks derived from the regular clock. *Return type:* collection
`hierarchical_name`	Returns the complete hierarchical name of the clock. *Return type:* string
`hold_uncertainty`	Returns the most conservative uncertainty of all the possible uncertainty assertions associated with a pin, when the `set_clock_uncertainty -hold` parameter is specified. For example, `get_property [get_clocks <clock name>] hold_uncertainty` *Return Type*: Float
`is_context_mapped`	Returns a value of `true` if a clock is mapped to the top in a context. Additionally, this is also reported with the `report_clocks` command. For example, `get_property [get_clocks <clock name>] is_context_mapped` *Return Type*: Boolean
`ideal_transition_max_fall`	Returns the ideal clock transition asserted on clock waveforms specified with the `set_clock_transition` command using the `-fall` and `-max` parameters. *Return type:* float
`ideal_transition_max_rise`	Returns the ideal clock transition asserted on clock waveforms specified with the `set_clock_transition` command using the `-rise` and `-max` parameters. *Return type:* float
`ideal_transition_min_fall`	Returns the ideal clock transition asserted on clock waveforms specified with `set_clock_transition` command using the `-fall` and `-min` parameters. *Return type:* float
`ideal_transition_min_rise`	Returns the ideal clock transition asserted on clock waveforms specified with `set_clock_transition` command using the `-rise` and `-min` parameters. *Return type:* float
`is_active`	Returns a value of `true` if the clock specified is active in the current view. *Return type:* boolean
`is_generated`	Returns a value of `true` if the clock is a generated clock. *Return type:* boolean
`is_inverted`	Returns a value of `true`, if a specified clock is inverted. For example, `get_property [get_clocks ck] is_inverted` Return Type: Boolean

`is_source_inverted`	Returns a value of `true` if a specified clock source is inverted. For example, `get_property [get_clocks clk] is_source_inverted` *Return Type*: Boolean
`is_propagated_clock`	Returns a value of `true` if the clock is in propagated mode. *Return type:* boolean
`is_virtual`	Returns a value of `true` if the specified clock is virtual. For example, `get_property [get_clocks v_clk] is_virtual` `Return Type`: Boolean
`latency_fall_max`	Returns the maximum fall latency for a clock, when the `set_clock_latency -max -fall` parameters are specified. *Return type:* float
`latency_fall_min`	Returns the minimum fall latency for a clock, when the `set_clock_latency -min -fall` parameters are specified. *Return type:* float
`latency_rise_max`	Returns the maximum rise latency for a clock, when the `set_clock_latency -max -rise` parameters are specified. For example, `get_property [get_clocks <clock name>] latency_rise_max` *Return Type*: Float
`latency_rise_min`	Returns the minimum rise latency for a clock, when the `set_clock_latency -min -rise` parameters are specified. For example, `get_property [get_clocks <clock name>] latency_rise_min` *Return Type*: Float
`lead_edge_type`	Returns an edge type (rise or fall) corresponding to the leading edge for a specified clock. For example, `get_property [get_clocks <clock name>] lead_edge_type` *Return Type*: String
`master_clock`	Returns a collection of the master clocks for a specified clock. For example, `get_property [get_clocks clk] master_clock` *Return Type*: Collection
`master_source`	Returns a collection of the master sources for a specified clock. For example, `get_property [get_clocks ck] master_source` *Return Type*: Collection
`max_capacitance_clock_path_fall`	Returns fall max_capacitance value on clock paths. *Return type:* float
`max_capacitance_clock_path_rise`	Returns rise max_capacitance value on clock paths. *Return type:* float
`max_capacitance_data_path_fall`	Returns fall max_capacitance value on data paths. *Return type:* float
`max_capacitance_data_path_rise`	Returns rise max_capacitance value on data paths. *Return type:* float
`max_transition_clock_path_fall`	Returns fall max_transition value on clock paths. *Return type:* float

`max_transition_clock_path_rise`	Returns rise max_transition value on clock paths. *Return type:* float
`max_transition_data_path_fall`	Returns fall max_transition value on data paths. *Return type:* float
`max_transition_data_path_rise`	Returns rise max_transition value on data paths. *Return type:* float
`min_pulse_width_high`	Returns the minimum pulse width for high signals for the specified clock, when the `set_min_pulse_width -high` parameter is specified. For example, `get_property [get_clocks <clock name>] min_pulse_width_high` *Return Type*: Float
`min_pulse_width_low`	Returns the minimum pulse width for low signals for the specified clock, when the `set_min_pulse_width -low` parameter is specified. For example, `get_property [get_clocks <clock name>] min_pulse_width_low` *Return Type*: Float
`multiply_by`	Returns mfactor set for the specified clock. For example, `get_property [get_clocks clk] multiply_by` *Return Type*: Integer
`name`	Returns the name of the clock. *Return type:* string
`object_type`	Returns the object type `clock`. *Return type:* string
`period`	Returns the clock period. *Return type:* float
`setup_uncertainty`	Returns the most conservative uncertainty of all the possible uncertainty assertions associated with pins, when the `set_clock_uncertainty -setup` parameter is specified for a clock. For example, `get_property [get_clocks <clock name>]setup_uncertainty` *Return Type*: Float
`source_latency_early_fall_max`	Returns the early source latency for the falling transition at the maximum corner, when the `set_clock_latency -source -early -fall -max` parameters are specified for the clock. For example, `get_property [get_clocks <clock name>] source_latency_early_fall_max` *Return Type*: float
`source_latency_early_fall_min`	Returns the early source latency for the falling transition at the min corner, when the `set_clock_latency -source -early -fall -min` parameters are specified for the clock. For example, `get_property [get_clocks <clock name>] source_latency_early_fall_min` *Return type:* float
`source_latency_early_rise_max`	Returns the early source latency for the rising transition at the max corner, when the `set_clock_latency -source -early -rise -max` parameters are specified for the clock. For example, `get_property [get_clocks <clock name>] source_latency_early_rise_max` *Return Type*: float

`source_latency_early_rise_min`	Returns the early source latency for the falling transition at the min corner, when the `set_clock_latency -source -early -rise -min` parameters are specified for the clock. For example, `get_property [get_clocks <clock name>] source_latency_early_rise_min` *Return type:* float
`source_latency_late_fall_max`	Returns the late source latency for the falling transition at the max corner, when the `set_clock_latency -source -late -fall -max` parameters are specified for the clock. For example, `get_property [get_clocks <clock name>] source_latency_late_fall_max` *Return type:* float
`source_latency_late_fall_min`	Returns the late source latency for the falling transition at the min corner, when the `set_clock_latency -source -late -fall -min` parameters are specified for the clock. For example, `get_property [get_clocks <clock name>] source_latency_late_fall_min` *Return type:* float
`source_latency_late_rise_max`	Returns the late source latency for the rising transition at the max corner, when the `set_clock_latency -source -late -rise -max` parameters are specified for the clock. For example, `get_property [get_clocks <clock name>] source_latency_late_rise_max` *Return type:* float
`source_latency_late_rise_min`	Returns the late source latency for the rising transition at the min corner, when the `set_clock_latency -source -late -rise -min` parameters are specified for the clock. For example, `get_property [get_clocks <clock name>] source_latency_late_rise_min` *Return type:* float
`sources`	Returns a collection of the clock's source pins or ports. *Return type:* collection
`view_name`	In multi-mode multi-corner mode, returns the analysis view name associated with a given clock. *Return type*: string
`waveform`	Returns the rising and falling edge times of the waveform. *Return type:* string

Design Properties

`analysis_type`	Returns the analysis mode: `single`, `bc_wc`, or `on_chip_variation`. *Return type:* string
`capacitance_unit_in_farad`	Returns the capacitance unit specified in the library. *Return type:* float
`chip_size`	Returns the chip size. The chip size can be specified with the `aocv_chip_size` global variable. If this variable is not set, then the software will calculate the chip size from the design node locations. The global variable setting takes precedence over the software setting. *Return type:* float

`current_unit_in_amp`	Returns the current unit specified in the library. *Return type:* float
`hierarchical_name`	Returns the complete hierarchical name of the design. *Return type:* string
`is_dont_touch`	Returns `true` if the design is specified through the `set_dont_touch` command. *Return type:* boolean
`is_max_transition_asserted`	Returns a value of `true` if a maximum transition value (set using the `set_max_transition` command) is defined in the design. *Return type:* boolean
`is_min_transition_asserted`	Returns a value of `true` if a minimum transition value (set using the `set_min_transition` command) is defined in the design. *Return type:* boolean
`max_capacitance`	Returns the maximum capacitance value for the design. *Return type:* float
`max_fanout`	Returns the maximum fanout value for the design. *Return type:* float
`max_transition`	Returns the maximum transition design rule limit for the design. *Return type:* float
`min_capacitance`	Returns the minimum capacitance value for the design. *Return type:* float
`object_type`	Returns the object type `design`. *Return type: string*
`operating_condition_max`	Returns the name of the maximum operating condition specified for the design. *Return type:* string
`operating_condition_min`	Returns the name of the minimum operating condition specified for the design. *Return type:* string
`process_max`	Returns the process value of the maximum operating condition specified for the design. *Return type:* float
`process_min`	Returns the process value of the minimum operating condition specified for the design. *Return type:* float
`resistance_unit_in_ohm`	Returns the resistance value from the library. *Return type:* float
`slew_threshold_percent_fall_high`	Returns the upper slew trip point for falling waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_fall_low`	Returns the lower slew trip point for falling waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_rise_high`	Returns the upper slew trip point for rising waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_rise_low`	Returns the lower slew trip point for rising waveforms, specified as a percent. *Return type:* float
`temperature_max`	Returns the temperature value of the maximum operating condition for the design. *Return type:* float

`temperature_min`	Returns the temperature value of the minimum operating condition for the design. *Return type:* float
`time_unit_in_second`	Returns the time units of the design, in seconds. that is, time unit of the design is 1.000000ns, the property returns 1.000000e-09. *Return type:* float
`tree_type_max`	Returns the value of the `tree_type` attribute for the specified maximum operating condition. *Return type:* string
`tree_type_min`	Returns the value of the `tree_type` attribute for the specified minimum operating condition. *Return type:* string
`voltage_max`	Returns the voltage value of the maximum operating condition for the design. *Return type:* float
`voltage_min`	Returns the voltage value of the minimum operating condition for the design. *Return type:* float
`voltage_unit_in_volt`	Returns the voltage units specified in the library for the design. *Return type:* float

Library Properties

`default_max_transition`	Returns the default maximum transition time limit specified for a given library. *Return type:* float
`default_operating_conditions`	Returns the default operating conditions specified for a given library. For example, `get_property [get_libs FreePDK45_lib_v1.0] default_operating_conditions` *Return type*: string
`hierarchical_name`	Returns the hierarchical path name for the library. *Return type:* string
`input_threshold_pct_fall`	Returns the value of threshold point on an input pin signal falling from 1 to 0, which is used in modelling the delay of a input pin to an output pin. *Return type:* integer
`input_threshold_pct_rise`	Returns the value of threshold point on an input pin signal rising from 0 to 1, which is used in modelling the delay of a input pin to an output pin. *Return type:* integer
`lib_file_path`	Reports full on-disk path of a library. In case of a library database (LDB) file, the property will return the full on-disk path which LDB was compiled. *Return type:* string
`lib_version`	Returns the software version in which the library file (LDB) was generated. *Return type:* integer
`nominal_process`	Returns a value of the process either modeled as nominal process or as the process in default operating condition in th For example, `get_property [get_libs sc_cmoslp] nominal_process` *Return Type:* float

`nominal_temperature`	Returns a value of the temperature either modeled as nominal temperature or as the temperature in default operating c For example, `get_property [get_libs sc_cmoslp] nominal_temperature` *Return Type:* float
`nominal_voltage`	Returns a value of the voltage either modeled as nominal voltage or as the voltage in default operating condition in the For example, `get_property [get_libs sc_cmoslp] nominal_voltage` *Return Type:* float
`object_type`	Returns the object type `library`. *Return type:* string
`output_threshold_pct_fall`	Returns the value of threshold point on an output signal falling from 1 to 0, which is used in modelling the delay of a sig pin to an output pin. *Return type:* integer
`output_threshold_pct_rise`	Returns the value of threshold point on an output signal rising from 0 to 1, which is used in the modelling of a signal tra an output pin. *Return type:* integer
`slew_derate_from_library`	Specifies how the transition times found in the library need to be derated to match the transition times between the cha *Return type:* float
`slew_lower_threshold_pct_fall`	Returns the value of lower threshold point used in modeling the delay of a pin falling from 1 to 0. *Return type:* float
`slew_lower_threshold_pct_rise`	Returns the value of lower threshold point used to model the delay of a pin rising from 0 to 1. *Return type:* float
`slew_upper_threshold_pct_fall`	Returns the value of upper threshold point used to model the delay of a pin falling from 1 to 0. *Return type:* float
`slew_upper_threshold_pct_rise`	Returns the value of upper threshold point used to model the delay of a pin rising from 0 to 1. *Return type:* float
`source_file_name`	Returns the full path of all library files that contain the specified library name. The use model is given below: `get_property [get_libs libname] source_file_name [-view viewName]` If the `-view` parameter is specified, the property returns the path of the library files in the given analysis view. If this parameter is not specified, the command returns the path of all library files in all the analysis views. *Return Type:* string
Library Properties for Power/Ground Objects	

`power_rails`	Returns the name of the power rails along with their corresponding voltages as defined in the `voltage_map` attribute in
	Return Type: string
	For example,
	`get_property [get_libs sc_cmoslp] power_rails`
	`Output: Is a list of lists, each list showing the power rail name along with its associated voltage.`
	`{ {VDDG 1.045} {VDD 1.045} {VSS 0} }`

Library Cell Properties

`area`	Returns the area of the library cell. *Return Type:* float
`early_clock_check_incremental_derate_factor`	Returns the early clock path library cell check incremental derating factor specified through the `set_ti` *Return Type:* float
`early_data_check_incremental_derate_factor`	Returns the early data path library cell check incremental derating factor specified through the `set_tir` *Return Type*: float
`early_fall_clock_incremental_derate_factor`	Returns the early clock path library cell check incremental derating factor specified through the `set_ti` parameter is specified. *Return Type*: float
`early_fall_data_incremental_derate_factor`	Returns the early data path library cell check incremental derating factor specified through the `set_tir` parameter is specified. *Return Type*: float
`early_rise_clock_incremental_derate_factor`	Returns the early clock path library cell check incremental derating factor specified through the `set_ti` parameter is specified. *Return Type*: float
`early_rise_data_incremental_derate_factor`	Returns the early data path library cell check incremental derating factor specified through the `set_tir` parameter is specified. *Return Type*: float
`early_slew_derate_factor`	Returns the derate factor applied on a library cell when the `set_timing_derate -transition` paramete For example, `get_property [get_lib_cells CTS_HT.db/ICG_F4_HT] early_slew_derate_factor` *Return Type*: float
`fall_input_switching_derate_factor`	Returns the derate factor applied on a library cell when the `set_timing_derate -input_switching` par For example, `get_property [get_lib_cells PDK45_v1.0/IV_X32] fall_input_switching_derate_factor` *Return Type*: float
`has_ccs_noise`	Returns a value of `true` if a library cell has a CCS noise look-up table. For example, `get_property [get_lib_cells tst/tst_nm6] has_ccs_noise` *Return type:* boolean
`has_socv`	Returns a value of `true` if a library cell has a spatial derate table (SOCV). For example, `get_property [get_lib_cells PK4_lib_v1.0/A4_X2] has_socv` *Return type:* boolean
`has_spatial`	Returns a value of `true` if a spatial derate exists for a library cell. *Return type:* boolean
`hierarchical_name`	Returns the complete hierarchical name of the library cell (the library name followed by the library cell For example, `get_property [get_lib_cells -of [get_cell AB_IT/E_0146_tl]] hierarchical_name` *Return Type:* string
`is_black_box`	Returns a value of `true` if the cell is a black box cell. A cell is considered as a black box if the "function" definition of the cell is missing from the library. *Return type:* boolean

`is_buffer`	Returns a value of `true` if the associated library cell is recognized as a buffer cell. For example, `get_property [get_lib_cells -of [get_cell AB_IT/E_0146_tl]] is_buffer` *Return type:* boolean
`is_combinational`	Returns a value of `true` if the library cell is a combinational cell (not a sequential cell). *Return type:* boolean
`is_dont_touch`	Returns a value of `true` if the library cell definition includes `dont_touch:true`. *Return Type:* boolean
`is_dont_use`	Returns a value of `true` if the library cell description includes `dont_use:true`. *Return Type:* boolean
`is_fall_edge_triggered`	Returns a value of `true` if the library cell is triggered by the falling edge of the clock. *Return Type:* boolean
`is_instantiated`	Returns a value of `true` if library cells are instantiated in a design. For example, `get_property [get_lib_cells P4_lib_v1.0/N4_X2] is_instantiated` *Return type*: boolean
`is_interface_timing`	Returns a value of `true` if a library cell has interface timing specified for that cell. *Return type*: boolean
`is_level_shifter`	Returns a value of `true` if a cell instance is a level-shifter cell. *Return type*: boolean
`is_integrated_clock_gating_cell`	Returns a value of `true` if a cell is an integrated clock gating cell. For example, `get_property [get_lib_cells CTS_HT.db/ICG_F7_HT] is_integrated_clock_gating_cell` *Return type*: boolean
`is_inverter`	Returns a value of `true` if a cell instance is an inverter cell. For example, `get_property [get_lib_cells -of [get_cells inv]] is_inverter` *Return type*: boolean
`is_level_shifter`	Returns a value of `true` if a cell instance is a level-shifter cell. For example, `get_property [get_lib_cells -of [get_libs mk_1pv_125c]] is_level_shifter` *Return type*: boolean
`is_macro_cell`	Returns a value of `true` if a macro cell exists in a library. For example, `get_property [get_lib_cells L_mro2/mro2y] is_macro_cell` *Return type*: boolean

`is_memory_cell`	Returns a value of `true` if the cell is a memory cell.
	Return type: boolean
	Note: The library cells that have a memory group defined in the dotlib are considered as memory cells
	`cell ( ) {`
	`:`
	`memory() {`
	`type : ram ;`
	`address_width : 10 ;`
	`word_width : 7 ;`
	`}`
	`}`

`is_msv`	Returns a value of `true` if a cell is an MSV cell. For example, `get_property [get_lib_cells mk_1pv_125c/L8MTR] is_msv` *Return type*: boolean
`is_negative_level_sensitive`	Returns a value of `true` if the library cell is used as a negative level-sensitive latch. *Return type:* boolean
`is_pad_cell`	Returns a value of `true` if the Liberty library `is_pad_cell` attribute is set to `true` for this pad cell. *Return type:* boolean
`is_pll_cell`	Returns a value of `true` if the Liberty library `is_pll_cell` attribute is set to `true` for this library cell. *Return type:* boolean
`is_positive_level_sensitive`	Returns a value of `true` if the library cell is used as a positive level-sensitive latch. *Return type:* boolean
`is_rise_edge_triggered`	Returns a value of `true` if the library cell is triggered by the rising edge of the clock. *Return Type:* boolean
`is_sequential`	Returns a value of `true` if the library cell is a latch or flip-flop, or if the cell has sequential timing check *Return type:* boolean
`is_tristate`	Returns a value of `true` if the library cell definition includes `three_state:true`. *Return type:* boolean
`late_clock_check_incremental_derate_factor`	Returns the late clock path library cell check incremental derating factor specified through the `set_tim` *Return Type*: float
`late_data_check_incremental_derate_factor`	Returns the late data path library cell check incremental derating factor specified through the `set_tim` *Return Type*: float
`late_fall_clock_incremental_derate_factor`	Returns the late clock path library cell check incremental derating factor specified through the `set_tim` parameter is specified. *Return Type*: float
`late_fall_data_incremental_derate_factor`	Returns the late data path library cell check incremental derating factor specified through the `set_tim` parameter is specified. *Return Type*: float
`late_fall_clock_period_derate_factor`	Returns the derate factor for the clock period when the `set_timing_derate -late` and `-fall` paramete *Return type:* float

`late_fall_clock_period_mean_derate_factor`	Returns the late/fall derate factor for the clock period when the `set_timing_derate -mean` parameter is *Return type:* float
`late_fall_clock_period_sigma_derate_factor`	Returns the late/fall derate factor for the clock period when the `set_timing_derate -sigma` parameter i *Return type:* float
`late_fall_pulse_width_derate_factor`	Returns the late/fall derate factor for the pulse width when the `set_timing_derate` -late and -fall param *Return type:* float
`late_fall_pulse_width_mean_derate_factor`	Returns the late/fall derate factor for the pulse width when the `set_timing_derate` -mean parameter is *Return type:* float
`late_fall_pulse_width_sigma_derate_factor`	Returns the late/fall derate factor for the pulse width when the `set_timing_derate` -sigma parameter is *Return type:* float
`late_rise_clock_incremental_derate_factor`	Returns the late clock path library cell check incremental derating factor specified through the `set_tim` parameter is specified. *Return Type*: float
`late_rise_data_incremental_derate_factor`	Returns the late data path library cell check incremental derating factor specified through the `set_tim` parameter is specified. *Return Type*: float
`late_rise_clock_period_derate_factor`	Returns the derate factor for the clock period when the `set_timing_derate` -late and -rise parameters *Return type:* float
`late_rise_clock_period_mean_derate_factor`	Returns the late/rise derate factor for the clock period when the `set_timing_derate -mean` parameter is *Return type:* float
`late_rise_clock_period_sigma_derate_factor`	Returns the late/rise derate factor for the clock period when the `set_timing_derate -sigma` parameter *Return type:* float
`late_rise_pulse_width_derate_factor`	Returns the derate factor for the pulse width check when the `set_timing_derate -late` and `-rise` para *Return type:* float
`late_rise_pulse_width_mean_derate_factor`	Returns the late/rise derate factor for the pulse width when the `set_timing_derate -mean` parameter is *Return type:* float
`late_rise_pulse_width_sigma_derate_factor`	Returns the late/rise derate factor for the pulse width when the `set_timing_derate -sigma` parameter i *Return type:* float
`late_slew_derate_factor`	Returns the derate factor applied on a library cell, when the `set_timing_derate -transition` paramet For example, `get_property [get_lib_cells PK4_v1.0/IV_32] late_slew_derate_factor` *Return type:* float
`name`	Returns the leaf-level name of the library cell. *Return Type:* string
`object_type`	Returns the object type `lib_cell`. *Return Type:* string
`physical_variant_cells`	Returns the physical variant cells that are available in a library cell. For example, `get_property [get_lib_cells lca_md/SR1_md] physical_variant_cells` *Return Type:* string

`pin_count`	Returns the total number of signal pins. For example, `get_property [get_lib_cells PK45_v1.0/IN_X32] pin_count` *Return Type:* integer
`receiver_capacitance_type`	Returns the value of input capacitance group being used for delay calculations – C1C2 (2-piece mode *Return Type:* string
`retention_cell`	Returns the value of the retention_cell attribute specified in the liberty. *Return type*: string
`rise_input_switching_derate_factor`	Returns the derate factor applied on a library cell, when the `set_timing_derate -input_switching` par For example, `get_property [get_lib_cells PK45_v1.0/DL_X2] rise_input_switching_derate_factor` *Return type:* float
`signal_pins`	Returns the signal pins of a cell, along with the library name, library cell name, and pin name. For example, `get_property [get_lib_cells PK45_v1.0/IN_X32] signal_pins` *Return Type:* string
`threshold_voltage_group`	Returns the threshold voltage group assigned to a cell in a library. For example, `get_property [get_lib_cells L40_HT.db/CG_F8_HT] threshold_voltage_group` *Return Type:* string
`output_signal_level_high`	Returns the maximum voltage value of an output pin after a rising transition. For example, `get_property [get_lib_arcs -of [get_lib_cells px_ipid_3/px_ipid_3]] output_signal_level_h` *Return type:* float
`output_signal_level_low`	Returns the minimum voltage value of an output pin after a falling transition. For example, `get_property [get_lib_arcs -of [get_lib_cells px_ipid_3/px_ipid_3]] output_signal_level_l` *Return type:* float
`timing_model_type`	Returns the model type for a given cell or instance. The supported values are `abstracted`, `extracted`, *Return type*: string
Library Cell Properties for Power/Ground Objects	
`ground_pins`	Returns a collection of the ground pins of a library cell. *Return type*: collection For example, `get_property [get_lib_cells sc_cmoslp/AO22X] ground_pins`
`is_always_on`	Returns a value of `true` if the `always_on` attribute of a library cell is set to `true` indicating that the library *Return type*: boolean For example, `get_property [get_lib_cells sc_cmoslp/AON22_X4M] is_always_on`
`is_isolation_cell`	Returns a value of `true` if the library cell is an isolation cell. *Return type*: boolean For example, `get_property [get_lib_cells sc_cmoslp/ISO22_X4M] is_isolation_cell`
`is_power_switch`	Returns a value of `true` when the `switch_cell_type` attribute is defined for a library cell indicating tha *Return type*: boolean For example, `get_property [get_lib_cells sc_cmoslp/AO22X] is_power_switch`

`is_retention`	Returns a value of `true` when the `retention_cell` attribute is defined for a library cell indicating that th *Return type*: boolean For example, `get_property [get_lib_cells sc_cmoslp/RET22_X4M] is_retention`
`level_shifter_type`	Returns the type of level-shifter (e.g., LH, HL, or HL_LH) as defined by the `level_shifter_type` attribu *Return type*: string For example, `get_property [get_lib_cells sc_cmoslp/A2LVLD_X4M] level_shifter_type`
`lib_pg_pins`	Returns a collection of all PG pins (both power and ground) defined in the library of a library cell. *Return type*: collection For example, `get_property [get_lib_cells sc_cmoslp/AO22X] lib_pg_pins`
`power_pins`	Returns a collection of the power pins of a library cell. *Return type*: collection For example, `get_property [get_lib_cells sc_cmoslp/AO22X] power_pins`
`power_switch_type`	Returns the type of power-switch (e.g., coarse-grain, fine-grain) as defined by the `switch_cell_type` a *Return type*: string For example, `get_property [get_lib_cells sc_cmoslp/AO22X] power_switch_type`
`std_cell_main_rail_name`	Returns the name of a power rail that has the `std_cell_main_rail` library attribute defined as `true` for *Return type*: string For example, `get_property [get_lib_cells sc_cmoslp/AO22X] std_cell_main_rail_name`

Library Pin Properties

`capacitance`	Returns the capacitance for the library pin. *Return type:* float
`capacitance_max_fall`	Returns the maximum value of the falling capacitance range. *Return type:* float
`capacitance_max_rise`	Returns the maximum value of the rising capacitance range. *Return type:* float
`capacitance_min_fall`	Returns the minimum value of the falling capacitance range. *Return type:* float
`capacitance_min_rise`	Returns the minimum value of the rising capacitance range. *Return type:* float
`cell_name`	Returns the library cell name for the corresponding library pins. For example, `get_property [get_lib_pins PK4_lib_v1.0/AOI211_X2/B] cell_name` *Return type*: string
`direction`	Returns the direction of the library pin: `in`, `out`, or `inout`. *Return type:* string
`fanout_load`	Returns the fanout load value of the library pin. *Return type:* float

`function`	Returns the function for the corresponding library pins. For example, `get_property [get_lib_pins PK4_lib_v1.0/AND2_X1/ZN] function` *Return type*: string
`hierarchical_name`	Returns the hierarchical name of the library pin. *Return type:* string
`input_signal_level`	Returns the power rail name/signal that is defined for a library cell input pin. For example, `get_property [get_lib_pins PK4_lib_v1.0/BUF_X32/A] input_signal_level` *Return type*: string
`input_signal_level_high`	Returns the upper limit of partial voltage swing value that is defined for a library cell input pin. For example, `get_property [get_lib_pins rvt_ss_0p9v/LVLL/A] input_signal_level_high` *Return type*: float
`input_signal_level_low`	Returns the lower limit of partial voltage swing value that is defined for a library cell input pin. For example, `get_property [get_lib_pins rvt_ss_0p9v/LVLL/A] input_signal_level_low` *Return type*: float
`is_analog`	Returns a value of `true` if the library pin is an analog pin. For example, `get_property [get_lib_pins PK4_lib_v1.0/AOI222_X2/ZN] is_analog` *Return type*: boolean
`is_async`	Returns a value of `true` if the library pin is an asynchronous preset pin, or an asynchronous clear pin. *Return type:* boolean
`is_clear`	Returns a value of `true` if the pin is an asynchronous clear pin. *Return type:* boolean
`is_clock`	Returns a value of `true` if the library pin definition includes `clock:true`. *Return type:* boolean
`is_clock_gating_clock`	Returns a value of `true` if the library pin is defined as a clock pin of a clock gating cell. For example, `get_property [get_lib_pins P40_CTS_HVT.db/ICG_HVT/CLKIN] is_clock_gating_clock` *Return type*: boolean
`is_clock_gating_enable`	Returns a value of `true` if the library pin corresponds to the enable pin of a clock gating cell. For example, `get_property [get_lib_pins P40_CTS_HVT.db/ICG_HVT/CLKIN] is_clock_gating_enable` *Return type*: boolean
`is_data`	Returns a value of `true` if the library pin with defined sequential arcs is the data pin of a flip-flop. *Return type:* boolean
`is_fall_edge_triggered_clock`	Returns a value of `true` if the library pin is the clock pin of a falling edge triggered device. *Return type:* boolean
`is_fall_edge_triggered_data`	Returns a value of `true` if the library pin is the data pin of a falling edge triggered device. *Return type:* boolean

`is_negative_level_sensitive_clock`	Returns a value of `true` if the library pin is an enable pin of an active low level-sensitive device. *Return type:* boolean
`is_negative_level_sensitive_data`	Returns a value of `true` if the pin is a data pin of an active low level-sensitive device. *Return type:* boolean
`is_pad`	Returns a value of `true` if the library pin is a pad pin. For example, `get_property [get_lib_pins *] is_pad` *Return type*: boolean
`is_pll_feedback_pin`	Returns a value of `true` if the Liberty library `is_pll_feedback_pin` attribute is set to `true` for this library pin. *Return type:* boolean
`is_pll_output_pin`	Returns a value of `true` if the Liberty library `is_pll_output_pin` attribute is set to `true` for this library pin. *Return type:* boolean
`is_pll_reference_pin`	Returns a value of `true` if the Liberty library `is_pll_reference_pin` attribute is set to `true` for this library pin. *Return type:* boolean
`is_positive_level_sensitive_clock`	Returns a value of `true` if the library pin is an enable pin of an active high level-sensitive device. *Return type:* boolean
`is_positive_level_sensitive_data`	Returns a value of `true` if the pin is a data pin of an active high level-sensitive device. *Return type:* boolean
`is_preset`	Returns a value of `true` if the pin is a preset pin. *Return type:* boolean
`is_rise_edge_triggered_clock`	Returns a value of `true` if the library pin is the clock pin of a rising edge triggered device. *Return type:* boolean
`is_rise_edge_triggered_data`	Returns a value of `true` if the library pin is the data pin of a rising edge triggered device. *Return type:* boolean
`is_tristate`	Returns a value of `true` if the library pin definition includes `three_state:true`. *Return type:* boolean
`max_capacitance`	Returns the maximum capacitance limit for the library pin. *Return type:* float
`max_fanout`	Returns the maximum fanout value for the library pin. *Return type:* float
`max_transition`	Returns the maximum transition time limit specified for a given library pin. If the limit is not specified for a library pi *Return type:* float
`min_transition`	Returns the minimum transition time limit specified for a given library pin. If the limit is not specified for a library pir *Return type:* float
`min_capacitance`	Returns the minimum capacitance limit for the library pin. *Return type:* float
`min_fanout`	Returns the minimum fanout value for the library pin. *Return type:* float
`name`	Returns the leaf-level name of the library cell pin. *Return type:* string

`object_type`	Returns the object type; in this case, `lib_pin`. *Return type:* string
`related_ground_pin_name`	Returns related ground pin names for the corresponding library pins. *Return type:* string For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_ground_pin_name`
`related_power_pin_name`	Returns related power pin names for the corresponding library pins. *Return type:* string
`slew_threshold_percent_fall_high`	Returns the upper slew trip point for falling waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_fall_low`	Returns the lower slew trip point for falling waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_rise_high`	Returns the upper slew trip point for rising waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_rise_low`	Returns the lower slew trip point for rising waveforms, specified as a percent. *Return type:* float
Library Signal Pin Properties for Power/Ground Objects	
`input_signal_level_voltage`	Returns the voltage value corresponding to the power rail name/signal which is defined for the library-cell input pi with the relative power rail name through the `voltage_map` attribute defined in the library. *Return type:* float For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] input_signal_level_voltage`
`is_always_on`	Returns a value of `true` if the `always_on` attribute of a library signal pin is set to `true` indicating that the library cell *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_always_on`
`is_isolated`	Returns a value of `true` if the `is_isolated` attribute of a library signal pin is set to `true` indicating that the library ce *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_isolated`
`is_isolation_cell_data`	Returns a value of `true` if the `isolation_cell_data_pin` attribute of a library signal pin is set to `true` indicating tha *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_isolation_cell_data`
`is_isolation_cell_enable`	Returns a value of `true` if the `isolation_cell_enable_pin` attribute of a library signal pin is set to `true` indicating tl library cell. *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_isolation_cell_enable`
`is_level_shifter_data`	Returns a value of `true` if the `level_shifter_data_pin` attribute of a library signal pin is set to `true`, indicating that *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_level_shifter_data`

`is_level_shifter_enable`	Returns a value of `true` if the `level_shifter_enable_pin` attribute of a library signal pin is set to be `true` indicating cell. *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_isolation_cell_enable`
`is_power_switch_enable`	Returns a value of `true` if the `switch_cell_type` attribute of the corresponding library cell is defined and the `switc` *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_power_switch_enable`
`is_retention_cell_enable`	Returns a value of `true` if the `retention_pin` attribute of a signal pin is defined. *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_retention_cell_enable`
`output_signal_level`	Returns the power rail name/signal that is defined for a library cell output and inout pins. *Return type:* string For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] output_signal_level`
`output_signal_level_high`	Returns the upper/higher limit of partial voltage swing value that is defined for a library cell output and inout pins. *Return type:* float For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] output_signal_level_high`
`output_signal_level_low`	Returns the lower limit of partial voltage swing value that is defined for a library cell output and inout pins. *Return type:* float For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] output_signal_level_low`
`related_ground_pin`	Returns the related ground pins as a collection for the corresponding library cell pins. *Return type:* collection For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_ground_pin`
`related_ground_pin_name`	Returns the related ground pin names for the corresponding library cell pins. *Return type:* string For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_ground_pin_name`
`related_ground_pin_rail_voltage`	Returns the voltage value corresponding to the ground rail name defined for the `related_ground_pin` attribute of th associated with the relative ground rail name through the `voltage_map` attribute defined in the library. *Return type:* float For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_ground_pin_rail_voltage`
`related_power_pin`	Returns the related power pins as a collection for the corresponding library cell pins. *Return type:* collection For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_power_pin`
`related_power_pin_name`	Returns the related power pin names for the corresponding library cell pins. *Return type:* string For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_power_pin_name`

related_power_pin_rail_voltage	Returns the voltage value corresponding to the power rail name defined for the related_power_pin attribute of a li associated with the relative power rail name through the voltage_map attribute defined in the library. *Return type:* float For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_power_pin_rail_voltage`

Library Pin Properties for Power/Ground Objects

is_std_cell_main_rail	Returns a value of true if the library power pg_pin is the main rail of the library cell. It is determined by the std_cell_main_rail library attribute of libray pg_pin. *Return type*: boolean For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] is_std_cell_main_rail`
name	Returns the name of the library pg pin as defined in the library and associated with the pg_pin library attribute. *Return type*: string For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] name`
object_type	Returns lib_pg_pin as the object type for a library pg pin. *Return type*: string For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] object_type`

pg_type	Returns the type of the library pg pin as associated with the pg_type attribute of the corresponding library pg pin.
	Return type: string
	For example,
	`get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] pg_type`
	`get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X] -filter " name =~ *VDD*" ] pg_type`

rail_name	Returns the name of the rail to which the pg-pin is connected and is associated with the voltage_name attribute of the library pg-pin. *Return type*: string For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] rail_name`
rail_voltage	Returns the voltage from the voltage_map association of the rail to which the library pg-pin is connected. *Return type*: float For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] rail_voltage`
tied_to	Returns the libray pg pin which is connected to substrate-bias pg pin. *Return type*: string For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] tied_to`

Library Timing Arc Properties

`from_lib_pin`	Returns a collection of the source library pins of the library timing arc. *Return type:* collection
`is_disabled`	Return a value of `true` if a `set_disable_timing` constraint exists for a an arc. *Return type:* boolean
`object_type`	Returns the object type `lib_timing_arc`. *Return type:* string
`sdf_cond`	Returns the `sdf_cond` expression specified for the timing library arc in the library. *Return type:* string
`sense`	Returns the `timing_sense` specified for the timing library arc in the library. *Return type:* string
`to_lib_pin`	Returns a collection of the sink library pins of the library timing arc. *Return type:* collection
`timing_type`	Returns the type specified for the timing library arc in the library. *Return type:* string
`when`	Returns the `when` condition specified for the library timing arc in the library. *Return type:* string

Net Properties

`attackers`	Reports the parasitic data on a net - capacitance, resistance, or cross-coupling. *Return type:* collection
`capacitance_max`	Returns the total capacitance of the net for maximum conditions. *Return type:* float
`coupling_capacitance_max`	Returns the maximum value of coupling capacitance of a net over all the views. *Return type:* float
`capacitance_min`	Returns the total capacitance of the net for minimum conditions. *Return type:* float
`coupling_capacitance_min`	Returns the minimum value of coupling capacitance of a net over all the views. *Return type:* float
`driver_pins`	Returns a collection of the driver pins of the net. *Return type:* collection
`early_fall_clk_net_derate_factor`	Returns the early fall clock net derating factor specified through `set_timing_derate` command. *Return type:* float
`early_fall_clk_net_delta_derate_factor`	Returns the early fall clock delta delay net derating factor specified through the `set_timing_derate` command. *Return type:* float
`early_fall_data_net_delta_derate_factor`	Returns the early fall data delta net derating factor specified through the `set_timing_derate` command. *Return type:* float

early_fall_data_net_derate_factor	Returns the early fall data net derating factor specified through set_timing_derate command. *Return type:* float
early_rise_clk_net_delta_derate_factor	Returns the early rise clock delta net derating factor specified through the set_timing_derate command. *Return type:* float
early_rise_clk_net_derate_factor	Returns the early rise clock net derating factor specified through the set_timing_derate command. *Return type:* float
early_rise_data_net_delta_derate_factor	Returns the early rise data delta net derating factor specified through the set_timing_derate command. *Return type:* float
early_rise_data_net_derate_factor	Returns the early rise data net derating factor specified through the set_timing_derate command. *Return type:* float
has_detailed_parasitics	Returns a value of true if the net, or one of its parts, has detailed parasitics associated with it from either RC extraction or SPEF annotation. *Return type:* boolean
hierarchical_name	Returns the complete hierarchical name of the net. *Return type:* string
is_ideal	Returns a value of true if set_ideal_latency, set_ideal_transition, or set_ideal_network constraints exist for the net. *Return type*: Boolean
late_fall_clk_net_delta_derate_factor	Returns the late fall clock delta net derating factor specified through the set_timing_derate command. *Return type:* float
late_fall_clk_net_derate_factor	Returns the late fall clock net derating factor specified through the set_timing_derate command. *Return type:* float
late_fall_data_net_delta_derate_factor	Returns the late fall data delta net derating factor specified through the set_timing_derate command. *Return type:* float
late_fall_data_net_derate_factor	Returns the late fall data net derating factor specified through the set_timing_derate command. *Return type:* float
late_rise_clk_net_delta_derate_factor	Returns the late rise clock delta net derating factor specified through the set_timing_derate command. *Return type:* float
late_rise_clk_net_derate_factor	Returns the late rise clock net derating factor specified through the set_timing_derate command. *Return type:* float
late_rise_data_net_delta_derate_factor	Returns the late rise data delta net derating factor specified through the set_timing_derate command. *Return type:* float
late_rise_data_net_derate_factor	Returns the late rise data net derating factor specified through the set_timing_derate command. *Return type:* float
is_dont_touch	Returns a value of true if a set_dont_touch constraint exists for the net. *Return type:* boolean
load_pins	Returns a collection of the load pins of the net. *Return type:* collection
lumped_capacitance_max	Returns the maximum value of capacitance of a net based on the input library and parasitic model. *Return type:* float

`lumped_capacitance_min`	Returns the minimum value of capacitance of a net based on the input library and parasitic model. *Return type:* float
`name`	Returns the name of the net. *Return type:* string
`num_driver_pins`	Returns the number of driver pins on a net. *Return type*: integer
`num_load_pins`	Returns the number of load pins on the net. *Return type*: collection
`object_type`	Returns the object type `net`. *Return type:* string
`pin_capacitance_max`	Returns the sum of all pin capacitances of the net for maximum conditions. *Return type:* float
`pin_capacitance_max_fall`	Returns the sum of all pin capacitances of the net for the maximum value of the rising capacitance range. *Return type:* float
`pin_capacitance_max_rise`	Returns the sum of all pin capacitances of the net for the maximum value of the falling capacitance range. *Return type:* float
`pin_capacitance_min`	Returns the sum of all pin capacitances of the net for minimum conditions. *Return type:* float
	Note: For all the `pin_capacitance_*` properties (described above), the pin capacitance matches with the capacitance displayed under the `pin_load` column of the `report_timing` output.
`resistance_max`	Returns the maximum value of resistance of a net. *Return type*: float
`resistance_min`	Returns the minimum value of resistance of a net. *Return type*: float
`total_lumped_capacitance_max_fall`	Returns the maximum value of falling capacitance of a net based on the input library and parasitic model. *Return type:* float
`total_lumped_capacitance_max_rise`	Returns the maximum value of rising capacitance of a net based on the input library and parasitic model. *Return type:* float
`total_lumped_capacitance_min_fall`	Returns the minimum value of falling capacitance of a net based on the input library and parasitic model. *Return type:* float
`total_lumped_capacitance_min_rise`	Returns the minimum value of rising capacitance of a net based on the input library and parasitic model. *Return type:* float
`wire_capacitance_max`	Returns the wire capacitance of the net for maximum conditions. *Return type:* float
`wire_capacitance_min`	Returns the wire capacitance of the net for minimum conditions. *Return type:* float

Net Properties for Power/Ground Objects

`hierarchical_name`	Returns the name of the PG net connected to the corresponding PG pin.
	Return type: string
	
	For example,
	`get_property [get_pg_nets -of_objects [get_cells iA/out_reg] ] hierarchical_name`
	`get_property [get_pg_nets -of_objects [get_cells iA/out_reg] -filter "is_power == true" ] hierarchical_name`

`is_ground`	Returns a value of `true` if the PG net is a ground net.
	Return type: boolean
	
	For example,
	`get_property [get_pg_nets -of_objects [get_cells iA/out_reg] ] is_ground`
	`get_property [get_pg_nets -of_objects [get_pg_pins -of_objects [get_cells iA/out_reg] ]] is_ground`

`is_power`	Returns a value of `true` if the PG net is a power net.
	Return type: boolean
	
	For example,
	`get_property [get_pg_nets -of_objects [get_cells iA/out_reg] ] is_power`
	`get_property [get_pg_nets -of_objects [get_cells iA/out_reg] -filter "name =~ *VDD*" ] is_power`

`voltage_max`	Returns the maximum voltage of a given PG net. This could be voltage associated with a driver term of a net, power intent or CPF, `related_pg_pins` attribute in Liberty, or the operating voltage of a power domain or system default voltage. *Return type*: float For example, `get_property [get_pg_nets -of_objects [get_cells iA/out_reg] ] voltage_max`
`voltage_min`	Returns the minimum voltage of a given PG net. This could be voltage associated with a driver term of a net, power intent or CPF, `related_pg_pins` attribute in Liberty or the operating voltage of a power domain or system default voltage. *Return type*: float For example, `get_property [get_pg_nets -of_objects [get_cells iA/out_reg] ] voltage_min`
`object_type`	Returns `pg_net` as the object type for a library PG pin. *Return type*: string For example, `get_property [get_pg_nets -of_objects [get_cells iA/out_reg]] object_type`

`parent_pg_net`	Returns a collection of a parent power net that is the net powering the power switch that drives the PG net. In case of designs that do not have any power switches powering the instances, this property will always return the net directly powering those instances. It therefore be noted that the usage of this property is more relevant for designs in which the leaf cell instances are powered through power switch cells.
	Return type: Collection
	
	For example,
	`get_property [get_pg_nets mmu/U1/vdd] parent_pg_net`
	`get_property [get_pg_nets -of_objects [get_cells iA/pwr_swtch] ] parent_pg_net`

`top_pg_net`	Returns a collection of the top most un-switched power net of the current PG net. Even in the case of a cascading of power switches present in a design, the software traces through all power switches back to the un-switched top-level primary power net. The top-most un-switched power net will be returned - switched output power net will not be returned.
	Return type: Collection
	
	For example,
	`get_property [get_pg_nets -of_objects [get_cells iA/pwr_swtch] ] top_pg_net`
	`get_property [get_pg_nets -of_objects [get_pg_pins -of_objects [get_cells iA/pwr_swtch] ]] top_pg_net`

Path Group Properties

`name`	Returns the name of the path group. *Return type:* string
`hierarchical_name`	Returns the hierarchical name of the path group. *Return type:* string
`group_type`	Returns the type of group, when `group_path` and `-name`, `-from`, `-to` parameters are specified for the path. For example, `get_property [get_path_groups] group_type` *Return Type*: string
`object_type`	Returns the object type `path_group`. *Return type:* string
`view_name`	Returns the view name for the specified internal clock group. For example, `get_property [get_path_groups m_clk -include_internal_groups] view_name` *Return type:* string

Pin Properties

`actual_latency_early_fall_max`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual early fall insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual early fall insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`actual_latency_early_fall_min`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual early fall insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual early fall insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`actual_latency_early_rise_max`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual early rise source insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual early rise source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float

`actual_latency_early_rise_min`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual early rise source insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual early rise source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`actual_latency_late_fall_max`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual late fall source insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual late fall source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`actual_latency_late_fall_min`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual late fall source insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual late fall source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`actual_latency_late_rise_max`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual late rise source insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual late rise source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`actual_latency_late_rise_min`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual late rise source insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual late rise source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`arrival_clocks`	Returns the data phases, clock source data phases, and latency phases. *Return type:* collection The following global variables support these phases: • `timing_property_arrival_clocks_consider_clock_source_data_phase`: Considers the clock source data phases. • `timing_property_arrival_clocks_consider_data_phase`: Considers the pure data phase. • `timing_property_arrival_clocks_consider_latency_phase`: Considers the latency phase. By default, these global variables are set to `true`.
`arrival_max`	Returns the value of the arrival max at specified pin. You can verify through `report_timing`. For example, `get_property [get_pins <pin name>] arrival_max` *Return Type:* float

`arrival_max_fall`	Returns the arrival time for the falling transition at the max corner. *Return type:* float
`arrival_max_rise`	Returns the arrival time for the rising transition at the max corner. *Return type:* float
`arrival_mean_max_fall`	Returns the mean component of the arrival time for the falling transition at the max corner. *Return type:* float
`arrival_mean_max_rise`	Returns the mean component of the arrival time for the rising transition at the max corner. *Return type:* float
`arrival_mean_min_fall`	Returns the mean component of the arrival time for the falling transition at the min corner. *Return type:* float
`arrival_mean_min_rise`	Returns the mean component of the arrival time for the rising transition at the min corner. *Return type:* float
`arrival_min`	Returns the value of the arrival min at specified pin. You can verify through `report_timing`. For example, `get_property [get_pins <pin name>] arrival_min` *Return Type:* Float
`arrival_min_fall`	Returns the arrival time for the falling transition at the min corner. *Return type:* float
`arrival_min_rise`	Returns the arrival time for the rising transition at the min corner. *Return type:* float
`arrival_sigma_max_fall`	Returns the sigma component of the arrival time for the falling transition at the max corner. *Return type:* float
`arrival_sigma_max_rise`	Returns the mean component of the arrival time for the rising transition at the max corner. *Return type:* float
`arrival_sigma_min_fall`	Returns the sigma component of the arrival time for the falling transition at the min corner. *Return type:* float
`arrival_sigma_min_rise`	Returns the sigma component of the arrival time for the falling transition at the min corner. *Return type:* float
`arrival_window`	Returns the arrival times for the earliest and latest rising and falling transitions in timing window format. *Return type:* string
`attacker_fall_slew`	Returns the minimum falling slew of an attacker driver pin. For example: `get_property [get_pins inst1/y] attacker_fall_slew` *Return type:* float
`attacker_rise_slew`	Returns the minimum rising slew of an attacker driver pin. For example: `get_property [get_pins inst1/y] attacker_rise_slew` *Return type:* float
`capacitance_max`	Returns the value of the maximum pin capacitance specified for the capacitance attribute in the library for the corresponding pin. For example, `get_property [get_pins <pin_name>] capacitance_max` *Return Type:* float

`capacitance_max_fall`	Returns the maximum value of the falling capacitance range of the corresponding library pin. *Return type:* float
`capacitance_max_rise`	Returns the maximum value of the rising capacitance range of the corresponding library pin. *Return type:* float
`capacitance_min`	Returns the value of the minimum pin capacitance specified for the capacitance attribute in the library for the corresponding pin. For example, `get_property [get_pins <pin_name>] capacitance_min` *Return Type:* float
`capacitance_min_fall`	Returns the minimum value of the falling capacitance range of the corresponding library pin. *Return type:* float
`capacitance_min_rise`	Returns the minimum value of the rising capacitance range of the corresponding library pin. **Note**: For the `capacitance_max_*` and `capacitance_min_*` properties (described above), the capacitance value does not match with the `pin_load` (`report_timing -format`) in the timing report because the pin load is a sum of all pin capacitances of a net. *Return type:* float
`cell_name`	Returns the cell name for the corresponding pins. For example, `get_property [get_pins addrs_4_/A] cell_name` *Return type*: string

`clock_pulse_width_high`	Returns the actual high pulse width for the specified pin.
	`create_clock -name CK -period 30 -waveform {0 10} [get_ports {CK}]`
	You can verify through `report_min_pulse_width -clock <clock name>`
	For example,
	`get_property [get_pins <pin_name>] clock_pulse_width_high`
	Return Type: float

`clock_pulse_width_low`	Returns the actual low pulse width for the specified pin.
	`create_clock -name CK -period 30 -waveform {0 10} [get_ports {CK}]`
	You can verify through `report_min_pulse_width -clock <clock name>`
	For example,
	`get_property [get_pins <pin_name>] clock_pulse_width_low`
	Return Type: float

`clock_sources`	Returns a collection of the source pins of all the clocks arriving at the pin. *Return type:* collection
`clocks`	Returns a collection of all of the clocks arriving at the pin. *Return type:* collection
`constant_value`	Returns a constant value of `0` or `1`. *Return type:* integer
`delay_max_fall`	Returns the maximum falling delay - specified using the `set_max_delay -fall` command. *Return type:* float
`delay_max_rise`	Returns the maximum rising delay - specified using the `set_max_delay -rise` command. *Return type:* float

`delay_min_fall`	Returns the minimum falling delay - specified using the `set_min_delay -fall` command. *Return type:* float
`delay_min_rise`	Returns the minimum rising delay - specified using the `set_min_delay -rise` command. *Return type:* float
`direction`	Returns the direction of the pin: `in`, `out`, or `inout`. *Return type:* string
`driver_cell`	Returns the driver cell name for the corresponding pins. For example, `get_property [get_pins ON28_n_17/A] driver_cell` *Return type:* string
`driver_cell_name`	Returns the driving cell instance for the specified pin. For example, `get_property [get_pins <pin name>]driver_cell_name` *Return Type:* string
`driver_ref_lib_cell_name`	Returns the library defined driving cell for the specified pin. For example, `get_property [get_pins <pin name>] driver_ref_lib_cell_name` *Return Type:* string
`fanin`	Returns the number of sources connected with net of the specified pin. *Return type:* integer
`fanout`	Returns the number of sinks connected with the net of the specified pin. *Return type:* integer
`fanout_load`	Returns the fanout load for the pin. *Return type:* float

`fastest_clock`	Returns the collection of the clock name defined for the specified pin.
	`create_generated_clock -name ck -source CK -divide_by 2 <pin name>`
	For example,
	`get_property [get_pins <pin_name>] fastest_clock`
	Return Type: collection

`fastest_clock_name`	Returns the clock name defined for the specified pin.
	`create_generated_clock -name clk -source CLK -multiply_by 2 <pin name>`
	For example,
	`get_property [get_pins <pin name>] fastest_clock_name`
	Return Type: string

`fastest_clock_period`	Returns the clock period of the clock defined for the specified pin.
	`create_clock -name CLK -period 10 -waveform {0 5} [get_ports {CK2}]`
	`create_generated_clock -name clk -source CLK`
	`-multiply_by 3 <pin name>`
	You can verify through `report_clocks`.
	For example,
	`get_property [get_pins <pin_name>] fastest_clock_period`
	Return Type: float

`hierarchical_level`	Returns the hierarchical level of the pin. For example, `get_property [get_pins <pin name>] hierarchical_level` *Return Type:* integer
`hierarchical_name`	Returns the complete hierarchical name of the pin. *Return type:* string
`hold_uncertainty`	Returns the most conservative uncertainty of all possible uncertainty assertions associated with the pin. *Return type:* float

`holding_resistance_high`	Returns the highest holding resistance of a pin.
	For example,
	`foreach pin $pinList {`
	`set vicArray [get_property [get_pins $pin] noise_victim]`
	`foreach_in_collection vic $vicArray {`
	`get_property $vic holding_resistance_high`
	`}`
	Return type: float

`holding_resistance_low`	Returns the lowest holding resistance of a pin. *Return type:* float
`interp_info_max`	Returns information for late analysis. When specified, the report output will show the data for interpolation, extrapolation, and/or matched information for late analysis, along with the library details. *Return type:* string
`interp_info_min`	Returns information for early analysis. When specified, the report output will show the data for interpolation, extrapolation, and/or matched information for early analysis, along with the library details. *Return type:* string
`is_async`	Returns a value of `true` if the pin is an asynchronous clear or preset pin. *Return type:* boolean
`is_clear`	Returns a value of `true` if the pin is an asynchronous clear pin. *Return type:* boolean
`is_clock`	Returns a value of `true` if the pin has the Liberty pin attribute: `clock`. *Return type:* boolean
`is_clock_gating`	Returns a value of `true` if the pin is defined as a pin of a clock gating cell. *Return type:* boolean
`is_clock_gating_clock`	Returns a value of `true` if the pin is defined as a clock pin of a clock gating cell. *Return type:* boolean
`is_clock_gating_enable`	Returns a value of `true` if the pin corresponds to the enable pin of a clock gating cell. *Return type:* boolean

`is_clock_root`	Returns `true` for a pin or port if real clock or generated clock is defined on the pin/port.
	`create_generated_clock -name clk -source CLK -multiply_by 2 <pin name>`
	For example,
	`get_property [get_pins <pin_name>] is_clock_root`
	Return Type: boolean

`is_clock_used_as_clock`	Returns a value of `true` if the pin lies in the clock network and at least one of the clocks arriving at the pin is used as a clock in the downstream network of the pin. When the `-clock` parameter is specified, this property returns `true` if the above condition is satisfied for the specified clock. *Return type*: boolean
`is_clock_used_as_data`	Returns a value of `true` if the pin lies in the clock source path and at least one of the clocks arriving on the pin is used as data in the downstream network of the pin. When the `-clock` parameter is specified, this property returns `true` if the above condition is satisfied for the specified clock. *Return type*: boolean
`is_data`	Returns a value of `true` if the pin is a data pin of a flip-flop (that is, is not a clock pin). *Return type:* boolean
`is_disable_timing`	Returns a value of `true` if the pin's timing has been disabled. Return type: boolean **Note**: This property checks if the associated arc for the pin is active for propagation and analysis.
`is_fall_edge_triggered_clock`	Returns a value of `true` if the pin is a clock pin of a flop, and is triggered by the falling edge of a clock. *Return type:* boolean
`is_fall_edge_triggered_data`	Returns a value of `true` if the pin corresponds to the data pin of a fall edge triggered device. *Return value:* boolean
`is_hierarchical`	Returns a value of `true` if the pin is a pin of a hierarchical module. *Return type:* boolean
`is_isolated`	Returns a value of `true` when a pin is connected to an isolated instance. The `is_isolation` attribute indicates that the isolation cell is inside a module. So if the module is used as macro or black-box, the software will interpret the pin to be already isolated and no additional isolation will be required. *Return type:* boolean
`is_isolation_cell_data`	Returns `true` if the instance signal pin corresponding to the `isolation_cell_data_pin` attribute of a library signal pin is set to `true`, indicating that the library cell signal pin is a data pin of an isolation library cell. **Note** : The `is_isolation_cell` attribute must be set to `true` in the library. For example, `get_property [get_pins <pin_name>] is_isolation_cell_data` *Return Type:* boolean
`is_isolation_cell_enable`	Returns `true` if the instance signal pin corresponding to the `isolation_cell_enable_pin` attribute of a library signal pin is set to `true`, indicating that the library cell signal pin is an enable or control pin of an isolation library cell. **Note** : The `is_isolation_cell` attribute must be set to `true` in the library. For example, `get_property [get_pins <pin_name>] is_isolation_cell_enable` *Return Type:* boolean

`is_latency_network_pin`	Returns `true` if the specified pin is having generated or created clock.
	`create_generated_clock -name ck -source CK -divide_by 2 <pin name>`
	For example,
	`get_property [get_pins <pin name>] is_latency_network_pin`
	Return Type: boolean

is_level_shifter_enable	Returns true if the instance signal pin corresponding to the level_shifter_enable_pin attribute of a library signal pin is set to true, indicating that the library cell signal pin is a enable pin of an isolation library cell. **Note:** The is_level_shifter attribute must be set to true in the library. For example, get_property [get_pins <pin_name>] is_isolation_cell_enable *Return Type:* boolean
is_level_shifter_data	Returns true if the instance signal pin corresponding to the level_shifter_data_pin attribute of a library signal pin is set to true, indicating that the library cell signal pin is a data pin of an isolation library cell. **Note:** The is_level_shifter attribute must be set to true in the library. For example, get_property [get_pins <pin_name>] is_level_shifter_data" *Return Type:* boolean
is_multiple_clock_fanin_point	Returns a value of true if multiple clock phases converge at the pin. *Return type:* boolean
is_mux_select_pin	Returns true if the specified pin is the mux select pin. For example, get_property [get_pins m1/S] is_mux_select_pin *Return Type:* boolean
is_negative_level_sensitive_clock	Returns a value of true if the library pin is an enable pin of an active low level-sensitive device. *Return type:* boolean
is_negative_level_sensitive_data	Returns a value of true if the pin is a data pin of an active low level-sensitive device. *Return type:* boolean
is_pin	Returns a value of true. The is_pin and is_port queries are provided for both pin and port objects to provide a quick way of determining the object type of an identifier. is_port always returns false for pins. is_pins always returns false for ports. *Return type:* boolean
is_port	Returns a value of false. The is_pin and is_port queries are provided for both pin and port objects to provide a quick way of determining the object type of an identifier. is_port always returns false for pins. is_pins always returns false for ports. *Return type:* boolean
is_positive_level_sensitive_clock	Returns a value of true if the library pin is an enable pin of an active high level-sensitive device. *Return type:* boolean
is_positive_level_sensitive_data	Returns a value of true if the pin is a data pin of an active high level-sensitive device. *Return type:* boolean
is_preset	Returns a value of true if the pin is a preset pin. *Return type:* boolean
is_propagated_clock	Returns a value of true if there is an explicit set_propagated_clock assertion at the pin. *Return type:* boolean
is_rise_edge_triggered_clock	Returns a value of true if the pin is a clock pin of a flop, and is triggered by the rising edge of a clock. *Return type:* boolean
is_rise_edge_triggered_data	Returns a value of true if the pin corresponds to the data pin of a rise edge-triggered device. *Return type:* boolean

`is_tristate`	Returns a value of `true` if the pin has the `three_state` attribute in the Liberty timing library. *Return type:* boolean
`is_tristate_enable`	Returns a value of `true` if the pin is the source pin of timing arcs with either the `three_state_enable` or `three_state_disable` attribute in the Liberty timing library. *Return type:* boolean
`is_tristate_output`	Returns a value of `true` if the pin corresponds to a three-state output pin. *Return type:* boolean
`latency_fall_max`	Returns the maximum fall insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`latency_fall_min`	Returns the minimum fall insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`latency_rise_max`	Returns the maximum rise insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`latency_rise_min`	Returns the minimum rise insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`lib_pins`	Returns the collection of the library pin for the specified pin. For example, `get_property [get_pins <pin name>] lib_pins` *Return Type:* collection
`max_capacitance`	Returns the maximum capacitance limit for the pin. *Return type:* float
`max_fanout`	Returns the maximum fanout load that the pin can drive. This value is set using `set_max_fanout` or the `default_max_fanout` library attribute. *Return type:* float
`max_time_borrow`	Returns the value of the maximum time borrowed for the specified pin when the `set_max_time_borrow` parameter is specified. For example, `get_property  [get_pins <pin name> ] max_time_borrow` *Return Type:* float
`max_transition`	Returns the maximum transition time limit specified for the pin. *Return type:* float
`min_capacitance`	Returns the value of the minimum capacitance for the specified pin when the `set_min_capacitance` parameter is specified. For example, `get_property [get_pins <pin name>] min_capacitance` *Return Type:* float
`min_fanout`	Returns the minimum fanout design rule limit of the corresponding library pin. *Return type:* float
`min_transition`	Returns the value of the minimum transition for the specified pin. For example, `get_property [get_pins <pin name>] min_transition` *Return Type:* float

`name`	Returns the leaf-level name of the pin. For example, `get_property [get_pins <pin name>] name` *Return Type:* string
`net_name`	Returns the name of the net connected to the specified pin. *Return type:* string
`noise_victim`	Returns a collection of `si_victim` objects that can be used to query glitch attributes. *Return type:* collection
`object_type`	Returns the object type `pin`. *Return type:* string
`power_rail_voltage_bidir_input_max`	Reports power rail voltage for input part of bidi pins/ports for maximum operating condition. *Return type:* float
`power_rail_voltage_bidir_input_min`	Reports power rail voltage for input part of bidi pins/ports for minimum operating condition. *Return type:* float
`power_rail_voltage_max`	Reports power rail voltage for maximum operating condition for bidirectional, input and output pins. For bidirectional pins, the power rail voltage for output signal is reported. *Return type:* float
`power_rail_voltage_min`	Reports power rail voltage for minimum operating condition for bidirectional, input and output pins. For bidirectional pins, the power rail voltage for output signal is reported. *Return type:* float
`receiver_ccc_type`	Returns the type of receiver cell model. The return values can be udn, single_ccc, dual_ccc, multi_ccc, or black_box. This attribute applies to receiver pins only. For example, `get_property [get_pins inst1/a] receiver_ccc_type` *Return type:* string
`ref_lib_pin_name`	Returns the name of the library pin associated with the instance pin. *Return type:* string
`setup_uncertainty`	Returns the most conservative uncertainty of all possible uncertainty assertions associated with the pin. *Return type:* float
`si_slew_max`	Returns the maximum slew from all the incoming signals after performing SI analysis. This value is a maximum of `si_slew_max_rise` and `si_slew_max_fall`. *Return type:* float
`si_slew_mean_max_fall`	Returns the mean component of maximum falling slew from the incoming signals after SI analysis is performed. *Return type:* float
`si_slew_mean_max_rise`	Returns the mean component of maximum rising slew from the incoming signals after SI analysis is performed. *Return type:* float
`si_slew_mean_min_fall`	Returns the mean component of minimum falling slew from the incoming signals after SI analysis is performed. *Return type:* float
`si_slew_mean_min_rise`	Returns the mean component of minimum rising slew from the incoming signals after SI analysis is performed. *Return type:* float
`si_slew_min`	Returns the minimum slew from all the incoming signals after performing SI analysis. This value is a minimum of `si_slew_min_rise` and `si_slew_min_fall`. *Return type:* float

`si_victim`	Returns a collection of the `si_victim` objects that can be used to query graph-based SI delay attributes. *Return type:* collection
`slack_max`	Returns the slack time for a timing path at the max corner. *Return type:* float
`slack_max_edge`	Returns the edge (rise or fall) of the worst slack-causing path at the specified pin in late mode. *Return type:* string
`slack_max_fall`	Returns the slack time for the falling transition at the max corner. *Return type:* float
`slack_max_rise`	Returns the slack time for the rising transition at the max corner. When the `-view` parameter is not specified, the worst slack for all the views is returned. *Return type:* float
`slack_mean_max`	Returns the maximum mean component of the slack time for a timing path. *Return type:* float
`slack_mean_min`	Returns the minimum mean component of the slack time for a timing path. *Return type:* float
`slack_mean_max_fall`	Returns the mean component of the slack time for the falling transition at the max corner. *Return type:* float
`slack_mean_max_rise`	Returns the mean component of the slack time for the rising transition at the max corner. *Return type:* float
`slack_mean_min_fall`	Returns the mean component of the slack time for the falling transition at the min corner. *Return type:* float
`slack_mean_min_rise`	Returns the mean component of the slack time for the rising transition at the min corner. Return type: float
`eslack_min`	Returns the slack time for a timing path at the min corner. *Return type:* float
`slack_min_edge`	Returns the edge (rise or fall) of the worst slack-causing path at the specified pin in early mode. *Return type:* string
`slack_min_fall`	Returns the slack time for the falling transition at the min corner. *Return type:* float
`slack_min_rise`	Returns the slack time for the rising transition at the min corner. *Return type:* float
`slack_sigma_max_fall`	Returns the sigma component of the slack time for the falling transition at the max corner. *Return type:* float
`slack_sigma_max_rise`	Returns the sigma component of the slack time for the rising transition at the max corner. *Return type:* float
`slack_sigma_min_fall`	Returns the sigma component of the slack time for the falling transition at the min corner. *Return type:* float
`slack_sigma_min_rise`	Returns the sigma component of the slack time for the rising transition at the min corner. *Return type:* float

`slew_max`	Returns the value of the maximum slew for the specified pin. You can verify through `report_timing`. For example, `get_property [get_pins <pin name>] slew_max` *Return Type:* float
`slew_max_fall`	Returns the slew time for the falling transition at the max corner. *Return type:* float
`slew_max_rise`	Returns the slew time for the rising transition at the max corner. *Return type:* float
`slew_mean_max_fall`	Returns the mean component of the slew time for the falling transition at the max corner. *Return type:* float
`slew_mean_max_rise`	Returns the mean component of the slew time for the rising transition at the max corner. *Return type:* float
`slew_mean_min_fall`	Returns the mean component of the slew time for the falling transition at the min corner. *Return type:* float
`slew_mean_min_rise`	Returns the mean component of the slew time for the rising transition at the min corner. *Return type:* float
`slew_min`	Returns the value of the minimum slew for the specified pin. You can verify through `report_timing`. For example, get_property [get_pins <pin name>] slew_min *Return Type:* float
`slew_min_fall`	Returns the slew time for the falling transition at the min corner. *Return type:* float
`slew_min_rise`	Returns the slew time for the rising transition at the min corner. *Return type:* float
`slew_sigma_max_fall`	Returns the sigma component of the slew time for the falling transition at the max corner. *Return type:* float
`slew_sigma_max_rise`	Returns the sigma component of the slew time for the rising transition at the max corner. *Return type:* float
`slew_sigma_min_fall`	Returns the sigma component of the slew time for the falling transition at the min corner. *Return type:* float
`slew_sigma_min_rise`	Returns the sigma component of the slew time for the falling transition at the min corner. *Return type:* float
`source_latency_early_fall_max`	Returns the maximum early fall source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_early_fall_min`	Returns the minimum early fall source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_early_rise_max`	Returns the maximum early rise source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_early_rise_min`	Returns the minimum early rise source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float

`source_latency_late_fall_max`	Returns the maximum late fall source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_late_fall_min`	Returns the minimum late fall source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_late_rise_max`	Returns the maximum late rise source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_late_rise_min`	Returns the minimum late rise source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`stolen_slack`	Returns the slack stolen at the specified pin. This property can be queried only for pins in late mode. **Note:** The specified pin must be the endpoint of a transparent latch flush arc. *Return type:* float
`user_constant_value`	Returns constant values from netlist or constraints. *Return type*: integer
`x_coordinate`	Returns the x coordinates of the placed pin. *Return type:* float
`y_coordinate`	Returns the y coordinates of the placed pin. *Return type:* float

Pin Properties for Power/Ground Objects	
`input_signal_level`	Returns the rail name of the `related_power_pin` of an input signal pin. *Return type:* string For example, `get_property [get_pins mmu/U1/I] input_signal_level`
`input_signal_level_voltage`	Returns the rail voltage of a rail of the `related_power_pin` attribute of the input signal pin. *Return type:* float For example, `get_property [get_pins mmu/U1/I] input_signal_level_voltage`
`is_always_on`	Returns a value of `true` if an instance pin is an always-on pin. *Return type:* boolean For example, `get_property [get_pins mmu/U1/AON] is_always_on`
`is_isolation_cell_data`	Returns a value of `true` if the instance signal pin is the data pin of an isolation cell instance. *Return type:* boolean For example, `get_property [get_pins mmu/U2/ISO] is_isolation_cell_data`
`is_isolation_cell_enable`	Returns a value of `true` if the instance signal pin is the enable pin of an isolation cell instance. *Return type:* boolean For example, `get_property [get_pins mmu/U2/ISO_EN] is_isolation_cell_enable`
`is_level_shifter_data`	Returns a value of `true` if the instance signal pin is the data pin of a level-shifter cell instance. *Return type:* boolean For example, `get_property [get_pins mmu/LVL/IN] is_level_shifter_data`

`is_level_shifter_enable`	Returns a value of `true` if the instance signal pin is the enable pin of a level-shifter cell instance. *Return type:* boolean For example, `get_property [get_pins mmu/LVL/EN] is_level_shifter_enable`
`output_signal_level`	Returns the rail name of the `related_power_pin` attribute of the output/inout signal pin. *Return type:* string For example, `get_property [get_pins mmu/U1/Y] output_signal_level`
`related_ground_pin`	Returns the related ground pins as a collection for the corresponding instance pins. *Return type:* collection For example, `get_property [get_pins mmu/U1/I] related_ground_pin`
`related_power_pin`	Returns the related power pins as a collection for the corresponding instance pins. *Return type:* collection For example, `get_property [get_pins mmu/U1/I] related_power_pin`

Pin Properties for Power/Ground Objects

`hierarchical_name`	Returns the complete hierarchical name of the PG pin.
	Return type: string
	
	For example,
	`get_property [get_pg_pins -of_objects [get_cells iA/out_reg] ] hierarchical_name`
	`get_property [get_pg_pins -of_objects [get_cells iA/out_reg] -filter "pg_type == primary_power" ] hierarchical_name`

`voltage_max`	Returns the maximum voltage of a given PG pin. This could be the voltage associated with a pin, power intent or CPF, `related_pg_pins` attribute in Liberty, or the operating voltage of a power domain or system default voltage. *Return type:* float For example, `get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] voltage_max`
`voltage_min`	Returns the minimum voltage of a given PG pin. This voltage may be associated with a pin, power intent or CPF, `related_pg_pins` attribute in Liberty, or the operating voltage of a power domain or system default voltage. *Return type*: float For example, `get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] voltage_min`
`net`	Returns the immediate PG net(s) connected to the corresponding PG pin objects, as a collection. *Return type*: Collection For example, `get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] net`

`pg_type`	Returns the type of PG pin.
	Return type: string
	
	For example,
	`get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] pg_type`
	`get_property [get_pg_pins -of_objects [get_cells iA/out_reg] -filter "hierarchical_name =~ *VDD*" ] pg_type`

`ref_lib_pin_name`	Returns the name of the library PG pin associated with an instance PG pin. *Return type*: string For example, `get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] ref_lib_pin_name`

Port Properties

`arrival_max_fall`	Returns the worst arrival on the port for a falling signal. *Return type:* float
`arrival_max_rise`	Returns the worst arrival on the port for a rising signal. *Return type:* float
`arrival_min_fall`	Returns the best arrival on the port for a falling signal. *Return type:* float
`arrival_min_rise`	Returns the best arrival on the port for a rising signal. *Return type:* float
`arrival_window`	Returns the arrival times for the earliest and latest rising and falling transitions in timing window format. *Return type:* string
`clock_sources`	Returns a collection of the source pins of all the clocks arriving at the port. *Return type:* collection
`clocks`	Returns a collection of all of the clocks arriving at the port. *Return type:* collection
`constant_value`	Returns a constant value of `0` or `1`. *Return type:* integer
`capacitance_max`	Returns the maximum pin capacitance for the port. *Return type:* float
`capacitance_min`	Returns the minimum pin capacitance for the port. *Return type:* float
`delay_max_fall`	Returns the maximum falling delay value for the port. *Return type:* float
`delay_max_rise`	Returns the maximum rising delay value for the port. *Return type:* float
`delay_min_fall`	Returns the minimum falling delay value for the port. *Return type:* float
`delay_min_rise`	Returns the minimum rising delay value for the port. *Return type:* float
`direction`	Returns the direction of the port: `in`, `out`, or `inout`. *Return type:* string
`driving_cell_no_design_rule`	Returns a value of `true` if there is no design rule transfer from the driving cell set on a port. For example, if a driving cell is defined with the following command, then this property will return `true`: `set_driving_cell -lib_cell <lib_cell_name> -no_design_rule <port>`
`drive_resistance_fall_max`	Returns the falling linear drive resistance at the port for the max condition. *Return type:* float
`drive_resistance_fall_min`	Returns the falling linear drive resistance at the port for the min condition. *Return type:* float

`drive_resistance_rise_max`	Returns the rising linear drive resistance at the port for the max condition. *Return type:* float
`drive_resistance_rise_min`	Returns the rising linear drive resistance at the port for the min condition. *Return type:* float
`driving_cell_fall_max`	Returns the name of the library cell used to compute max falling delays and transitions at the port. *Return type:* string
`driving_cell_fall_min`	Returns the name of the library cell used to compute min falling delays and transitions at the port. *Return type:* string
`driving_cell_from_pin_fall_max`	Returns the input pin of the driving cell used in the max fall delay calculation at the port. *Return type:* string
`driving_cell_from_pin_fall_min`	Returns the input pin of the driving cell used in the min fall delay calculation at the port. *Return type:* string
`driving_cell_from_pin_rise_max`	Returns the input pin of the driving cell used in max rise delay calculation at the port. *Return type:* string
`driving_cell_from_pin_rise_min`	Returns the input pin of the driving cell used in min rise delay calculation at the port. *Return type:* string
`driving_cell_library_fall_max`	Returns the name of the library used to compute max falling delays and transitions at the port. *Return type:* string
`driving_cell_library_fall_min`	Returns the name of the library used to compute min falling delays and transitions at the port. *Return type:* string
`driving_cell_library_rise_max`	Returns the name of the library used to compute max rising delays and transitions at the port. *Return type:* string
`driving_cell_library_rise_min`	Returns the name of the library used to compute min rising delays and transitions at the port. *Return type:* string
`driving_cell_max_fall_itrans_fall`	Returns the falling input transition of the `from_pin` of the driving cell, which is used for the max falling delay calculation at the port. *Return type:* float
`driving_cell_max_fall_itrans_rise`	Returns the falling input transition of the `from_pin` of the driving cell, which is used for the max rising delay calculation at the port. *Return type:* float
`driving_cell_max_rise_itrans_fall`	Returns the rising input transition of the `from_pin` of the driving cell, which is used for the max falling delay calculation at the port. *Return type:* float
`driving_cell_max_rise_itrans_rise`	Returns the rising input transition of the `from_pin` of the driving cell, which is used for the max rising delay calculation at the port. *Return type:* float
`driving_cell_min_fall_itrans_fall`	Returns the falling input transition of the `from_pin` of the driving cell, which is used for the min falling delay calculation at the port. *Return type:* float
`driving_cell_min_fall_itrans_rise`	Returns the falling input transition of the `from_pin` of the driving cell, which is used for the min rising delay calculation at the port. *Return type:* float

`driving_cell_min_rise_itrans_fall`	Returns the rising input transition of the `from_pin` of the driving cell, which is used for the min falling delay calculation at the port. *Return type:* float
`driving_cell_min_rise_itrans_rise`	Returns the rising input transition of the `from_pin` of the driving cell, which is used for the min rising delay calculation at the port. *Return type:* float
`driving_cell_pin_fall_max`	Returns the name of the output pin used for max fall delay calculation at the port. *Return type:* string
`driving_cell_pin_fall_min`	Returns the name of the output pin used for min fall delay calculation at the port. *Return type:* string
`driving_cell_pin_rise_max`	Returns the name of the output pin used for max rise delay calculation at the port. *Return type:* string
`driving_cell_pin_rise_min`	Returns the name of the output pin used for min rise delay calculation at the port. *Return type:* string
`driving_cell_rise_max`	Returns the name of the library cell used to compute max rising delays and transitions at the port. *Return type:* string
`driving_cell_rise_min`	Returns the name of the library cell used to compute min rising delays and transitions at the port. *Return type:* string
`fanin`	Returns the number of sources connected with net of the specified port. *Return type:* integer
`fanout`	Returns the number of sinks connected with the net of the specified port. *Return type:* integer
`fanout_load`	Returns the fanout load for ports. (For input ports, the value is the sum of all fanout loads of all connected pins. For output ports, the value is set using `set_fanout_load`.) *Return type:* float
`hierarchical_name`	Returns the complete hierarchical name of the port. *Return type:* string
`hold_uncertainty`	Returns the most conservative uncertainty of all possible uncertainty assertions associated with the port. *Return type:* float
`input_slew_max_fall`	Returns the max falling slew for the input or inout ports. (This value is set with the `set_input_transition` command.) *Return type:* float
`input_slew_max_rise`	Returns the max rising slew for the input or inout ports. (This value is set with the `set_input_transition` command.) *Return type:* float
`input_slew_min_fall`	Returns the min falling slew for the input or inout ports. (This value is set with the `set_input_transition` command.) *Return type:* float
`input_slew_min_rise`	Returns the min rising slew for the input or inout ports. (This value is set with the `set_input_transition` command.) *Return type:* float
`is_disable_timing`	Returns a value of `true` if the timing of the port has been disabled using the `set_disable_timing` command. *Return type:* boolean
`is_hierarchical`	Returns a value of `true` if the port is a port of a hierarchical module. *Return type:* boolean

is_pin	Returns a value of false. The is_pin and is_port queries are provided for both pin and port objects to provide a quick way of determining the object type of an identifier. is_port always returns false for pins. is_pins always returns false for ports. *Return type:* boolean
is_port	Returns a value of true. The is_pin and is_port queries are provided for both pin and port objects to provide a quick way of determining the object type of an identifier. is_port always returns false for pins. is_pins always returns false for ports. *Return type:* boolean
is_propagated_clock	Returns a value of true if there is an explicit set_propagated_clock assertion at the port. *Return type:* boolean
latency_fall_max	Returns the maximum fall insertion delay specified by an explicit set_clock_latency at the port. *Return type:* float
latency_fall_min	Returns the minimum fall insertion delay specified by an explicit set_clock_latency at the port. *Return type:* float
latency_rise_max	Returns the maximum rise insertion delay specified by an explicit set_clock_latency at the port. *Return type:* float
latency_rise_min	Returns the minimum rise insertion delay specified by an explicit set_clock_latency at the port. *Return type:* float
max_fanout	Returns the maximum fanout load that the port can drive. (This value is set using set_max_fanout, or the default_max_fanout library attribute.) *Return type:* float
max_transition	Returns the maximum transition time limit specified for the port. *Return type:* float
net_name	Returns the name of the net connected to the specified port. *Return type:* string
noise_victim	Returns a collection of si_victim objects that can be used to query glitch attributes. *Return type:* collection
object_type	Returns the object type port. *Return type:* string
setup_uncertainty	Returns the most conservative uncertainty of all possible uncertainty assertions associated with the port. *Return type:* float
si_victim	Returns a collection of the si_victim objects that can be used to query graph-based SI delay attributes. *Return type:* collection
slack_max_edge	Returns the edge (rise or fall) of the worst slack-causing path at the specified port in late mode. *Return type:* string
slack_max_fall	Returns the worst setup slack for a falling signal at the port endpoint. *Return type:* float
slack_max_rise	Returns the worst setup slack for a rising signal at the port endpoint. When the -view parameter is not specified, the worst slack for all the views is returned. *Return type:* float

`slack_min_edge`	Returns the edge (rise or fall) of the worst slack-causing path at the specified port in early mode. *Return type:* string
`slack_min_fall`	Returns the worst hold slack for a falling signal at the port endpoint. *Return type:* float
`slack_min_rise`	Returns the worst hold slack for a rising signal at the port endpoint. *Return type:* float
`slew_max_fall`	Returns the maximum falling slew from all of the incoming signals on the port. *Return type:* float
`slew_max_rise`	Returns the maximum rising slew from all of the incoming signals on the port. *Return type:* float
`slew_min_fall`	Returns the minimum falling slew from all of the incoming signals on the port. *Return type:* float
`slew_min_rise`	Returns the minimum rising slew from all of the incoming signals on the port. *Return type:* float
`source_latency_early_fall_max`	Returns the maximum early fall source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_early_fall_min`	Returns the minimum early fall source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_early_rise_max`	Returns the maximum early rise source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_early_rise_min`	Returns the minimum early rise source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_late_fall_max`	Returns the maximum late fall source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_late_fall_min`	Returns the minimum late fall source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_late_rise_max`	Returns the maximum late rise source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_late_rise_min`	Returns the minimum late fall source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`user_constant_value`	Returns constant values from netlist or constraints. *Return type*: integer
`x_coordinate`	Returns the x coordinates of the placed port. *Return type:* float
`y_coordinate`	Returns the y coordinates of the placed port. *Return type:* float

Timing Arc Properties

`aocv_derate_capture_clock_early_fall`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early capture clock paths with fall sink pin transitions. *Return type:* float
`aocv_derate_capture_clock_early_rise`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early capture clock paths with rise sink pin transitions. *Return type:* float
`aocv_derate_capture_clock_late_fall`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late capture clock paths with fall sink pin transitions. *Return type:* float
`aocv_derate_capture_clock_late_rise`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late capture clock paths with rise sink pin transitions. *Return type:* float
`aocv_derate_data_early_fall`	Returns AOCV derate values for a timing arc on an early data path with fall transitions. *Return type:* float
`aocv_derate_data_early_rise`	Returns AOCV derate values for a timing arc on an early data path with rise transitions. *Return type:* float
`aocv_derate_data_late_fall`	Returns AOCV derate values for a timing arc on a late data path with fall transitions. *Return type:* float
`aocv_derate_data_late_rise`	Returns AOCV derate values for a timing arc on a late data path with rise transitions. *Return type:* float
`aocv_derate_launch_clock_early_fall`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early launch clock paths with fall sink pin transitions. *Return type:* float
`aocv_derate_launch_clock_early_rise`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early launch clock paths with rise sink pin transitions. *Return type:* float
`aocv_derate_launch_clock_late_fall`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late launch clock paths with fall sink pin transitions. *Return type:* float
`aocv_derate_launch_clock_late_rise`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late launch clock paths with rise sink pin transitions. *Return type:* float
`aocv_stage_count_capture_clock_early`	Returns graph based AOCV stage count values in AOCV mode for a given timing arc that is a part of early capture clock paths. *Return type:* float
`aocv_stage_count_capture_clock_late`	Returns graph based AOCV stage count values in AOCV mode for a given timing arc that is a part of late capture clock paths. *Return type:* float
`aocv_stage_count_data_early`	Returns AOCV stage count values for a timing arc on an early data path. *Return type:* float
`aocv_stage_count_data_late`	Returns AOCV stage count values for a timing arc on a late data path. *Return type:* float
`aocv_stage_count_launch_clock_early`	Returns AOCV stage count values in AOCV mode for a given timing arc that is a part of early launch clock paths. *Return type:* float

`aocv_stage_count_launch_clock_late`	Returns AOCV stage count values in AOCV mode for a given timing arc that is a part of late launch clock paths. *Return type:* float
`arc_type`	Returns the Liberty `timing_type` attribute of the arc. *Return type:* string
`delay_max_fall`	Returns the fall delay for the max corner. *Return type:* float
`delay_max_rise`	Returns the rise delay for the max corner. *Return type:* float
`delay_mean_max_fall`	Returns the mean component of the maximum falling delay value for the timing arc. *Return type*: float
`delay_mean_max_rise`	Returns the mean component of the maximum rising delay value for the timing arc. *Return type*: float
`delay_mean_min_fall`	Returns the mean component of the minimum falling delay value for the timing arc. *Return type*: float
`delay_mean_min_rise`	Returns the mean component of the minimum rising delay value for the timing arc. *Return type*: float
`delay_min_fall`	Returns the fall delay for the min corner. *Return type:* float
`delay_min_rise`	Returns the rise delay for the min corner. *Return type:* float
`delay_sigma_max_fall`	Returns the 1-sigma variation component of the maximum falling delay for the specified timing arc. *Return type*: float
`delay_sigma_max_rise`	Returns the 1-sigma variation component of the maximum rising delay for the specified timing arc. *Return type*: float
`delay_sigma_min_fall`	Returns the 1-sigma variation component of the minimum falling delay for the specified timing arc. *Return type*: float
`delay_sigma_min_rise`	Returns the 1-sigma variation component of the minimum rising delay for the specified timing arc. Return type: float
`delta_delay_max_fall`	Returns the delta fall delay for the max corner. *Return type:* float
`delta_delay_max_rise`	Returns the delta rise delay for the max corner. *Return type:* float
`delta_delay_min_fall`	Returns the delta fall delay for the min corner. *Return type:* float
`delta_delay_min_rise`	Returns the delta rise delay for the min corner. *Return type:* float
`is_cellarc`	Returns a value of `true` if the arc belongs to a cell. *Return type:* boolean
`is_disabled`	Returns a value of true if `set_disable_timing` constraint exists for an arc. *Return type:* boolean

`mode`	Returns the mode specified for the timing arc in the library. *Return type:* string
`object_type`	Returns the object type `timing_arc`. *Return type:* string
`sdf_cond`	Returns the `sdf_cond` expression specified for the timing arc in the library. *Return type:* string
`sdf_cond_end`	Returns the `sdf_cond_end` expression specified for the timing arc in the library. *Return type:* string
`sdf_cond_start`	Returns the `sdf_cond_start` expression specified for the timing arc in the library. *Return type:* string
`sense`	Returns the sense of the timing arc. *Return type:* string
`sink_pin`	Returns the sink pin of the delay arc, or the reference pin of the check arc. *Return type:* collection
`source_pin`	Returns the source pin of the delay arc, or the signal pin of the check arc. *Return type:* collection
`when`	Returns the `when` condition specified for the timing arc in the library. *Return type:* string

Timing Path Properties

`applied_exception_type`	Returns the type of applied exceptions for a timing path. This property can be used to query dominant timing exceptions affecting a timing path. You can use this property to query on constrained/unconstrained timing paths. The possible return values are - multi_cycle, path_delay and false_path - indicating multicycle path, minimum/maximum delay path, and timing false path, respectively. The software will return one of these values for pin-based timing exceptions. However, the software returns “NA” when false paths are defined for clock objects, or if the paths do not have any related timing exception. *Return Type*: String
`arrival`	Returns the arrival time at the timing path. *Return type*: float
`arrival_mean`	Returns the mean component of the arrival time for the timing path. *Return type*: float
`arrival_sigma`	Returns the sigma component of the arrival time for the timing path. *Return type*: float
`capture_clock_path`	Returns the capturing clock path of the timing path. This property can be used only for path_type full_clock. *Return type:* collection
`capturing_clock`	Returns the capturing clock of the timing path. *Return type:* collection

`capturing_clock_close_edge_time`	Returns the closing edge time of the capturing clock. *Return type:* float
`capturing_clock_close_edge_type`	Returns the capturing clock edge direction: `rise` or `fall`. *Return type:* string
`capturing_clock_is_inverted`	Returns a value of true if the phase of the clock at the end point of the capture clock path is opposite to the phase of the capturing clock at the source. *Return type:* boolean
`capturing_clock_is_propagated`	Returns a value of `true` if the capturing clock is in the propagated mode, at the clock end point. *Return type:* boolean
`capturing_clock_latency`	Returns the ideal or propagated latency of the capturing clock. *Return type:* float
`capturing_clock_open_edge_type`	Returns the opening edge time of the capturing clock. *Return type:* string
`capturing_clock_pin`	Returns the name of the capturing clock pin. *Return type:* collection
`capturing_clock_source_arrival_time`	Returns the capturing clock arrival time at the clock root pin/port of the capturing clock path. This value is a sum of the clock edge time and the source latency constraints specified at the clock root. **Note:** You must specify `report_timing -path_type full_clock` in order to return capturing clock arrival time information. *Return type:* float
`capturing_clock_source_arrival_time_mean`	Returns the mean component of the capturing clock arrival time at the clock root pin/port of the capturing clock path. *Return type:* float
`capturing_clock_source_arrival_time_sigma`	Returns the sigma component of the capturing clock arrival time at the clock root pin/port of the capturing clock path. *Return type:* float
`capturing_point`	Returns a pointer to the end point of the timing path. *Return type:* collection
`capturing_point_is_level_sensitive`	Returns a value of `true` if the end point of the data path is level sensitive. *Return type:* boolean
`check_delay`	Returns the check delay value for the timing path. *Return type:* float
`check_delay_mean`	Returns the mean component of the check delay value for the timing path. *Return type:* float
`check_delay_sigma`	Returns the sigma component of the check delay value for the timing path. *Return type:* float
`clock_path_end_point`	Returns the last point in the capture clock path of the timing path. *Return type:* collection
`clock_uncertainty`	Returns the clock uncertainty of the timing path. *Return type:* float
`cppr_adjustment`	Returns the CPPR adjustment of the timing path. *Return type:* float

`cppr_adjustment_mean`	Returns the mean component of the CPPR adjustment of a timing path. *Return type:* float
`cppr_adjustment_sigma`	Returns the sigma component of the CPPR adjustment of a timing path. *Return type:* float
`cppr_branch_point`	Returns the CPPR branch point of the given timing path. *Return Type*: collection
`drive_adjustment`	Returns the drive adjustment value for the timing path. Return type: float
`drive_adjustment_mean`	Returns the mean component of the drive adjustment value for the timing path. Return type: float
`drive_adjustment_sigma`	Returns the sigma component of the drive adjustment value for the timing path. Return type: float
`external_delay`	Returns the value of the `set_output_delay` constraint at the end point of the path. *Return type:* float
`gba_slack`	Returns the original slack time for the timing path – before PBA retiming is performed. *Return type:* float
`gba_slack_mean`	Returns the mean component of the slack time for the timing path – before PBA retiming is performed. *Return type:* float
`gba_slack_sigma`	Returns the sigma component of the slack time for the timing path – before PBA retiming is performed. *Return type:* float
`hold`	Returns the hold time at the end point of the path. *Return type:* float
`is_clock_gating_hold`	Returns a value of `true` if the path is a clock gating hold check. *Return type*: boolean
`is_clock_gating_setup`	Returns a value of `true` if the path is a clock gating setup check. *Return type*: boolean
`is_transparent_latch`	Returns a value of `true` if the path is a transparent latch path. *Return type:* boolean
`launch_clock_path`	Returns the launching clock path of the timing path. This property can be used only for path_type full_clock. *Return type:* collection
`launching_clock`	Returns the launching clock of the timing path. *Return type:* collection
`launching_clock_is_inverted`	Returns a value of true if the phase of the clock at the start point of the launch clock path is opposite to the phase of the launch clock at the source. *Return type:* boolean
`launching_clock_is_propagated`	Returns a value of `true` if the launching clock is in the propagated mode, at the clock end point. *Return type:* boolean
`launching_clock_latency`	Returns the ideal or propagated latency of the launching clock. *Return type:* float

`launching_clock_latency_mean`	Returns mean component of latency of the launching clock. *Return type:* float
`launching_clock_latency_sigma`	Returns sigma component of latency of the launching clock. *Return type:* float
`launching_clock_open_edge_time`	Returns the opening edge time of the launching clock. *Return type:* float
`launching_clock_open_edge_type`	Returns the launching clock's open edge type at the launching point of the timing path. In case of input delay path with respect to a clock it will return the clock edge type, which is triggering the path. *Return type:* string
`launching_clock_source_arrival_time`	Returns the launching clock arrival time at the clock route pin/port of the launching clock path. This value is the sum of the clock edge time plus any source latency constraint specified at the clock root. **Note:** You must specify `report_timing -path_type full_clock` in order to return launching clock arrival time information. *Return type:* float
`launching_clock_source_arrival_time_mean`	Returns the mean component of the launching clock arrival time at the clock route pin/port of the launching clock path.
`launching_clock_source_arrival_time_sigma`	Returns the sigma component of the launching clock arrival time at the clock route pin/port of the launching clock path. *Return type:* float
`launching_input_delay`	Returns the input delay if the timing path starts from an input or output port. This value is set using `set_input_delay`. *Return type:* float
`launching_point`	Returns a pointer to the start point of the timing path. *Return type:* collection
`launching_point_is_level_sensitive`	Returns a value of `true` if the begin point of the data path is level sensitive. *Return type:* boolean
`nets`	Returns the nets for the specified timing paths. For example, `get_property [get_timing_paths] nets` *Return type*: string

`num_cell_arcs`	Returns the number of cell arcs in the given timing path.
	For example,
	`set path [report_timing -from <start_point> -to <end_point> -collection]`
	`get_property $path num_cell_arcs`
	Return Type: float

`num_net_arcs`	Returns the number of net arcs in the given timing path.
	For example,
	`set path [report_timing -from <start_point> -to <end_point> -collection]`
	`get_property $path num_net_arcs`
	Return Type: float

`object_type`	Returns the object type `timing_path`. *Return type:* string
`other_end_arrival`	Returns the capture clock path's begin time, In case of SOCV analysis, mean+N*sigma quantile value is reported. *Return type:* float

`other_end_arrival_mean`	Returns the mean component of capture clock path's begin time. *Return type:* float
`other_end_arrival_sigma`	Returns the sigma component of capture clock path's begin time. *Return type:* float
`path_delay`	Returns the delay of data path component of a timing path. In case of SOCV analysis, mean+N*sigma quantile delay is reported. *Return type:* float
`path_delay_mean`	Returns the mean delay component of data path of a timing path. *Return type:* float
`path_delay_sigma`	Returns the sigma delay component of data path of a timing path. *Return type:* float
`path_group`	Returns a collection of path groups associated with the timing path. *Return type:* collection
`path_group_name`	Returns the name of the path group for the timing path. *Return type:* string
`path_type`	Returns a value of `max` if the path is for setup, or `min` if the path is for hold. *Return type:* string
`period`	Returns the time duration between the launching clock edge and capturing clock edge of the path. The launching clock edge indicates the launching clock time when the signal at the start point of the path is launched, and the capturing clock edge indicates the capturing clock time when the signal at the path end point is captured. For both of these edges, their ideal clock cycle times are considered for calculating the path period. For those paths, where either the launching or capturing clock is absent or asynchronous, the property prints NA. The property works for both setup (late) paths, and hold (early) paths. Usually the path period is decided by a simple subtraction of effective launching edge from the effective capturing edge of the path. Under certain scenario, these edges are moved back or ahead in time, and accordingly the path period is also affected. The following factors impact period: a) Multicycle paths: The launch or capture edge will move by the cycle factor depending on the type of multi cycle exception, and this cycle factor is taken into account while computing the period. b) Max delay paths: Any max_delay specification overrides the relationship between capturing and launching edges and sets it to the max_delay value. The period of the path is thus returned as equal to the specified max delay value for sequential max delay paths. Note that a combinational max delay path has at least one of the launch or capture clocks either absent or asynchronous, and hence the effective period is not calculated for them. c) Clock uncertainty: The uncertainties applicable to the interaction of launch and capture clocks for this particular path also affect the effective edges, but this factor is not taken into consideration while computing the period. d) Unconstrained paths: The unconstrained paths have no capture clock and hence period can not be calculated for them. The property will return NA. *Return value*: float For more information, see "Examples".
`recovery`	Returns the recovery time at the end point of the path. *Return type:* float

`removal`	Returns the removal time at the end point of the path. *Return type:* float
`required_time`	Returns the required time for the timing path. *Return type:* float
`required_time_mean`	Returns the mean component of the required time for the timing path. *Return type:* float
`required_time_sigma`	Returns the sigma component of the required time for the timing path. *Return type:* float
`setup`	Returns the setup time at the end point of the path. *Return type:* float
`skew`	Returns the latency difference between the capturing clock latency and launching clock latency of the path (after considering the effect of CPPR factor). *Return type:* float
`slack`	Returns the slack time for the timing path. *Return type:* float
`slack_mean`	Returns the mean component of the slack time for the timing path. *Return type:* float
`slack_sigma`	Returns the sigma component of the slack time for the timing path. *Return type:* float
`slack_stddev`	Returns standard deviation of the slack. *Return type:* float
`spatial_distance`	Reports the bounding box distance for spatial derating applied on a timing path. *Return type:* float
`time_borrowed`	Returns the amount of time borrowed from the timing end point. *Return type:* float
`time_lent`	Returns the amount of time lent to the timing start point. *Return type:* float
`timing_points`	Returns a collection of the timing points that make up the path. *Return type:* collection
`underated_slack`	Returns the underated slack time for the timing path. The underated slack value is available with timing path object only if it is generated using the `-derate` parameter. *Return type:* float
`view_name`	Returns the analysis view name associated with the timing path. *Return type*: string

Timing Point Properties

`arrival`	Returns the arrival time at the timing point. *Return type*: float
`arrival_mean`	Returns the mean component of the arrival time at the timing point. *Return type*: float
`arrival_sigma`	Returns the sigma component of arrival time at the timing point. *Return type*: float
`delay`	Returns the delay value for the timing point. *Return type:* float
`delay_mean`	Returns the mean component of the delay value for the timing point. *Return type:* float
`delay_sigma`	Returns the sigma component of the delay value for the timing point. *Return type:* float
`delta_delay`	Returns the incremental delay on a timing point after SI analysis is performed. *Return type:* float
`fanin_arc`	Returns the delay arc for the corresponding timing point. *Return type*: collection
`object_type`	Returns the `timing_point` object type. *Return type:* string
`pin`	Returns a collection of pins or ports of the timing point. *Return type:* collection
`si_object`	Returns the `si_victim` object type that can be used to query SI delay attributes. **Note**: To enable SI objects, you can set the `timing_report_enable_si_debug` global variable to `true`.
`slew`	Returns the path-specific slew of the timing point. *Return type:* float
`slew_mean`	Returns the mean component of the path-specific slew of the timing point. *Return type:* float
`slew_sigma`	Returns the sigma component of the path-specific slew of the timing point. *Return type:* float
`transition_type`	Returns the transition type of the timing point - rise or fall. *Return type:* string

Signal Integrity Attributes

The signal integrity attributes can be queried using the following object types:

- `si_victim`
- `si_attacker`
- `noise_victim`: Returns a collection of `si_victim` objects that can be used to query glitch attributes.
  Return type: collection

These are explained below.

si_victim Properties

The following information is saved under the `si_victim` object type:

		Valid for Properties		
Property Name	**Description**	**si_victim**	**si_object**	**noise_victim**
`annotated_glitch`	Reports the annotated glitch. *Return type:* float	N	N	Y
`attackers`	Returns a collection of `si_attacker` objects that can be used to query attacker attributes. *Return type:* collection	Y	Y	Y
`capacitance`	Returns the total capacitance of victim net. *Return type:* float	Y	Y	Y
`coupling_capacitance`	Returns the total coupling capacitance of a victim net. *Return type:* float	Y	Y	Y
`glitch_area`	Returns the glitch area. *Return type:* float	N	N	Y
`glitch_width`	Returns the glitch width. *Return type:* float	N	N	Y
`hierarchical_name`	Returns the hierarchical name of a victim net. *Return type:* string	Y	Y	Y
`input_peak`	Returns the Receiver Input Peak (RIP) value. *Return type:* float	N	N	Y
`input_failure_threshold`	Returns the failure threshold at RIP. This will always be reported irrespective of whether failure happens at RIP or ROP. *Return type:* float	N	N	Y
`level`	Returns the noise level - VL or VH. *Return type:* string	N	N	Y
`num_active_attackers`	Returns the number of active attackers. *Return type:* float	Y	Y	Y
`num_attackers`	Returns the number of total attackers (distinct + accumulated small attacker - as 1). The attackers that are dropped from the accumulated small attackers will not be included with the total attackers. *Return type:* float	Y	Y	Y

`object_type`	Returns the object type `si_victim`. *Return type:* string	Y	Y	Y
`prop_glitch`	Reports the propagated glitch seen at the victim driver output. *Return type:* float	N	N	Y
`receiver_peak`	Returns the Receiver Output Peak (ROP) value. *Return type:* float	N	N	Y
`receiver_peak_threshold`	Returns the failure threshold at ROP. This will always be reported irrespective of whether failure happens at RIP or ROP. *Return type:* float	N	N	Y
`resistance`	Returns the total resistance of a victim net. *Return type:* string	Y	Y	Y
`transition`	Returns the victim transition direction (rise or fall). *Return type:* string	Y	Y	N
`view_type`	Returns the type of analysis (early or late). *Return type:* string	Y	Y	N

si_attacker Properties

The following Information is saved under the `si_attacker` object type for each attacker of the victim net in the path:

Property Name (for each attacker retrieved from a victim)	Description
`coupling_capacitance`	Returns the coupling of a victim net. *Return type:* float
`hierarchical_name`	Returns the hierarchical name of an attacker. *Return type:* string
`is_active`	Returns whether an attacker is active or not. *Return type:* string
`noise_peak`	Returns the Xtalk delay bump induced by an attacker. *Return type:* float
`object_type`	Returns the `si_attacker` object type. *Return type:* string
`slew`	Returns the slew of attackers. *Return type:* float

`state`	Returns the status of attackers. The status descriptions are given below: • SY: Synchronous • INF: Attacker with infinite timing window • PE: Filtered due to physical exclusion • UF: Filtered by user • CN: Filtered because it is a constant net • SB: Filtered due to small bump • TA: Filtered because of timing window does not overlap • LC: Filtered due to logical correlation • NA: Attacker status is not known *Return type:* string

Examples

The following `get_property` example shows the usage of SI attributes to query noise information:

```
source pinlist.tcl
set chan [open attribute.log w]
foreach pin $pinList {
   set vicArray [get_property [get_pins $pin] noise_victim]
   foreach_in_collection vic $vicArray {
       set input_peak [ get_property $vic input_peak]
       #if { $input_peak > 250 } {}

       set vic_name [ get_property $vic hierarchical_name ]
       set x [ get_property [get_net -of_objects $vic_name ] name ]
       set level [ get_property $vic level]
       set ccap [ get_property $vic capacitance]
       set vdd [get_property [get_pins $vic_name] power_rail_voltage_max]
       set libs [get_libs -of_objects [get_lib_cells -of_objects [get_cells -of_objects [get_pins $vic_name]]]]
       foreach_in_collection libName $libs {set library [get_property $libName hierarchical_name]}
       set prop_glitch [ get_property $vic prop_glitch]
       set cap [format %.2f $ccap]
       set annotated_glitch [ get_property $vic annotated_glitch]
       set receiver_peak [ get_property $vic receiver_peak]
       set input_peak_threshold [ get_property $vic input_failure_threshold ]
       set receiver_peak_threshold [ get_property $vic receiver_peak_threshold]
       puts $chan "--------------------------------------------------------------------------------"
         puts $chan "Peak(mV) Level TotalCap(fF) Vdd(V) Library VictimNet"
         puts $chan "$input_peak $level $cap $vdd $library $vic_name {$x}"

         if { $receiver_peak > 0 } {
           puts $chan "Receiver output peak:"
           puts $chan "Value ReceiverNet"
           puts $chan "$receiver_peak ( $receiver_peak_threshold) $vic_name (CELL)"
         }

         if { $input_peak > 0 } {
           puts $chan "Receiver Input peak:"
           puts $chan "Value ReceiverNet"
```

```
      puts $chan "$input_peak ( $input_peak_threshold) $vic_name (CELL)"
    }

      puts $chan "Cpl: $noise_peak $slew $edge $vdd $coupling_capacitance $state $hierarchical_name"
      }
    if { $prop_glitch > 0 } {
      puts $chan "Prp: $prop_glitch"
     }

}
close $chan
```

User-Defined Properties

The user-defined properties allow you to define certain properties which can be interpreted by the software in a predefined way. When these properties are not specified, the software will revert to the default behavior, as applicable.

Property Name	Type	Description
`capacitive_load_unit`	lib	Provides the load unit mentioned in the library.
`time_unit`	lib	Provides the time unit mentioned in the library.
`aocv_weight`	lib_cell	Defines AOCV weight for a given cell.
`k_input_switching_window_fall*`	lib	Defines the switching window threshold for fall signal during the application of SSI (simultaneous switching input) derating feature. *Default*: 1
`k_input_switching_window_rise*`	lib	Defines the switching window threshold for rise signal during the application of SSI (simultaneous switching input) derating feature. *Default*: 1

* When the above properties are defined in SSI derating environment, the delay of the respective cell multiplied by the above factor will be compared with the difference in (rise/fall) signal arrivals at two inputs to determine if switching derate needs to be applied to cell delay.

Examples

- The following command returns the hierarchical name for the pin contained in the collection referenced by `$pin`:
  ```
  get_property $pin hierarchical_name
  ```
- The following example shows how you can query a user-defined property from `stage_weighting` library at the cell level:
  ```
  set_property [get_lib_arcs -of fast/BUFX2] stage_weighting 3 // sets the value
  get_property [get_lib_arcs -of fast/BUFX2] stage_weighting
  ```
- The following example shows power and ground pins for the corresponding library pins:
  ```
  get_property [get_lib_pins CELLA/A] related_power_pin
  get_property [get_lib_pins CELLA/A] related_ground_pin
  ```

- The following example shows active clocks:

```
get_property [get_clocks Iclk1] is_active true
```

- The following commands define the switching window threshold for rise signal:

```
define_property -type float -object_type lib k_input_switching_window_rise
set_property [get_libs slow] k_input_switching_window_rise 1.1
```

- The following example shows that the phase shift is 2.0 ns, as returned by the "period" property:

```
report_timing -clock_to CLK_W_3 -clock_from CLK_W_3

  Path 1: MET Setup Check with Pin seg3/u14/CK
  Endpoint: seg3/u14/D (^) checked with leading edge of 'CLK_W_3'
  Beginpoint: seg3/u9/Q (^) triggered by leading edge of 'CLK_W_3'
  Path Groups: {CLK_W_3}
  Other End Arrival Time 0.621
  - Setup 0.186
  + Phase Shift 2.000
  = Required Time 2.434
  - Arrival Time 2.062
  = Slack Time 0.372
  Clock Rise Edge 0.000
  + Clock Network Latency (Prop) 0.682
  = Beginpoint Arrival Time 0.682
  ……..
  innovus > set path [rt -clock_to CLK_W_3 -clock_from CLK_W_3 -collection]
  0x14
  innovus > get_property $path period
  2.000
```

- In this following example, there is a clock reference for launch clock (Null phase- @), so Innovus does not show any clock period for this path:

```
report_timing -clock_to CLK_W_3 -early

  Path 1: VIOLATED Hold Check with Pin seg3/u3/CK
  Endpoint: seg3/u3/D (v) checked with leading edge of 'CLK_W_3'
  Beginpoint: IN3 (v) triggered by leading edge of '@'
  Path Groups: {CLK_W_3}
  Other End Arrival Time 0.682
  + Hold -0.034
  + Phase Shift 0.000
  = Required Time 0.648
  Arrival Time 0.117
  Slack Time -0.531
  Clock Rise Edge 0.000
  + Input Delay 0.000
  + Drive Adjustment -0.014
  = Beginpoint Arrival Time -0.014
  ---------------------------------------------------------------------------------------

                      Delay   Annotation                             Derate Time
  ---------------------------------------------------------------------------------------
  0.013 0.029                 WLM        1       IN3     v                  -0.014
  0.013 0.057  0.054   0.000  WLM        1       CLKBUF  A v -> Y v  1.000  0.040   seg3/u1
  0.003 0.050  0.077   0.000  WLM        1       CLKBUF  A v -> Y v  1.000  0.117   seg3/u2
  0.003 0.050  0.000   0.000  WLM                DFF     D v         1.000  0.117   seg3/u3
  ---------------------------------------------------------------------------------------

  innovus > set path [report_timing -clock_to CLK_W_3 -collection -early]
  0x16
  innovus > get_property $path period
  NA
```

- The following example shows if a real or generated clock is defined on the pins or ports:

```
tempus > create_clock [get_ports {CLK_t}] -name clk -period 100 -waveform {0 50}
tempus > create_generated_clock -divide_by 2 -source CLK -name d_2 CLK_b
tempus > get_property [get_ports CLK_t] is_clock_root
true

tempus > get_property [get_pins CLK_b] is_clock_root
```

```
true
```

Related Commands

- list_property
- get_clocks
- get_pins
- get_cells
- report_timing

index_collection

```
index_collection
[-help]
base_collection
index
```

Returns a collection containing the object that exists at the specified index of the specified object collection.

Parameters

`-help`	Prints out the command usage.
`base_collection`	Specifies the base collection.
`index`	Specifies the index number. You can specify a number from `0` to *`collection_size-1`*.

Examples

- The following command returns the object that exists at the index number `2` in the object collection referenced by `$nets`:

  ```
  index_collection $nets 2
  ```

Related Information

- `append_to_collection`
- `compare_collections`
- `copy_collection`
- `filter_collection`

list_property

```
list_property
[-help]
[-type {cell clock design lib lib_cell lib_pin lib_timing_arc net path_group pin port timing_arc timing_path timing_point pg_net pg_pin
lib_pg_pin si_victim si_attacker}]
```

Lists all of the properties associated with the specified object type.

If you do not specify any object type, this command lists all the supported object types, and all the properties associated with those object types.

Parameters

`-help`	Prints out the command usage.
`-type` *object_type*	Lists the properties associated with the specified object type. The following object types are supported: cell, clock, design, lib, lib_cell, lib_pg_pin, lib_pin, lib_timing_arc, net, path_group, pg_net, pg_pin, pin, port, si_attacker, si_victim, timing_arc, timing_path, or timing_point Additional SI properties can be included with the `timing_point` object. To enable SI properties, you can set `timing_report_enable_si_debug` global variable to `true`.

Related Commands

- `get_property`
- `report_property`
- `reset_property`
- `set_property`

query_objects

```
query_objects
[-help]
collection
[-limit value]
```

Displays the names of the objects contained inside the specified collection.

⚠ `query_objects` displays object names only. To return a tcl list of object names, the `get_object_name` command may be used instead.

Parameters

`-help`	Prints out the command usage.
`collection`	Specifies the object collection for which to print names.
`-limit` *`value`*	Specifies the maximum number of object names to print. Specify a value of `0` to query the names of all of the objects in the collection. *Default*: Prints the first 100 object names in the collection.

Examples

- The following commands create collections of pins and nets, add them together to create a new collection, and prints the names of the objects in the collection:

  ```
  set pins [get_pins {i_block1/b1_Sin1 i_block1/b1_CLK1 i_block1/b1_Sout1}]
  set nets [get_nets {Sin1 CLK1 Sout1}]
  add_to_collection newVar $pins
  add_to_collection newVar $cells
  query_objects $newVar
  ```

  The software returns the following information:

  ```
  i_block1/b1_Sin1 i_block1/b1_CLK1 i_block1/b1_Sout1 Sin1 CLK1 Sout1
  ```

Related Information

- `get_object_name`

range_collection

```
range_collection
[-help]
base_collection
from
to
```

Returns a sub-collection of the base collection. The sub-collection range lies between the ‘from’ and ‘to’ (including ‘from’ and ‘to’) index numbers specification of this command.

Parameters

`-help`	Prints out the command usage.
base_collection	Specifies the base collection.
from	Specifies the ‘from’ index number.
to	Specifies the ‘to’ index number.

The index number can be an integer or an expression, such as, “end OR end-integer” (with no spaces within the expression).

If the specified to/from value is negative (less than 0), then the software will change this value to 0. If the value is greater than the “collection_size – 1”, then it will be changed to “collection_size – 1”.

Examples

- The following example sets `$points` as the base collection:

```
> set points [get_cells *]
0x13
> sizeof_collection $points
22
```

- The following example returns the sub-collection of the base collection `$points` between the index number range from 2 to 4:

```
> range_collection $points 2 4
clk_buf2 clk_buf3 clk_buf4
0x16
> range_collection $points 4 2
clk_buf2 clk_buf3 clk_buf4
0x17
```

- The following example returns a sub-collection starting from index number 0 till the end of the base collection:

```
> range_collection $points 0 end
clk_buf1 pad1 clk_buf2 clk_buf3 clk_buf4 buf1 buf2 buf3 buf4 mem dff1 dff2 clkand2 pu_cell_1 pu_lat_1 u1 cg4 genLoop comboLoop pad2
dff3 latch1
0x18
```

- The following example returns a sub-collection starting from end-integers 4 to 2:

```
> range_collection $points end-4 end-2
genLoop comboLoop pad2
0x19
```

- The following example shows a range starting from a negative value to a value greater than the collection size. The following warning messages are displayed:

```
> range_collection $points -5 100
**WARN: (TCLCMD-1419): 'from' index with value -5 is less than start index, so it is changed to 0 .
**WARN: (TCLCMD-1419): 'to' index with value 100 is greater than end index, so it is changed to 21 .
clk_buf1 pad1 clk_buf2 clk_buf3 clk_buf4 buf1 buf2 buf3 buf4 mem dff1 dff2 clkand2 pu_cell_1 pu_lat_1 u1 cg4 genLoop comboLoop pad2
dff3 latch1
0x1a
```

- The following example shows the warning message displayed for a negative start index number:

```
> range_collection $points end-25 end-20
**WARN: (TCLCMD-1419): 'from' index with value -4 is less than start index, so it is changed to 0 .
clk_buf1 pad1
0x1b
```

- The following command shows an error if the specified index number is not an integer:

```
> range_collection $points s end
**ERROR: (TCLCMD-1418): Bad index 's': must be integer? or end?[-]integer?
```

Related Commands

- index_collection

remove_from_collection

```
remove_from_collection
[-help]
base_collection
[-intersect]
object_collection_or_list
```

Creates a new collection by removing the objects specified in one collection from another collection.

Parameters

`-help`	Prints out the command usage.
`base_collection`	Specifies the base collection of objects. Objects from the second collection or object list are removed from this collection to create the new collection.
`-intersect`	Provides intersection of base collection elements with second collection of objects or lists.
`object_collection_or_list`	Specifies the collection or list of objects that should be removed from the base collection to create the new collection.

Examples

- The following commands create a collection of pins that does not include clock pins:

  ```
  set allP [get_pins *]
  set all_pin_no_clock [remove_from_collection $allP [get_pins -filter "is_clock == true"]]
  ```

  You can use the `sizeof_collection` command to see that the `all_pin_no_clock` collection contains fewer objects (that is, no clock pins) than the original `allP` collection:

  ```
  sizeof_collection $allP
  50

  sizeof_collection $all_pin_no_clock
  47
  ```

Related Information

- `add_to_collection`
- `append_to_collection`
- `compare_collections`
- `copy_collection`
- `filter_collection`

report_property

```
report_property
[-help]
{collection | list_of_collections}
[-property_list list of properties]
[{> | >>} filename]
```

Reports the properties associated with each object in the specified collection.

For properties that return a populated collection, the command output displays `{...}`. For any empty collections,`{}` will be displayed.

Parameters

`-help`	Prints out the command usage.
*collection	list_of_collections*	Specifies a collection, or a list of collections to report. The collections can contain any of the following object types: cell, clock, design, lib, lib_cell, lib_pin, lib_pg_pin, pg_net, pg_pin, lib_timing_arc, net, path_group, pin, port, timing_arc, timing_path, or timing_point
`-property_list` *list of properties*	Specifies a list of valid property names to report. **Note**: If the `-property_list` parameter is not specified, then all the properties associated with a collection of objects will be reported.
{> | >>} *filename*	When specified with >, the software writes the report to the specified file name. If the file already exists, the software overwrites it. When specified with >>, the software writes the report to the specified file name. If the file already exists, the software concatenates the report to the end of the file. You can add the `.gz` extension to the file name to generate a compressed report. **Note:** The file name must be the last argument in the list.

Examples

- The following command shows the values of the specified properties:

```
report_property [get_pins TU11/A] -property_list {name direction clocks}

property | value
name | TU11/A
direction | in
clocks | {...}
```

Related Commands

- get_property
- define_property
- list_property
- set_property
- reset_property

sizeof_collection

```
sizeof_collection
[-help]
collection
```

Returns the total number of objects contained in the specified collection. If the collection contains different types of objects, `sizeof_collection` returns the sum of all the objects of different types in the collection.

Parameters

`-help`	Prints out the command usage.
`collection`	Specifies the collection.

Related Information

- `add_to_collection`
- `append_to_collection`
- `compare_collections`
- `copy_collection`
- `filter_collection`

sort_collection

```
sort_collection
[-help]
collection
[-dictionary]
{property_or_list_of_properties}
[-descending]
```

Returns a sorted collection of objects based on the property.

Parameters

`-help`	Prints out the command usage.
collection	Specifies the collection to sort. The collection must be a homogenous collection of any one of the following object types: `cell`, `clock`, `design`, `lib`, `lib_cell`, `lib_pin`, `lib_timing_arc`, `net`, `path_group`, `pin`, `port`, `timing_arc`, `timing_path`, or `timing_point`.
`-descending`	Sorts the objects in the collection by descending order. *Default:* Sorts the collection in ascending order.
`-dictionary`	Sorts the objects in a collection by dictionary order.
property | *list_of_properties*	Sorts the collection by the specified property. You can specify any property associated with the object type. You can specify one or more properties. If you specify more than one property, the software sorts the collection in the order by which you specified the properties.

Examples

- The following command returns a collection of all the input ports in the design sorted on the basis of their hierarchical names:

```
sort_collection [all_inputs] hierarchical_name

CLK1 CLK2 CLK3 CLK4 IN1 IN2 IN3 IN4
```

- `filter_collection`

2

ART Based Flow Commands

- clearActiveLogicView
- createActiveLogicView
- getActiveLogicViewMode
- getHierMode
- getModuleView
- setActiveLogicViewMode
- setHierMode
- setModuleView

clearActiveLogicView

```
clearActiveLogicView
[-help]
```

Resets the reduced timing graph created by `createActiveLogicView` back to the original timing graph.

Parameters

`-help`	Outputs a brief description of the `clearActiveLogicView` command. For a detailed description of the command, use the `man` command: `man clearActiveLogicView`

Related Topics

- `createActiveLogicView`
- Timing Analysis chapter of the *Innovus User Guide*
- Top-level Timing Closure Methodologies chapter of the *Innovus User Guide*

createActiveLogicView

```
createActiveLogicView
[help]
[-type {flatTop timingBudget topIO}[-setDontTouch | -unsetDontTouch ]]
```

Trims the timing graph to ignore logic inside the first level registers in partitions to improve runtime for timing-related commands. This capability should only be used for timing analysis purpose.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `createActiveLogicView` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man createActiveLogicView`.
`-setDontTouch`	Sets the dontTouch value as `true`. This freezes I/O interfaces (Interface logics and interface nets) and prevents the `optDesign -postCTS -hold` from optimizing the block interface logics. The ILM ECO data can be loaded back.
`-type {flatTop timingBudget topIO}`	Specifies the Active Logic View type. • `flatTop`: Used to mark the top-level timing graph to mask all logic inside the interface logic of each partition. • `timingBudget`: Instructs the command to use tuned settings for `deriveTimingBudget` when marking the top-level timing graph. This option should be specified if you plan to run `timeDesign` or `optVirtual` with ART based and later on run `deriveTimingBudget` based on the resulted timing graph. • `topIO`: Marks interface nets/instances to don't touch, so optimizer will preserve the I/O paths during optimization. Value of `-topIO` is `-setDontTouch` or `-unsetDontTouch`.
`-unsetDontTouch`	Sets dontTouch value as `false`. This resets the dontTouch on I/O logics before reading the ECO data.

Related Information

- `clearActiveLogicView`
- `timeDesign`

getActiveLogicViewMode

```
getActiveLogicViewMode
[-help]
[-keepAsync {false | true}]
[-keepHighFanoutPorts {true| false}]
[-keepInstInSdc {true|false}]
[-keepLoopBack {false | true}]
[-quiet]
[-nonDefault]
```

Controls certain behaviors of active logic view commands.

Use the `getActiveLogicViewMode` command to display the current settings for the `setActiveLogicViewMode` command.

Parameters

`-keepAsync {false | true}`	Discards or retains the portion of the netlist relating to asynchronous control and scan controls terminals. By default, the tool discards this portion of the netlist. This option potentially conflicts the setting of `setAnalysisMode -async true` when the analysis for an asynchronous circuit is desired. When this happens, a warning message is issued. *Default:* `false`
`-keepHighFanoutPorts {true | false}`	Retains or discards the portion of the netlist relating to high-fanout ports. By default, the tool retains this portion of the netlist. *Default:* `true`
`-keepInstInSdc {true|false}`	Keeps instances which have constraints on it. *Default:* `false`
`-keepLoopBack {false | true}`	Discards or retains the portion of the netlist relating to input and output loopback paths. By default, the tool discards this portion of the netlist. *Default:* `false`
`-help`	Outputs a brief description that includes type and default information for each `getActiveLogicViewMode` parameter. For a detailed description of the command and all of its parameters, use the man command: `man getActiveLogicViewMode`
`-nonDefault`	Displays the current settings which are not default settings.
`-quiet`	Displays the current settings for the specified parameters in the Tcl list format. If you specify `-quiet` without any parameters, the software displays the current settings of all the `getActiveLogicViewMode` parameters in the Tcl format.

Example

- The following command displays the current setting for the `highFanoutPort` parameter in the Tcl list format:

  ```
  getActiveLogicViewMode -keepHighFanoutPorts -quiet
  ```

  The software displays the following information:

  ```
  true
  ```

- The following command displays the current setting for the `getActiveLogicViewMode` parameter:

  ```
  getActiveLogicViewMode
  ```

  The software displays the following information:

  ```
  -keepAsync false                    #bool, default=false
  -keepHighFanoutPorts true           #bool, default=true
  -keepLoopBack false                #bool, default=false

  {keepAsync false}  {keepHighFanoutPorts true}   {keepLoopBack false}
  ```

- The following command displays the current settings for all the `getActiveLogicViewMode` commands in the Tcl list format only:

  ```
  getActiveLogicViewMode -quiet
  ```

  The software displays the following information:

  ```
  {keepAsync false} {keepHighFanoutPorts true} {keepLoopBack false}
  ```

Related Topics

- `setActiveLogicViewMode`

getHierMode

```
getHierMode
[-help]
[-addAntennaCell]
[-quiet]
[-trialRouteHonorReadOnly]
[-optStage {preCTS | postCTS | unset}]
```

Returns information about the specified `setHierMode` parameter in the log file and in the console. The following information is returned:

- Parameter name
- Current value
- Type (Boolean, string, and so on)
- Whether the current value was set by user

If you do not specify a parameter, the Innovus software returns values for all of the `setHierMode` parameters.

Parameters

parameter_names	Returns information for the specified parameter. You can specify one or more parameters. See `setHierMode` for descriptions of the parameters you can specify.
`-quiet`	Returns the current settings for the specified parameters in Tcl list format only. If you specify `-quiet` without any parameters, the software returns the current settings of all `setHierMode` parameters in Tcl list format.

Examples

- The following command returns the current settings for all `setHierMode` parameters:

  ```
  getHierMode
  ```

  The software returns the following information:

  ```
  -addAntennaCell                         # bool, default=false

  {addAntennaCell false}
  ```

- The following command returns the current settings for all `setHierMode` parameters in Tcl list format only:

  ```
  getHierMode -quiet
  ```

  The software returns the following information:

  ```
  {addAntennaCell false}
  ```

Related Topics

- `setHierMode`

getModuleView

```
getModuleView
[-help]
[-topReadOnly]
[-hinst list_of_partition_hinsts]
[-partition list_of_paritions]
[-quiet]
```

Verifies the FlexView mode.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `getModuleView` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man getModuleView`
`-hinst` *`list_of_partition_hinsts`*	Displays the list of partition hinsts.
`-partition` *`list_of_paritions`*	Displays the list of partitions.
`-quiet`	Displays the current settings for the specified parameters in Tcl list format only. If you specify `-quiet` without any parameters, the software displays the current settings of all `setModuleView` parameters in Tcl list format.
`-topReadOnly`	Displays if the top level is read only.

Examples

- The following command verifies the FlexView mode:

```
getModuleView

{TOP all}
{coreinst/ks_core1/amba_dsp1/ram2p_78kx32 readOnly}
{coreinst/ks_core1/leon1 interface}
```

Related Topic

- setModuleView

setActiveLogicViewMode

```
setActiveLogicViewMode
[-help]
[-reset]
[-keepAsync {false | true}]
[-keepHighFanoutPorts {true| false}]
[-keepInstInSdc {true|false}]
[-keepLoopBack {false | true}]
```

Controls certain behaviors of active logic view commands.

Use the `setActiveLogicViewMode` command to display the current settings for the `createActiveLogicView` command.

Parameters

`-keepAsync {false | true}`	
	Discards or retains the portion of the netlist relating to asynchronous control and scan controls terminals. By default, the tool discards this portion of the netlist. This option potentially conflicts the setting of `setAnalysisMode -asyncChecks async` when the analysis for an asynchronous circuit is desired. When this happens, a warning message is issued. *Default:* `false`
`-keepHighFanoutPorts {true | false}`	
	Retains or discards the portion of the netlist relating to high-fanout ports. By default, the tool retains this portion of the netlist. *Default:* `true`
`-keepInstInSdc {true|false}`	Keeps instances which have constraints on it. *Default:* `false`
`-help`	Outputs a brief description that includes type and default information for each `setActiveLogicViewMode` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setActiveLogicViewMode`
`-keepLoopBack {false | true}`	
	Discards or retains the portion of the netlist relating to input and output loopback paths. By default, the tool discards this portion of the netlist. *Default:* `false`
`-reset`	Resets the active logic view mode command parameters to their default values. Any values that do not already match the default value and are reset will be reported.

Example

The following command resets all the `setActiveLogicViewMode` parameters to their default values:

```
setActiveLogicViewMode -reset
```

Related Topics

- `createActiveLogicView`
- `getActiveLogicViewMode`

setHierMode

```
setHierMode
[-help]
[-reset]
[-addAntennaCell {true | false}]
[-optStage {preCTS | postCTS | unset}]
```

Sets global parameters for hierarchy aware optimization. Parameters that are specified with `setHierMode` are used automatically when optimization is invoked by `optDesign` command.

To see the current settings for the `setHierMode` command, see `getHierMode`.

Parameters

`-addAntennaCell {true | false}`	Adds antenna cells to the interface nets crossing partition boundaries. The antenna violations could not be created due to the partition boundary nets. These violations are seen only when the full design is assembled. Therefore, when this parameter is set to `true`, it will add antenna cells to fix these violations. *Default*: `false`
`-help`	Outputs a brief description that includes type and default information for each `setHierMode` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setHierMode`.
`-reset`	Resets parameters to their default values. The `-reset` parameter *must* be the first parameter specified. If you specify `-reset` by itself, the software resets all `setHierMode` parameters to their default values. Any values that do not already match the default value and are reset will be reported.
`-optStage {preCTS | postCTS | unset}`	Ensures proper settings are turned on for corresponding `optDesign` stages. `-optStage` should be set before `optDesign`, and in cases where module view types are defined, `-optStage` should be defined after module view types for all partitions (including FlexILMs) are defined. For example, `setHierMode -optStage preCTS` ensures that `optDesign -preCTS` honors fence, keep partition boundary port, etc.

Examples

- The following example adds antenna cells to the top/partition boundary nets incase antenna violations are created:

  ```
  setHierMode -addAntennaCell true
  ```

setModuleView

```
setModuleView
[-help]
[-topReadOnly {true | false}]
[-hinst {list_of_partition_hinsts}]
[-partition {list_of_paritions}]
[-type {readOnly|interface|all}]
```

Specifies the FlexView (`readOnly|interface|all`) for the top level and each of the partitions. This way optimization can be limited to the selected sections of the partitions and the top-level logic.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setModuleView` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setModuleView`.
`-topReadOnly {true | false}`	Sets the top level to the read-only mode. By default, optimization can change the logic at the top level to improve timing. By setting this option to `true`, no change will be done to the entire top-level logic. *Default*: `false`
`-hinst` *`list_of_partition_hinsts`*	Applies the selected FlexView mode to the instance name or list of instance names of partitions.
`-partition` *`list_of_partitions`*	Applies the selected FlexView mode to a partition or list of partitions. You have a choice to either specify the instance name of the partition or just the partition itself.
`-type {readOnly|interface|all}`	Specifies the FlexView mode for the specified partition(s). • `readOnly` : Specifies that the optimization will not be performed inside the partition. • `interface`: Specifies that optimization will be restricted only to the interface logic of the partition. • `all` : Specifies that optimization will be done for the entire partition.

add_cell_obs

```
add_cell_obs
[-help]
-cell cell_name_or_pointer
[-exceptPGNet]
-layer layer_name_or_pointer
[-mask int_value]
{-rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}...} | -polygon {x1 y1 x2 y2 x3 y3 ...}}
[-spacing value | -design_rule_width value]
```

Adds obstruction to a cell. The added obs is saved in the database by its own. You do not need to resource it after restoring the database. It adds an obstruction geometry to a cell on the specified layer and is helpful when you want to add a temporary cell obstruction without changing the cell's LEF and reloading Innovus.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `add_cell_obs` parameter. For a detailed description of the command and all its parameters, use the man command: `man add_cell_obs`
`-cell cell_name_or_pointer`	Specifies the cell name or pointer.
`-design_rule_width value`	Specifies the design rule width.
`-exceptPGNet`	Ignores the Power/Ground routing while checking for DRC violations (including shorts) involving the added obs. This paramete
`-layer layer_name_or_pointer`	Specifies the layer name or pointer.
`-mask int_value`	Specifies the integer value of the mask (within the mask range) for the created OBS. *Default:* `0`, which means that the mask is uncolored.
`-polygon {x1 y1 x2 y2 x3 y3 ...}`	Specifies the polygon shape.
`-rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}...}`	Specifies the Obs rect list for adding obstruction geometries.
`-spacing value`	Specifies the spacing value.

`delete_cell_obs`

add_line_end_track

```
add_line_end_track
[-help]
[-eol_width float]
[-except_eol_spacing float [-within float]]
-layer string
-offset float
[-track_distance float]
[-track_pitch float]
```

Creates a line-end track.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `add_line_end_track` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man add_line_end_track`
`-eol_width float`	Specifies the width of the line-end track.
`-except_eol_spacing float`	Specifies the spacing of the line-end track.
`-layer string`	Specifies the layer on which the track is to be created.
`-offset float`	Specifies the offset to the core boundary.
`-track_distance float`	Specifies the distance between two sets of tracks.
`-track_pitch float`	Specifies the track pitch.
`-within float`	Specifies the extension in the orthogonal direction to find a neighbor wire.

add_via

```
add_via
[-help]
[-net net]
-pt {x y}
[-shape {blockring |
blockagewire | blockwire | corewire | drcfill | fillopc | fillwire | followpin | iowire | none | padring | ring | stripe}]
[-shield_net net]
[-status {routed | fixed | cover | shield}]
[-user_class value]
-via via_def
```

Adds a new special-route via instance to the design. A DB pointer is returned to the via, if successful. You can use the command at any point in the design flow. To add regular route via, see `editAddVia`.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `add_via` parameter. For a detailed description of the command and all of parameters, use the man command: `man add_via`
`-net net`	Specifies the name or pointer of the net to associate with the via instance. If not specified, the via is assigned as a floating fillwire via, unless `-shape` is specified.
`-pt {x y}`	Specify the placement location (in microns) of the via instance.
`-shape {blockring | blockagewire | blockwire | corewire | drcfill | fillopc | fillwire | followpin | iowire | none | padring | ring | stripe}`	
	Specifies the special route shape (`DEF SPECIALNETS wiring+ SHAPE`). If `-net` is specified, the default shape is `none`. If `-net` is not specified, the default shape is `fillwire`.
`-shield_net net`	Specifies the name or pointer of the net to be shielded by the via instance. Only valid when `-status` is set to shield.
`-status {routed | fixed | cover | shield}`	
	Specifies the special route (`DEF SPECIALNETS`) wiring status. *Default*: `routed`
`-user_class value`	Specifies the user-defined string to be added to the via instance that is created.
`-via via_def`	Specify the via-master name or pointer of the via-master to place.

Examples

- The following command adds a via with via-master name of `my_via1`:
  ```
  add_via -via my_via1 -pt {100.1 200.5} -net VSS -shape followpin
  ```
- The following command adds a VSS via (`via cell VIA2X`) that shields reset net:
  ```
  add_via -via VIA2X -pt {13.0 145.5} -net VSS -shield_net reset -status shield
  ```
- To add a parameterized via you can look up the via-master with `add_via_definition` (in this case a 1x2 cut via with all the other parameters the default value).
  It will either return an existing via-master with the same parameters, or create it. Then use it to create an instance of the via.
  ```
  set myvia [add_via_definition -via_rule via1_rule -row_col {1 2}]
  add_via -via $myvia -pt {10.5 10.5} -net VS
  ```

add_via_definition

```
add_via_definition
[-help]
[-bottom_layer_masks int+]
[-cut_masks int+]
[-name viaName]
{{-via_rule via_def_rule
    [[-cut_size {x y}][-cut_spacing {x y}][-top_enclosure {x y}]
     [-bottom_enclosure {x y}][-top_offset {x y}][-bottom_offset {x y}][-row_col {x y}]
     [-origin {x y}] [-pattern pattern]]} |
 {{-cut_layer layer -cut_rects {{x1 y1 x2 y2} {x3 y3 x4 y4} ...}
  {[-top_layer layer] {-top_rects {{x1 y1 x2 y2} {x3 y3 x4 y4} ...} |
   -top_polygon {{x1 y1}{x2 y2}...}}}
  {[-bottom_layer layer] {-bottom_rects {{x1 y1 x2 y2} {x3 y3 x4 y4} ...} |
   -bottom_polygon {{x1 y1} {x2 y2}...}}}}}
[-top_layer_masks int+]
```

Creates a via definition (master) from the specified parameters or list of shapes. The via masters created are design (DEF) vias and are for use in DEF SPECIALNETS wiring, unless the modify_ndr command is used to add them the list of valid vias for a NONDEFAULTRULE.

There are two types of via-master definitions:

- Parameterized vias that require a `-via_rule name`, and a set of row, column, spacing and enclosure parameters. These are equivalent to LEF/DEF VIAs defined with VIARULE GENERATE or OpenAccess standardViaDef. Applications normally check the via parameters for comparing and finding via-masters. But for LEF/DEF and reporting purposes, the via-master name is automatically generated using the `-via_rule name` as a prefix with a "_1", "_2", etc. suffix added to make it unique so it will not collide with any existing via-master names. The auto-generated name is only valid during the current session, and may be different after save/restore and opening it in another session. If a via-master already exists with the same parameters, the existing via-master is returned instead of creating a redundant via-master. Hence, this command can also be used to "lookup" any equivalent via-master previously created.
- Fixed vias that require a `-name` and a list of rectangles and polygons. These are equivalent to LEF/DEF VIAs using the RECT and POLYGON statements, or OpenAccess customViaDefs. The via name is the only way to lookup the via-master, and must be unique. The name cannot collide with an existing via-master. These types of via-masters are normally not recommended for design specific or DEF vias, because other blocks may create via-master names that collide. These types of vias are normally only in the library (LEF or OA techfile) so they are shared with all block of the same chip.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `add_via_definition` parameter. For a detailed description of the command and all its parameters, use the man command: `man add_via_definition`
`-bottom_enclosure {x y}`	Specifies the bottom layer enclosure around the cut array. The enclosure measures the distance from the cut-array-edge to the metal-edge that encloses the cut-array. Values are specified in microns. Requires `-via_rule` option for a parameterized via. *Default:* Derived from `-via_rule`.
`-bottom_layer layer`	If not specified, the first layer below the `-cut_layer` is assumed. Requires `-name` option for a fixed via.
`-bottom_layer_masks int+`	Specifies the masks for the `rects` on the bottom layer for a `via_def`. The mask values and `rects` must be in the same order and there must be the same number of mask values as `rects`.
`-bottom_offset {x y}`	Specifies the `x,y` offset for bottom layer in the via. After the "non-shifted via" is computed, the bottom layer rectangle is offset by adding the x,y to the `-origin` offset. Values are specified in microns. Requires `-via_rule` option for a parameterized via. *Default*: {0 0}.
`-bottom_polygon {{x1 y1} {x2 y2}...}`	
	Specifies the polygon to create on the bottom layer. Values are specified in microns. Requires `-name` option for a fixed via.
`-bottom_rects {{x1 y1 x2 y2} {x3 y3 x4 y4} ...}`	Specifies the list of rectangles to create on the bottom layer. Values are specified in microns. Requires `-name` option for a fixed via.

`-cut_layer layer`	Specifies the name or pointer of the cut layer. The top/bottom layers of the via are derived from the routing layers above/below the cut layer. Requires `-name` option for a fixed via.
`-cut_masks int+`	Specifies the masks for the `rects` on the cut layer for a `via_def`. The mask values and `rects` must be in the same order and there must be the same number of mask values as `rects`.
`-cut_rects {{x1 y1 x2 y2} {x3 y3 x4 y4} ...}`	Specifies the list of rectangles to create on the cut layer. Values are specified in microns. Requires `-name` option for a fixed via.
`-cut_size {x y}`	Specifies the size (x=width, y=height) of the cut rectangles. Values are specified in microns and must be greater than 0. Requires `-via_rule` option for a parameterized via. *Default*: Derived from `-via_rule`.
`-cut_spacing {x y}`	Specifies the spacing between the cuts. The spacing is measured from cut-edge to the next cut-edge. Values are specified in microns and must be greater than 0. Requires `-via_rule` option. *Default*: Derived from `-via_rule`.
`-name viaName`	Specifies the name of via to create. For parameterized via definition creation, a new via name is derived from the `-via_rule` name unless `-name` is specified. The name cannot collide with any existing via-master names.
`-origin {x y}`	Specifies the x,y offset for all shapes in the via. By default the 0,0 origin of the via is the center of the cut-array and the center of the enclosing metal rectangles. After the “non-shifted via” is computed, all the cut and metal rectangles are offset by adding these values. size (x=width, y=height) of the cut rectangles. Values are specified in microns. Requires `-via_rule` option for a parameterized via. *Default*: {0 0}.
`-pattern pattern`	Specifies the cut pattern encoded as an ASCII string. This parameter is only required when some of the cuts are missing from the array of cuts. Requires `-via_rule` option for a parameterized via.
`-row_col {x y}`	Specifies the number of cut rows and columns to create. Values must be greater than 0. Requires `-via_rule` option for a parameterized via. *Default*: {1 1}.
`-top_enclosure {x y}`	Specifies the top layer enclosure around the cut array. The enclosure measures the distance from the cut-array-edge to the metal-edge that encloses the cut-array. Values are specified in microns. Requires `-via_rule` option for a parameterized via. *Default*: Derived from `-via_rule`.
`-top_layer layer`	If not specified the first layer above the `-cut_layer` is assumed. Requires `-name` option for a fixed via.
`-top_layer_masks int+`	Specifies the masks for the `rects` on the top layer for a `via_def`. The mask values and `rects` must be in the same order and there must be the same number of mask values as `rects`.
`-top_offset {x y}`	The x,y offset for top layer in the via. After the “non-shifted via” is computed, the top layer rectangle is offset by adding the x,y to the `-origin` offset. Values are specified in microns. Requires `-via_rule` option for a parameterized via. *Default*: {0 0}.
`-top_polygon {{x1 y1}{x2 y2}...}`	Specifies the polygon to create on the top layer. Values are specified in microns. Requires `-name` option for a fixed via.
`-top_rects {{x1 y1 x2 y2} {x3 y3 x4 y4} ...}`	Specifies the list of rectangles to create on the top layer. Values are specified in microns. Requires `-name` option for a fixed via.
`-via_rule via_def_rule`	Specifies the name or pointer of the via-rule (from LEF VIARULE GENERATE or OpenAccess standardViaDef) to use for the via master being created. Layers and default values are derived from the specified `via_rule`. When using `-via_rule`, a parameterized via master is created.

Examples

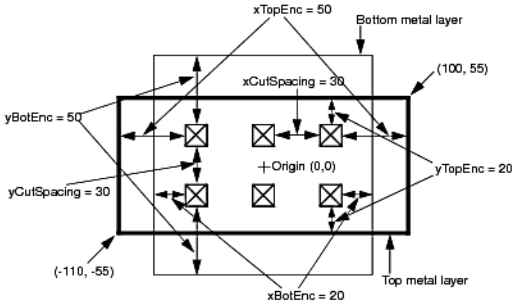
Example 1

Create a 1x2 cut via with default parameters.

```
set myvia [add_via_definition -via_rule via1_rule -row_col {1 2}]
dbGet $myvia.name #returns the via-master name
```

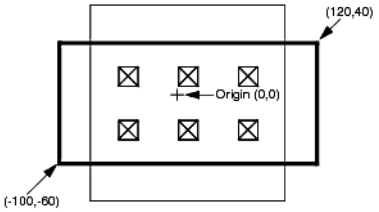
The following parameterized via-master describes a non-shifted via with two rows and three columns of via cuts.
In this example, all the size, spacing, and enclosure rules are given explicitly. In typical usage, they would not be specified and would use the default values in the via-rule.

```
add_via_definition -via_rule via1_rule -row_col {2 3} -cut_size {20 20} \
-cut_spacing {30 30} -bottom_enclosure {20 50} -top_enclosure {50 20}
```



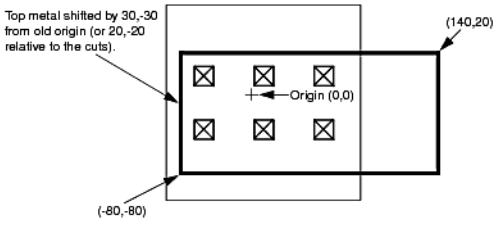
The same via rule with the –origin shifts all of the metal and cut rectangles by 10 in the x direction, and by -10 in the y direction.

```
add_via_definition -via_rule via1_rule -row_col {2 3} -cut_size {20 20} \
-cut_spacing {30 30} -bottom_enclosure {20 50} -top_enclosure {50 20} \
-origin (10 -10)
```



If the same via contains the following –origin and –top_offset parameters, all of the rectangles shift by 10, -10.
In addition, the top layer metal rectangle shifts by 20, -20, which means that the top metal shifts by a total of 30, -30.

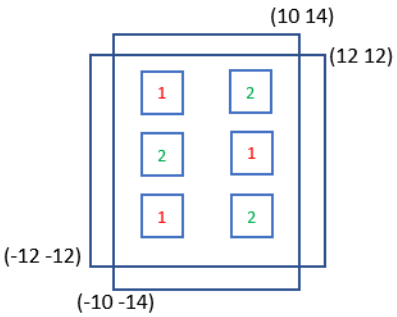
```
add_via_definition -via_rule via1_rule -row_col {2 3} -cut_size {20 20} \
-cut_spacing {30 30} -bottom_enclosure {20 50} -top_enclosure {50 20} \
-origin (10 -10) -top_offset {20 -20}
```



Example 2

The following command adds a `3x2` fixed via to the cut layer mask pattern `{1 2 1 2 1 2}`:

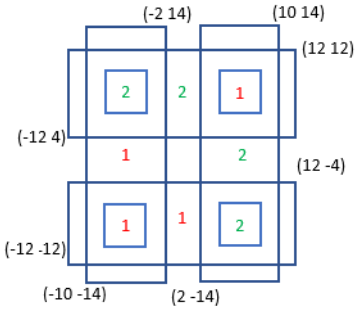
```
add_via_definition  -name my_fixed_via -cut_layer VIA23 \
-bottom_rects {{-10 -14 10 14}} \
-cut_rects {{-6 -10 -2 -6} {-6 -2 -2 2} {-6 6 -2 10} {2 -10 6 -6} {2 -2 6 2} {2 6 6 10}} \
-top_rects {{-12 -12 12 12}} \
-cut_masks {1 2 1 2 1 2}
```



Example 3

The following command adds a `2x2` fixed via to the bottom and top layer mask pattern `{1 2}` and cut layer mask pattern `{1 2 1 2}`:

```
add_via_definition -name my_fixed_via2 -cut_layer VIA23 \
-bottom_rects {{-10 -14 -2 14} {2 -14 10 14}} \
-cut_rects{{-8 -10 -4 -6} {-8 6 -4 10} {4 -10 8 -6} {4 6 8 10}} \
-top_rects {{-12 -12 12 -4} {-12 4 12 12}} \
-bottom_layer_masks {1 2} \
-top_layer_masks {1 2} \
-cut_masks {1 2 1 2}
```



applyGlobalNets

```
applyGlobalNets
[-help]
```

Applies or restores the global net connectivity rules to the design and creates the necessary connections between instances and these global nets.

Parameters

`-help`	Prints a brief description of the `applyGlobalNets` command usage. For a detailed description of the command, use the `man` command: `man applyGlobalNets`

Related Topics

Power Planning and Routing chapter in the *Innovus User Guide.*

clearGlobalNets

```
clearGlobalNets [-help]
```

Resets the logical power net connection. It also clears all the tie-high and tie-low nets logical power net connection.

Parameters

`-help`	Prints a brief description of the `clearGlobalNets` command usage. For a detailed description of the command, use the `man` command: `man clearGlobalNets`

Examples

If the logical connectivity of a `VDD` pin is set with `VDD!` power nets, `VSS` pin with `VSS!` and so on using the globalNetConnect command, the clearGlobalNets command will clear or undo all this logical power nets connectivity. Refer to the commands below:

```
globalNetConnect VDD! -pin VDD -override
globalNetConnect VSS! -pin VSS -override
clearGlobalNets
```

Related Topics

compress_special

```
compress_special
[-help]
[-area {x1 y1 x2 y2}]
[-incremental]
[-layers layer+]
[-nets net+]
```

Compresses Power-Grid (PG) based on the specified area, layer, or net.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `compress_special` parameter. For a detailed description of the command and all its parameters, use the man command: `man compress_special`
`-area {x1 y1 x2 y2}`	Specifies the coordinates for the area from which PG needs to be compressed. The `compress_special` command compresses only those special wires and special vias, which exist within the area specified by this parameter. *Default*: All PG structures are compressed.
`-incremental`	Recompresses the PG after editing the PG wires or vias. This parameter can only be specified when the current design is in compressed mode.
`-layers layer+`	Specifies the layers on which PG compression is needed. This parameter requires either LEF layer names or a routing layer index value (for example, `1` for the first routing layer, `2` for the second routing layer, and so on).
`-nets net+`	Specifies the nets from which PG compression is needed. If the specified net does not have any special route on it, it is ignored.

Example

The following command compresses `%s special_wires` and `%s special_vias`:

```
compress_special -area {100 100 120 120} -net VDD -incremental
```

Related Topics

`decompress_special`

create_virtual_shape_on_pg_wires

```
create_virtual_shape_on_pg_wires
[-help]
-layers {{virtual_layer, power_layer [mask_num]} ...}
[-name string]
[-pg_width_list {list_of_supported_width_values} | -pg_width_range {min_width max_width}]
```

Generates additional virtual shapes and creates markers on PG wires, when the existing trim shapes overlap with PG wires. The generated virtual shapes are routing blockages on the specified layer. These virtual shapes can be based on the output of the `defOut` and `streamOut` commands, and edited by the wire editing commands.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `create_virtual_shape_on_pg_wires` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man create_virtual_shape_on_pg_wires`
`-layers {{virtual_layer, power_layer [mask_num]} ...}`	Specifies the pair of layers, which need to create the virtual shapes. You can specify the optional argument `mask_num` with this parameter to select the PG wires.
`-name string`	Specifies the name of the marker shape to be generated. *Default*: `defLayerBlkName`
`-pg_width_list {list_of_supported_width_values}`	Creates virtual shapes on PG pin only for the specified width values. **Note:** This parameter cannot work with the `-pg_width_range` parameter. It means that you can define either a range of width, or a list of width. You can use the `-pg_width_list` parameter with the `-layer` and `-name` parameters.
`-pg_width_range {min_width max_width}`	Specifies the PG width range in which the virtual shapes are needed. *Default*: All the PG wires.

db_pt

```
db_pt
{-x | -y}
pt
[-help]
```

Returns the X or Y coordinate of any point. When you need to find the coordinates of a shape in order to either move the shape or change a coordinate of a shape, the command helps you find the coordinates.

Parameters

`{-x | -y}`	Returns the coordinates of the points. • `-x` returns `x` • `-y` returns `y`
pt	Specifies the point to access the value from. This is a mandatory parameter.
`-help`	Outputs a brief description that includes the type and default information for each `db_pt` parameter. For a detailed description of the command and all its parameters, use the man command: `man db_pt`

Example

- `db_pt -x {10.1 11.1}` returns `10.1`
- `db_pt -y {10.1 11.1}` returns `11.1`
- `db_pt 10.1 11.2 -y returns 11.2`

Related Commands

`db_rect`

db_rect

```
db_rect
[-help]
<rect> {-ll | -ur | -llx | -lly | -urx | -ury | -size | -sizex | -sizey | -width | -length | -center | -area}
```

Returns information about a rectangle, like coordinates, size, and area. When you need to find information about a rectangle, this command helps to find it.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `db_rect` parameter. For a detailed description of the command and all its parameters, use the man command: `man db_rect`
`<rect> {-ll | -ur | -llx | -lly | -urx | -ury | -size | -sizex | -sizey | -width | -length | -center | -area}`	
	Specified rectangle to access values from. This is a mandatory parameter. • `-area`: Returns the area of the rectangle. • `-center`: Returns the center of the rectangle. • `-length`: Returns the larger of the `-sizex` and `-sizey` values. • `-ll`: Returns the lower left point of the rectangle. • `-llx`: Returns the lower left x coordinate of the rectangle. • `-lly`: Returns the lower left y coordinate of the rectangle. • `-size`: Returns the size of the rectangle from lower left to upper right. • `-sizex`: Returns the x difference between the larger and smaller x values of the rectangle. • `-sizey`: Returns the y difference between the larger and smaller y values of the rectangle. • `-ur`: Returns the upper right point of the rectangle. • `-urx`: Returns the upper right x coordinate of the rectangle. • `-ury`: Returns the upper right y coordinate of the rectangle. • `-width`: Returns the smaller of the `-sizex` and `-sizey` values.

Examples

- `db_rect -area {8.1 9.2 10.3 11.4}` returns `4.84`
- `db_rect -center {8.1 9.2 10.3 11.4}` returns `9.2 10.3`
- `db_rect -length {8.1 9.2 10.3 11.4}` returns: `2.2`
- `db_rect -ll {8.1 9.2 10.3 11.4}` returns: `8.1 9.2`
- `db_rect -llx {8.1 9.2 10.3 11.4}` returns: `8.1`
- `db_rect -lly {8.1 9.2 10.3 11.4}` returns: `9.2`
- `db_rect -size {8.1 9.2 10.3 11.4}` returns: `2.2 2.2`
- `db_rect -sizex {8.1 9.2 10.3 11.9}` returns: `2.2`
- `db_rect -sizey {8.1 9.2 10.3 11.9}` returns: `2.7`
- `db_rect -ur {8.1 9.2 10.3 11.4}` returns: `10.3 11.4`
- `db_rect -urx {8.1 9.2 10.3 11.4}` returns: `10.3`
- `db_rect -ury {8.1 9.2 10.3 11.4}` returns: `11.4`
- `db_rect -width {8.1 9.2 10.3 11.4}` returns: `2.2`

Related Commands

db_pt

dbEdge

```
dbEdge
[-clockwise | -counterclockwise]
[{shapelist} [-direction direction] [-d]]
[-index index_number]
```

Returns the edges of a polygon of a shape along with the direction list (N, S, E, W and NE, NW, SE, SW). This helps you identify not only all the edges but also the direction in which the edges are pointing. At a time you can observe one polygon with 'n' number of points.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `dbedge` parameter. For a detailed description of the command and all its parameters, use the man command: `man dbEdge`
`-clockwise`	Sorts the returned list of edges clockwise.
`-counterclockwise`	Sorts the returned list of edges counterclockwise.
`-direction {N S E W NE NW SE SW}`	Returns the edges of a polygon of a shape along with the direction list (N, S, E, W and NE, NW, SE, SW). It can also be a list. For example: `dbEdge -direction {N S NW NE} {10 20 30 40}` If the `-direction` parameter is not used, all the directions in the shape will be returned.
`-d`	Returns user-specified values in database units. Default: All values are in user units, in microns.
`-index index_number`	Specifies the index number of the edge to be returned. The index number starts with `0` as the first edge specified in the shape list, and increases gradually along with the shape list. This number may range from `0` to '*number_of_edges* - 1'.

`{shapelist}`	Can be a rectangle like `{llx lly urx ury}` or a polygon like `{{x1 y1}{x2 y2}{x3 y3}.....}`. Only one rectangle or polygon is accepted. This is a mandatory parameter.
	Examples
	Using a simple L-shape polygon
	`set shape_list {{0 0} {2 0} {2 1} {1 1} {1 2} {0 2}}`
	• All edges
	`dbEdge $shape_list`
	`{{S{0 0}{2 0}} {E{2 0}{2 1}} {N{2 1}{1 1}} {E{1 1}{1 2}} {N{1 2}{0 2}} {W{0 2}{0 0}}}`
	• Only E facing edges
	`dbEdge -direction E $shape_list`
	`{{E{2 0} {2 1}} {E{1 1} {1 2}}}`
	The format of the output is
	`{{<direction> <edge_vertex_1> <edge_vertex_2 }....}`
	Note: The polygon must be rectilinear. Otherwise, the following error occurs:
	`set bad_shape_list {{0 0} {2 0} {2 1} {1 1} {1 2}}`
	`dbEdge $bad_shape_list`
	`**ERROR: (IMPDBTCL-621): The slope of the edge { {1 2} {0 0} } does not match any of the standard directions {N | S | E | W | NE | NW | SE | SW}.`

Related Commands

dbGet

```
dbGet
[-help]
[. objType ]…[. attrName | .? | .?? | .?h]
[-d]
[-e]
[expression]
[-i num]
[-l]
{obj | objList | head | top | selected}
[-p num]
[pattern]
[-regexp]
[-u]
[-v]
```

Returns object and attribute information for the specified database object in the design. The `dbGet` command takes an object or object list as a starting point, then uses a period to traverse to other related objects, or to access attributes. Additional periods can be used to continue traversing the database schema.

For example, the following command returns the master cell names for all of the instances in the design:

```
dbGet top.insts.cell.name
```

- `top` is a pointer to the top cell.
- `insts` is a list of pointers to the instances in the top cell.
- `cell` is a list of pointers to the master cells for each instance.
- `name` is the master cell name.

Copying and pasting pointers in an active session may cause the tool to crash. To prevent this situation, do not:

- Copy pointers from the output of the `dbGet` command and paste to another command as input.
- Copy a pointer from one session to another.

The `dbGet` command is case insensitive. An empty field returns a value of `0x0`.

For a list of the object attributes that can be queried for information, or changed, see Innovus Database Object Information.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `dbGet` parameter. For a detailed description of the command and all its parameters, use the man command: `man dbGet`
`-e`	To avoid NULL (0x0) pointers and results from being printed. This is an optional option of type boolean and would effect all kinds of outputs. In cases of nested `dbGet` statements: • The option should not be used in the inner `dbGet` statement. Correct usage example: `dbGet -e [dbGet -p2 [dbGet -p top.insts.pStatus fixed].cell.name INV1]` • If none of the instances have 'fixed' placement status, the outer dbGet will not return a 0x0 but an empty list which TCL would not consider as a list element. For example, `dbGet [dbGet -p2 [dbGet -p -e top.insts.pStatus fixed].cell.name INV1]`
`-i` *num*	For selecting a specific element from the list being returned as output. The option `-i` *num* would select the the *num*th element starting from 0. The option would also reduce a starting '{' and ending '}' for box and pt type attributes Example : `dbGet top.nets.name sum* -p -i 0` The option would return first pointer in the list of the nets whose name matches the pattern sum*
`-l`	Returns the result with auto-newline.
`-p` *num*	Specifies the level to traverse back through the specified objects for the query. For example, if you specify `-p` or `-p1`, the software traverses one level back through the specified objects. If you specify `-p2`, the software traverses two levels back through the specified objects.The `-p` parameter is used with pattern name matching (*pattern*) to create a subset of names by which to query.
`-u`	Removes duplicate objects from the query results so that the results list only contains unique entries. For information such as cell names, the results list can have the same entry multiple times. You can use the `-u` parameter to filter the results, so that the software only returns a unique list of different cell names.
`-regexp`	Uses regular expression pattern matching (Tcl `regexp` command). *Default:* Uses simple wild card pattern matching
`-d`	Returns values in database integers. *Default:* Returns values in floating point user units
`{`*objList* `| head | top | selected}`	
	Specifies the starting point for the query. • `objList`: Specifies one or more object pointers as the starting point. You can specify a homogeneous or heterogeneous list. • `head`: Specifies the pointer for the root, or head of the design as the starting point (also known as `dbgHead`). • `top`: Specifies the pointer to the top cell in the design as the starting point (also known as `dbgTopCell`). • `selected`: Specifies that the selected objects are the starting point.
`.`*objType*`*`	Specifies the object type to query.
`{`*attrNname* `| .? | .?? | .?h}`	

	Specifies the type of information to return. • *.attrName:* Returns the value of the specified object attribute. • .?: Returns a list of the available objects and attributes for the last object in the query. The software returns the object and attribute names only, not their values. For a list of objects, the field information is returned once for each type of object in the list. Most lists are of the same type; therefore, returning the same fields many times does not make sense. • .??: Returns a list of the objects and attributes, and their values, for the last object in the query. Use the setdbGetMode command to set controls for displaying `.??` query information. • .?h: Returns a list of the available objects and attributes for the last object in the query, and also includes the following information: ◦ A short description for each object and attribute. ◦ The type for each object. ◦ The legal enum values for each attribute. ◦ Whether the attribute value can be set (whether it is editable).

pattern	Specifies a string expression to use to match object or attribute names, or attribute values.
	When you use *pattern* to match object or attribute names, the *pattern* is case insensitive. For example the following commands all return the instance placement status (`inst: pStatus`):
	`dbGet top.insts.? ps*`
	`dbGet top.insts.? PS*`
	`dbGet top.insts.? pS*`
	`dbGet top.insts.? pstatus`
	`dbGet top.insts.? PSTATUS`
	`dbGet top.insts.? pStatus`
	When you use *pattern* to match attribute values (strings or enums), the *pattern* is case sensitive. For example, the following command returns the list of pointers for the instances that have `placed` status:
	`dbGet -p top.insts.pStatus placed`
	However, the following command returns `0x0`, because `PLACED` does not match the legal `placed` enum value:
	`dbGet -p top.insts.pStatus PLACED`
	Default: The software uses simple wildcard matching (`*`, `?`).

expression	Specifies a Tcl expression where values of attributes and also of objects can be accessed and utilized in Tcl "expr" style comparisons.
	Note: Only child attributes and objects of the obect to be tested can be accessed, no additional traversal is allowed.
	`dbGet top.insts {.cell.name == "myBlock"}`
	is not allowed, the correct usage would be:
	`set myBlock [dbGet -p head.allCells.name myBlock]`
	`dbGet top.insts {.cell == $myBlock}`
	For example,
	• Instead of a limited search like:
	`dbGet -p head.allCells.numRefs 5`
	Which is now equivalent to:
	`dbGet head.allCells {.numRefs == 5}`
	The search can also include a number of attributes and objects inside a Tcl expression, such as:
	`dbGet head.allCells {.numRefs > 5 && [string match AND* .name]}`
	• For objects, note that the search will be limited to the children of the current object.
	By a normal `dbGet` *`pattern`* method you use:
	`dbGet -p2 top.nets.sWires.layer.extName metal2`
	When you use the the *`expression`* method:
	`set L2 [dbGet -p head.layers.extName metal2]`
	`dbGet top.nets.sWires {$L2 == .layer}`
	• Logical matching:
	`dbGet top.nets {.name ne "clk"}`
	Returns a list of pointers to nets whose names do not match "clk".

`-v`	Returns all attributes that do not match the `pattern/ expression` or Reverses the result of `pattern/expression` matching. This is similar to the `grep -v` option in UNIX. **Example:** `dbGet -v top.nets.name clk*` Returns all net names that do not match the `clk*` pattern
• Expanded numeric matching: `dbGet top.nets {.numInputTerms > 5}`	Returns a list of pointers to nets that have more than five input terminals. • Multiple attribute matching: accessing multiple attributes of the same object. `dbGet top.nets {.name ne "clk" && .numInputTerms > 5 }` Returns list of pointers to nets with at least one input, but less than or equal to five input. **Note:** The `dbGet` command can not be executed inside a prior instance of `dbGet`. ⓘ Tokens in the expressions which begin a `.' and that are not intened to reference an attribute should be passed inside a Tcl variable, otherwise the expression will try and reference an attribute that does not exist (example: `> dbGet top.insts {[string match .xyzzy .name]}` should be changed to `> set test_name .xyzzy` `> dbGet top.insts {[string match $test_name .name]}`

Note 1: The system can make suggestions or auto-complete entries using predictive text in case you enter a wrong `dbGet` command. The system no longer throws up errors, instead it lists all the probable commands starting with the letters entered so that you can choose which the one which you want to use. This behavior is implemented with the use of the *tab*, like when you press the *Esc* key in UNIX.

For example,

```
innovus 1> dbGet top.n<tab>
name numInputs numPGTerms numPhysTerms
```

```
nets numInsts numPhysInsts numTerms
numBidirs numNets numPhysNets

innovus 1> dbGet top.<tab>
bumps numPhysNets statusPlaced
fPlan numPhysTerms statusPowerAnalyzed
hInst numTerms statusRCExtracted
insts objType statusRouted
markers pgTerms statusScanOpted
name physInsts symmetryR90
nets physNets symmetryX
numBidirs physTerms symmetryY
numInputs pinToCornerDist terms
numInsts props texts
numNets statusClockSynthesized
numPGTerms statusGRouted
numPhysInsts statusIoPlaced

innovus 1> dbGet top.insts.<tab>
box isJtagElem pHaloBot pgCellTerms rHaloTopLayer
boxes isPhysOnly pHaloBox pgTermNets
cell isSpareGate pHaloLeft props
instTerms name pHaloRight pt
isDontTouch objType pHaloTop rHaloBotLayer
isHaloBlock orient pStatus rHaloSideSize

innovus 1> dbGet top.insts.instTerms.name
```

Note 2: The "return" value from `dbGet` is always a list or a string, so when the attribute that is being queried is a list (like `pt` and `rect` attributes) the return result is a list-of-lists structure, even if there is only one internal list being returned. For example:

`$instPtrList` is a pointer to a list of instances
`$instPtr` is a pointer to a single instance

```
> dbGet $instPtrList.pt
{65.34 85.68} {81.84 65.52} {83.16 85.68} ...
```

What is listed above is what is printed to the screen. But since the value is a string and the quotes (") are not displayed.
The actual return result from a scripting point of view is:
`"{65.34 85.68} {81.84 65.52} {83.16 85.68} ..."`

Similarly, in case of a single instance:

```
> dbGet $instPtr.pt
{65.34 85.68}
```

What is listed above is what is printed to the screen. But since the value is a string and the quotes (") are not displayed, the actual return result from a scripting point of view is:

```
"{65.34 85.68}"
```

So, to access the X value for the instance,

```
set x [lindex [lindex [dbGet $instPtrList.pt] 0] 0]
```

or

```
set x [lindex [join [dbGet $instPtrList.pt]] 0]
```

Usage in foreach, as foreach breaks down the list-of-lists into each pt.

```
foreach pt [dbGet $instPtrList.pt] {puts "X= [lindex $pt 0]"}
```

As the behavior of `dbGet` always returns the list-of-lists form, the foreach can be used even if there is only a single internal list.

Frequently used queries

Get the attributes of the selected object	`dbGet selected.??`
Find all nets with name including “clk”	`dbGet top.nets.name *clk*`
All instance pointers of a particular cell type	`dbGet -p2 top.insts.cell.name INV1`
Get all of the inverter lib cells	`dbGet [dbGet -p head.libCells.isInverter 1].name`
All the cell names, which are used in the design	`dbGet -u top.insts.cell.name`
The num of insts in the design	`dbGet top.numInsts`
All the physical only insts	`dbGet [dbGet -p top.insts.isPhysOnly 1].name`
Get all power and ground name in the design	`dbGet [dbGet -p top.nets.isPwrOrGnd 1].name`
Find the cell name of an instance	`dbGet [dbGet -p top.insts.name pm_arbiter/mc_pm_arbiter_regs/U290].cell.name`
Pointers to all registers in the design	`dbGet -p2 top.insts.cell.isSequential 1`
All blocks/macros	`dbGet -p2 top.insts.cell.subClass block`
All top level ports	`dbGet top.terms.name`
Pointers to all CTS clock nets	`dbGet -p1 top.nets.isCTSClock 1`
All of the nets skipped during routing	`dbGet [dbGet top.nets.skipRouting 1 -p].name`
Find the net connected to a pin	`dbGet [dbGet -p top.insts.instTerms.name <full pin name>].net.name`
Pointers to all fixed nets	`dbGet -p2 top.nets.wires.status fixed`
Pointers to all donttouch insts	`dbGet top.insts.isDontTouch 1 -p`
Find all the power domains	`dbGet top.fplan.groups.pd.name`
Find nets with no DEF SPECIALNETS wiring	`dbGet [dbGet top.nets {.sWires == 0x0 && .sVias == 0x0}].name`

Find the metal2 routing pitch (X)	`dbGet [dbGet -p [dbGet -p1 head.layers.type routing].name *2].pitchX`
	or
	`dbGet [dbGet head.layers.name metal2 -p].pitchX`

Find all instance connected to a port	`dbGet [dbGet -p top.terms.name <port_name>].net.instTerms.inst.name`
Pointers to AND gates that used more than 5 times in the design	`dbGet head.allCells {.numRefs > 5 && [string match AND* .name]}`
Pointers to cells that are used more than 10 times in the design	`dbGet [dbGet -p head.allCells.objType libCell] {.numRefs > 10}`
Pointers to cells that have 4 or less inputs and more than 2 PG terms	`dbGet [dbGet -p head.allCells.objType libCell] {.numInputs <= 4 && .numPGTerms > 2}`
Pointers to non-clk nets that have more than five input terminals	`dbGet top.nets {.name ne "clk" && .numInputTerms > 5 }`

Examples

- The following command returns the instance names for the instances with names that match the `*reg*` pattern:
  `dbGet top.insts.name *reg*`
- The following command returns the names of all nets that start with the letter `I`. Specifying this command returns the same information as specifying the `dbFindNetsByName I*` command.
  `dbGet top.nets.name I*`
- The following command returns the names of all terminals that start with the letter `I`. Specifying this command returns the same information as specifying the `dbFindTermsByName I*` command.
  `dbGet top.terms.name I*`
- The following command returns a list of pointers to the instances that have a placement status of `Fixed`:
  `dbGet -p top.insts.pStatus fixed`

- The following command returns a list of names for instances that have a placement status of `Fixed`:
  ```
  dbGet [dbGet -p top.insts.pStatus fixed].name
  ```
- The following commands also return a list of instance names for instances that have a placement status of Fixed:
  ```
  set fixedInst [dbGet -p top.insts.pStatus fixed]
  dbGet $fixedInsts.name
  ```
- The following command returns the status of the top cell in the design:
  ```
  dbGet top.?? status*
  ```

  The software displays the following information:
  ```
  statusClockSynthesized: 0
  statusGRouted: 0
  statusIoPlaced: 1
  statusPlaced: 1
  statusPowerAnalyzed: 0
  statusRCExtracted: 0
  statusRouted: 0
  statusScanOpted: 0
  ```
- The following command returns a list of the available objects and attributes for instances of the top cell:
  ```
  dbGet top.insts.?
  ```

  The software displays the following information:
  ```
  inst: box cell instTerms isDontTouch isHaloBlock isJtagElem isPhysOnly isSpareGate name objType orient pStatus pgCellTerms pgTermNets
  pt
  ```
- The following command displays the available objects and attributes, and their values, for the instances in the top cell. By default, the software displays information for the first 10 instances only. Use the `setdbGetMode` command to change the display limit.
  ```
  dbGet top.insts.??
  ```

  The software displays the following information:
  ```
  box: {314.16 302.4 316.8 307.44}
  cell: 0x12186fa8
  instTerms: 0x1330fa38 0x1330fa6c
  isDontTouch: 0
  isHaloBlock: 0
  isJtagElem: 0
  isPhysOnly: 0
  isSpareGate: 0
  name: i_10181
  objType : inst
  orient : MX
  pStatus : placed
  pgCellTerms: 0x13811088 0x138110cc
  pgTermNets: 0x0
  pt: {314.16 302.4}
  box: {258.72 282.24 261.36 287.28}
  cell: 0x12186c38
  instTerms: 0x1330faa0 0x1330fad4
  isDontTouch: 0
  isHaloBlock: 0
  isJtagElem: 0
  isPhysOnly: 0
  isSpareGate: 0
  name: i_10177
  objType : inst
  orient : MX
  ```

```
pStatus : placed
pgCellTerms: 0x13810ef0 0x13810f34
pgTermNets: 0x0
pt: {258.72 282.24}
...
```

- The following command returns a list of the available objects and attributes for instances of the top cell. The software also displays a short description for each object and attribute, the type of each object, the legal enum values for each attribute, and whether the attribute value can be set by the user.

  ```
  dbGet top.insts.?h
  ```

  The software displays the following information:

  ```
  ========================================================================
  inst: Instance - canonical (flat), equivalent to DEF COMPONENT. Points to a libCell or ptnCell
  ========================================================================
  box: rect, Bounding box of instance
  cell: obj(libCell ptnCell), Pointer to child cell master or ptnCell
  instTerms: objList(instTerm), List of pointers to instance terminal
  isDontTouch: bool, Indicates that the instance is marked Don't Touch
  isHaloBlock: bool, Indicates that the instance is a halo block
  isJtagElem: bool, Indicates that the instance is a Jtag element
  isPhysOnly: bool, Indicates that the instance is physicl only
  isSpareGate: bool, Indicates that the instance is a spare gate
  name: string, Fully qualified (path) name of the instance
  objType: enum(bndry densityShape fPlan group hInst hInstTerm hNet hTerm head inst instTerm layer libCell net netGroup pBlkg pd pinGroup
  prop ptnCell rBlkg sNet sWire shape stdRow term topCell vCell via wire), Object type: Instance
  orient(settable): enum(MX MX90 MY MY90 R0 R180 R270 R90 Unknown), Instance placement orientation
  pStatus(settable): enum(cover fixed placed unplaced), Instance placement status
  pgCellTerms: objList(term), List of pointers to the instance's power terminals
  pgTermNets: objList(net), List of pointers to nets attached to P/G terminals
  pt(settable): pt, Location of the instance
  b
  ```

- In order to query all nets that have no wiring (regular or special) more efficently, use:

  ```
  set netsWithNoRouting [dbGet top.nets {.wires == 0x0 && .vias == 0x0 && .sWires== 0x0 && .sVias == 0x0} ]
  foreach netWithNoRouting $netsWithNoRouting { Puts "** Net [dbGet $netWithNoRouting.name] has no wiring."}
  ```

- In order to display the Power/Ground connections for a specified instance, use:

  ```
  set inst [dbGet -p top.insts.name my_inst_name]
  foreach pgCellTermName [dbGet $inst.pgCellTerms.name] pgTermNetName [dbGet $inst.pgTermNets.name]
  {Puts "Instance \"[dbGet $inst.name]\" terminal \"$pgCellTermName\" is connected to net \"$pgTermNetName\"."}
  ```

- **Finding nets with no DEF SPECIALNETS wiring**

  ```
  set netNames [dbGet [dbGet top.nets {.sWires == 0x0 && .sVias == 0x0}].name]
  foreach netName $netNames {
     Puts "$netName has no special wiring"
  }
  vs
  foreach net [dbGet top.nets] {
     if { [dbGet $net.sWires] == 0x0 && [dbGet $net.sVias] == 0x0 } {
   Puts "[dbGet $net.name] has no special wiring"
     }
  }
  ```

The first method calls `dbGet` once to access the DEF SPECIALNETS data, the second makes 2xN calls (where N is the number of nets in the design) to access the DEF SPECIALNETS data. The calls to access the DEF SPECIALNETS data do an internal initialization that can be expensive on large designs, so minimizing the number of times that happens can greatly improve the run time of a proc/script.

dbQuery

```
dbQuery
[-help]
[-areas {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2} ...}]
[-bbox_overlap]
[-d]
[-layers {layer1 layer2 ...} [-strict_via_inst_layer_check]]
[-objType {bump busGuide inst instAllShapes instTerm pgInstTerm term marker net pBlkg pinShape pWire rBlkg regular resizeBlkg row special sViaInst sWire viaInst wire whatIfWire whatIfVia}]
[-polygons {x11 y11 x12 y12 x13 y13 ...}]
[-abut_only] | [-enclosed_only] | [-overlap_only]
```

Returns a list of objects that overlap or abut specific areas by default. It uses the polygon outline of the objects to check for overlap, as described in the description of the `-objType` parameter. This command supports all types of routing blockages such as partial, fill, and slot.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `dbQuery` parameter. For a detailed description of the command and all its parameters, use the man command: `man dbQuery`
`-abut_only`	Returns only those objects that abut the search area. No part of the object polygon overlaps the search area, but at least one point or line of intersection occurs between the object polygon and the search area. A single point of abutment (such as a corner or crossing edges) is also considered as abutted. When multiple areas are specified, the object is returned as long as it abuts one of the search areas.
`-areas {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2} ...}`	
	Specifies the search areas, where `ll` = lower left, `ur` = upper right. By default, all the objects overlapping or abutting these areas are returned, unless `-abut_only`, `-enclosed_only`, or `-overlap_only` is specified. The polygon shape of the object is used for the overlap check. The units are in microns (unless `-d` is specified). The input can be in either a single `rect {llx1 lly1 urx1 ury1}`, or a list of `rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}}`. A `rect` using "two points" format like `{{{llx1 lly1} {urx1 ury1}} {{llx2 lly2} {urx2 ury2}}}` is also allowed. But input format like `{llx1 lly1 urx1 ury1 llx2 lly2 urx2 ury2}` or `{{llx1 lly1} {urx1 ury1} {llx2 lly2} {urx2 ury2}}` is illegal and not allowed. The resulting area to check for overlap can be a rectangle, line, or a point. When one object intersects multiple search areas, it will only be returned once.
`-bbox_overlap`	Uses bounding-box of the object rather than the polygon shape of the object for overlap, abut, or enclosure check. For example, an `inst` that is of L-shape, will not be returned if the `-areas` parameter overlaps only the upper-right of the bounding-box without touching any part of the L-shaped, unless the `-bbox_overlap` parameter is included.
`-d`	Specifies the `-areas` values that are in database units rather than microns. *Default*: `um`
`-enclosed_only`	Returns only those objects, which are completely enclosed inside the search area. The object polygon is fully enclosed by the search area. No part of the object polygon sticks outside the search area, although it may abut the search area edges. When multiple areas are specified, the object will be returned as long as it is enclosed in one of the search areas.
`-layers {layer1 layer2 …}`	
	Returns only those objects, which are on the specified layers. This parameter applies only to object types: `pinShape`, `pWire`, `rBlkg`, `regular`, `special`, `sViaInst`, `sWire`, `viaInst`, `wire`, `whatIfWire`, and `whatIfVia`. A `viaInst`, `sViaInst`, or `whatIfVia` object will be returned if any of the via's bottom layer, cut layer, or top layer matches with one of the specified layers. Other object types ignore this parameter and will always be returned.
`-objType objTypeList`	

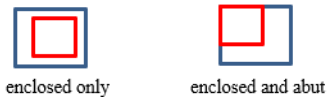
	Specifies a list of object types to search for overlaps in the area. Multiple object types can be searched at the same time. The objects currently supported include: `bump busGuide inst instAllShapes instTerm pgInstTerm term marker net pBlkg pinShape pWire rBlkg regular resizeBlkg row special sViaInst sWire viaInst wire whatIfWire whatIfVia` Here: • `regular` is the union of `wire`, `pWire`, and `viaInst`. • `special` is the union of `sWire` and `sViaInst`. Objects with multiple shapes or non-rectangular shapes use a polygon to check for overlap, as described below. • `bump` has no placement overlap area, so it uses the polygon of all the OBS and PIN shapes. • `inst` uses the polygon of its placement overlap checks (for example the LEF SIZE or OVERLAP shapes), including any placement halo (if there is any) but not any routing halo. OBS shapes or PIN shapes (like standard-cell power-pins) that stick outside the placement overlap area are not included. • `instAllShapes` is the same as `inst`, except that it includes all OBS shapes and PIN shapes even if they stick outside the placement overlap area. • `instTerm` uses the polygon of all the pin-shapes of the `instTerm`. • `pgInstTerm` uses the polygon of all the pin-shapes of the `pgInstTerm`. • `pinShape` uses the polygon of all the shapes of the top-level `pinShapes`. • `net` uses the bounding-box of all the regular routing shapes on the net. Pin-shapes or special-route shapes attached to the net are not included. If you want polygon-level checking, you must ask for `wires` and `viaInsts` instead. • `term` uses the polygon of all the pin-shapes of the top-level term. • `viaInst` uses the polygon of all the shapes of the via. • `sViaInst` uses the polygon of all the shapes of the via. *Default*: `inst`
`-overlap_only`	Returns only those objects, which are partially overlapped with the search area. Some part of the object polygon overlaps the search area, whereas some of its part is outside the search area. A single point of contact is not considered as an overlap. When multiple areas are specified, the object is returned as long as it overlaps with one of the search areas.
`-polygons {x11 y11 x12 y12 x13 y13 ...}`	
	Specifies a polygon search area. By default, all the objects overlapping or abutting this area are returned on using the `-polygons` parameter, unless the `-abut_only`, `-enclosed_only`, or `-overlap_only` parameter is specified. The units are in microns (unless `-d` is specified, which indicates the database units). The format can be in either like `{x11 y11 x12 y12 x13 y13 ...}` or `{{x11 y11} {x12 y12} {x13 y13} ...}`. The polygon must be well-formed, not have zero area, and not have crossing edges.
`-strict_via_inst_layer_check`	
	Returns only those objects on the specified layer, which match with one of the via's bottom, cut, or top layers. This parameter does not return the objects of the via on the unmatched layers. It works only for `sViaInst` and `viaInst`. ⚠ This parameter works only when the `-layers` parameter is used in the background.

Examples

- The following command returns all the instances and routing-blockages on the `metal6` and `metal7` layers that are partially overlapped, abutted, or enclosed in the given triangle area:
  ```
  dbQuery -objType {inst rBlkg} -polygons {100 100 110 110 100 110} -layers {Metal6 Metal7}
  ```
- The following command returns all the instances and routing-blockages on the `metal6` and `metal7` layers that are partially overlapped, abutted, or enclosed in the given triangle area using the bounding-box of the objects:
  ```
  dbQuery -objType {inst rBlkg} -polygons {100 100 110 110 100 110} -layers {Metal6 Metal7}} -bbox_overlap
  ```
- The following command returns all the instances and regular wires on the `metal6` and `metal7`layers that are abutted in the give search areas:
  ```
  dbQuery -objType {inst wire} -areas {{0 0 100 100} {150 100 200 200}} -layers {Metal6 Metal7}} -abut_only
  ```
- The following command returns all the instances and regular wires on the `metal6` and `metal7`layers that are abutted in the given search areas using the bounding-box of the objects:
  ```
  dbQuery -objType {inst wire} -areas {{0 0 100 100} {150 100 200 200}} -layers {Metal6 Metal7}} -abut_only -bbox_overlap
  ```
- Following are the figures to illustrate each position relation. The instances presented by the red rectangles are returned with the specified parameter when the search area presented in the blue rectangle are specified.
  - **`-abut_only`**

    
  - **`-overlap_only`**

  - **`-enclosed_only`**

Note:

1. If none of the above three parameters is specified, all the instances presented by the red rectangles will be returned, by default.
2. For querying object with multi-shape (such as `instTerm` or `pinShape`) in multiple search areas, if one of its shapes is enclosed/abutted/overlapped with any one of the specified areas, the object will be returned.

dbSchema

```
dbSchema
[-help]
[objNamePattern [objAttrNamePattern]]
[-parent objNamePatternForParent [-list]]
```

Returns all of the available objects and attributes for the specified database object. It also includes the following information.

- A short description for each object and attribute.
- The type for each object.
- The legal enum values for each attribute.
- Whether the attribute value can be set (whether it is editable).

You can specify an object name, or a simple search pattern to match object names. If you specify `dbSchema`, the software returns a list of the database object names. If you specify `dbSchema *`, the software returns information for all database objects. All query information is output in the log file.

The `dbSchema` command also obeys the setDbGetMode `-displayFormat` setting to determine whether information is returned in simple or table format.

You can use the `dbSchema` command to return information on any database object listed in the Innovus Database Object Information.

Note: The information returned by the `dbSchema` command is equivalent to that returned by the dbGet command with the `.?h` operator; however, the `dbSchema` command does not require the object you query to actually exist in the database. For example, if you want to query related objects and attributes for a placement blockage, but do not have any placement blockages in the design, you can use the `dbSchema` command, but not the `dbGet` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `dbSchema` parameter. For a detailed description of the command and all its parameters, use the man command: `man dbSchema`.
`-list`	Return the list of parent objects. This option is of type boolean and is optional.
`objNamePattern`	Specifies the object for which to return the information. You can specify an object name (such as `inst`, or `term`), or a string expression to use to match object names. The software uses simple wildcard matching (`*`, `?`).
`objAttrNamePattern`	Specifies a secondary pattern for filtering object, or obejct attributes for the specified objects. This is similar to the `.?h [pattern]` filtering in the `dbGet` command.
`-parent` *`objNamePatternForParent`*	Displays the Object/Attribute for which parents need to be found from the specified object type(s). This option is of type string and is optional.

Examples

- The following command returns the available net attributes that begin with `is`:

```
dbSchema net is*

================================================================================
net: Canonical (flat) net (equivalent to connectivity in DEF NETS and
SPECIALNETS
================================================================================
isClock: bool, Indicates that net is a clock net
isExternal: bool, Indicates that net is connected to a terminal
isFixedBump: bool, Indicates that the net is connected to a bump
isGnd: bool, Indicates that net is ground
isPatternTrunk: bool, Indicates that the net is routed with a trunk pattern
isPhysOnly: bool, Indicates that the net is physical only
isPwrOrGnd: bool, Indicates that net is power or ground
isScanNet: bool, Indicates that net is a scan net
```

- The following command returns all objects that contain the attribute `pStatus`:

```
dbschema * pStatus
```

```
================================================================================
bump: Bump
----------
pStatus(settable): enum(cover fixed placed softFixed unplaced), Bump placement status
================================================================================================
inst: Instance - canonical (flat), equivalent to DEF COMPONENT. Points to a libCell or ptnCell.
================================================================================
pStatus(settable): enum(cover fixed placed softFixed unplaced), This attribute is the placement status of an instance during placement
and optimization. The placer will look at both pStatus and pStatusCTS and use the more restrictive value.
================================================
term: Terminal for libCell, ptnCell, or topCell
================================================
pStatus(settable): enum(cover fixed placed softFixed unplaced), Placement Status of terminal (not for libCell terms)
```

- The following command returns the available objects and attributes for an instance:

```
dbSchema inst
================================================================================
inst: Instance - canonical (flat), equivalent to DEF COMPONENT. Points to a libCell or ptnCell.
================================================================================
box: rect, Bounding box of the instance
cell: obj(libCell ptnCell), Pointer to child cell master or ptnCell
instTerms: objList(instTerm), List of pointers to instance terminals
isDontTouch: bool, Indicates that the instance is marked Don't Touch
isHaloBlock: bool, Indicates that the instance is a halo block
isJtagElem: bool, Indicates that the instance is a Jtag element
isPhysOnly: bool, Indicates that the instance is physical only
isSpareGate: bool, Indicates that the instance is a spare gate
name: string, Fully qualified (path) name of the instance
objType: enum(bndry densityShape fPlan group hInst hInstTerm hNet hTerm head inst instTerm layer libCell net netGroup pBlkg pd prop
ptnCell rBlkg row sWire shape term topCell vCell via wire), Object type: Instance
orient(settable): enum(MX MX90 MY MY90 R0 R180 R270 R90 Unknown), Instance placement orientation
pStatus(settable): enum(cover fixed placed unplaced), Instance placement status
pgCellTerms: objList(term), List of pointers to the instance's power terminals
pgTermNets: objList(net), List of pointers to nets attached to P/G terminals
pt(settable): pt, Location of the instance
```

- The following command returns the available objects and attributes for database objects that start with the letter p:

```
dbSchema p*
================================================
pBlkg: Placement blockage (hard, soft, partial)
================================================
attr(settable): enum(inst pushdown undefined), Indicates whether the blockage has been pushed down or is assoicated with an instance.
name(settable): string, Name of partial blockage
objType: enum(bndry densityShape fPlan group hInst hInstTerm hNet hTerm head inst instTerm layer libCell net netGroup pBlkg pd prop
ptnCell rBlkg row sWire shape term topCell vCell via wire), Object type: Placement blockage
shapes: objList(densityShape shape), List of pointers to shapes (hard/soft) or densityShapes (partial)
type(settable): enum(hard partial soft), Blockage type (hard, soft, partial)
================
pd: Power domain
================
core2Bot(settable): coord, Distance between the power domain edge and it's core box
core2Left(settable): coord, Distance between the power domain edge and it's core box
core2Right(settable): coord, Distance between the power domain edge and it's core box
core2Top(settable): coord, Distance between the power domain edge and it's core box
extBot(settable): coord, Maximum search distance for power connections
```

```
extLeft(settable): coord, Maximum search distance for power connections
extRight(settable): coord, Maximum search distance for power connections
extTop(settable): coord, Maximum search distance for power connections
gapBot(settable): coord, Minimum spacing to other power domains or rows
gapLeft(settable): coord, Minimum spacing to other power domains or rows
gapRight(settable): coord, Minimum spacing to other power domains or rows
gapTop(settable): coord, Minimum spacing to other power domains or rows
group: obj(group)
isAlwaysOn(settable): bool, Indicates that the power domain is always on
isDefault: bool, Indicates that the power domain is the default power domain
name: string, Name of the power domain
objType: enum(bndry densityShape fPlan group hInst hInstTerm hNet hTerm head inst instTerm layer libCell net netGroup pBlkg pd prop
ptnCell rBlkg row sWire shape term topCell vCell via wire), Object type: Power domain
==============
prop: Property
==============
name: string, Property name
objType: enum(bndry densityShape fPlan group hInst hInstTerm hNet hTerm head inst instTerm layer libCell net netGroup pBlkg pd prop
ptnCell rBlkg row sWire shape term topCell vCell via wire), Object type: Property
parent: obj(parent), Pointer to the parent object referencing the property
value: value, Property value (depends on valueType)
valuetype: enum(Double bits box integer loc pointer string), Type of value stored in the property (int, float, etc.)
=====================================================
ptnCell: Partition cell, created by partition command
=====================================================
name: string, Name of cell
numBidirs: int, Number of bidir terminals in the cell
numInputs: int, Number of input terminals in the cell
numPGTerms: int, Number of power/ground terminals in the cell
numRefs: int, Number of times cell is used in design
numTerms: int, Number of terminals in the cell
objType: enum(bndry densityShape fPlan group hInst hInstTerm hNet hTerm head inst instTerm layer libCell net netGroup pBlkg pd prop
ptnCell rBlkg row sWire shape term topCell vCell via wire), Object type: Partition cell
pgTerms: objList(term), List of power/ground terminals in the cell
props: objList(prop), List of pointers to properties
terms: objList(term), List of pointers to terminals in the cell
```

- The following command returns the available object and attributes for all types of blockages:

```
dbSchema *Blkg
================================================
pBlkg: Placement blockage (hard, soft, partial)
================================================
attr(settable): enum(inst pushdown undefined), Indicates whether the blockage has been pushed down or is assoicated with an instance.
name(settable): string, Name of partial blockage
objType: enum(bndry densityShape fPlan group hInst hInstTerm hNet hTerm head inst instTerm layer libCell net netGroup pBlkg pd prop
ptnCell rBlkg row sWire shape term topCell vCell via wire), Object type: Placement blockage
shapes: objList(densityShape shape), List of pointers to shapes (hard/soft) or densityShapes (partial)
type(settable): enum(hard partial soft), Blockage type (hard, soft, partial)
=======================
rBlkg: Routing blockage
=======================
attr(settable): enum(default exceptPGNet fills inst pushdown slots), Routing blockage qualifier (inst, pushdown, etc.)
layer: obj(layer), Pointer to layer of blockage
name(settable): string, Name of routing blockage
objType: enum(bndry densityShape fPlan group hInst hInstTerm hNet hTerm head inst instTerm layer libCell net netGroup pBlkg pd prop
```

```
ptnCell rBlkg row sWire shape term topCell vCell via wire), Object type: Routing blockage
shapes: objList(shape), List of pointers to shapes that define the blockage area
```

- The following commands return all available objects and attributes for a via in table format:

```
setDbGetMode -displayFormat table

dbSchema via
================================================
via: Via cell (equivalent to LEF VIA or DEF VIA)
================================================
botLayer                        | obj(layer), Pointer to bottom routing layer
botRects                        | rect, List of rectangles (typically only one) on bottom layer
cutLayer | obj(layer), Pointer to cut layer
cutRects | rect, List of rectangles on cut layer
isDefault | bool, Indicates that the via is a default via (LEF VIA DEFAULT)
isNonDefault                    | bool, Indicates that the via is declared in a LEF NONDEFAULTRULE
name | string, Via name
objType | enum(bndry densityShape fPlan group hInst hInstTerm hNet hTerm head inst instTerm layer libCell net netGroup pBlkg pd prop
ptnCell rBlkg row sWire shape term topCell vCell via wire), Object type: Via cell
topLayer | obj(layer), Pointer to top routing layer
topRects | rect, List of rectangles (typically only one) on top routing layer
```

- The following command returns clarifies that the attribute name is varied on querying it as an object or attribute:

```
dbschema fPlan pBlkg
**ERROR: (IMPDBTCL-325): No pattern of attribute 'pBlkg' found in the supported patterns. For help use 'dbSchema fPlan' or 'dbSchema
fPlan *' to get list of all supported attributes.
```

  Normally, the attribute name should be plural,as shown below:

```
dbschema fPlan pBlkgs

fPlan: Floorplan header with pointers to floorplan objects
pBlkgs: objList(pBlkg), List of pointers to placement blockages dbschema pBlkg
pBlkg: Placement blockage (hard, soft, partial, macroOnly)
area: area, Area of the placement blockage as defined by the LEF MACRO SIZE or OVERLAP information
attr(settable): enum(pushdown undefined), Indicates whether the blockage has been pushed down
boxes(settable): list(rect), List of rectangles that define the shape of placement blockage
density(settable): float, The max placement density percent allowed inside this pBlkg. It must be in the range of 5 to 100, in steps of
5. It is only valid if the type = partial or soft. For example, a partial placement percentage of 75 percent means that up to 75
percent of placement density is allowed in the area. If the type is not partial or soft, a value of 0 is returned.
inst: obj(inst), Pointer to the instance that the placement blockage is associated with (equivalent to DEF BLOCKAGES + COMPONENT)
isNoFlop(settable): bool, Indicate a partial placement blockage to prevent flops to be placed underneath.
isPushdown(settable): bool, Indicates that placement blockage has been pushed down from a higher level in the design hierarchy.
name(settable): string, Name of placement blockage
objType: enum(antennaData antennaModel bndry bump bus busGuide busSinkGroup cellDensity densityShape fPlan foreign gCellGridDef group
guiLine guiPoly guiRect guiText hInst hInstTerm hNet hTerm head inst instTerm io layer layerRule layerShape libCell marker net netGroup
pBlkg pWire pd pgInstTerm pin pinGroup pinGuide pkgComponent pkgObject prop ptn ptnCell ptnPinBlkg rBlkg resistor resizeBlkg routeType
row rule sViaInst sWire sdp shape shapeVia site stackViaRule term text topCell trackDef vCell vWire via viaInst viaRuleGenerate wire),
Object type: Placement blockage
shapes: objList(densityShape shape), List of pointers to shapes
type(settable): enum(hard macroOnly partial soft), Blockage type (hard, macroOnly, partial, soft)
```

dbSet

```
dbSet
[-d]
{objList | head | top | selected}
[.objType]*.attrName attrValue
[-help]
```

Changes the specified attribute value for a database object. The `dbSet` command takes an object or object list as a starting point, then uses a period to traverse to other related objects, or access attributes. Additional periods can be used to continue traversing the database schema.

The `dbGet` command also helps in finding out the settable objects. For example, after selecting an instance and querying its `pt*` attributes with `dbGet selected.?h pt*`, the software gives displays:

- pt(settable): pt, location of the instance
- pt_x(settable): x coordinate of location of the instance
- pt_y(settable): y coordinate of location of the instance.

The `pt`, `pt_x`, and `pt_y` attributes of an instance can also be changed using `dbSet`. In the following example, the name attribute of the selected instance cannot be changed with `dbSet`:

```
dbget selected.?h name
```

Following is the output of the above command:

```
name: string, Fully qualified (path) name of the instance
```

The `dbSet` command does not create or delete objects. You may also change the mask of the multi-color pillar via through the `dbSet` command, as shown below:

```
dbSet $via.cutMasks $mask
```

Use the `dbGet` command with the `.?h` operator, or see Innovus Database Object Information, to find out which object attributes can be set.

Parameters

`-d`	Specifies values in database units, specified in integers. *Default:* Specifies values in user units, in microns.
`-help`	Outputs a brief description that includes the type and default information for each `dbSet` parameter. For a detailed description of the command and all its parameters, use the man command: `man dbSet`.
`objList`	Specifies one or more object pointers. The list must be homogeneous.
`head`	Specifies the pointer for the root, or head of the design as the starting point (also known as `dbgHead`).
`top`	Specifies the pointer to the top cell in the design as the starting point (also known as `dbgTopCell`).
`selected`	Specifies that the selected object (or objects) is the starting point.
`.objType`	Specifies the object type.
`.attrName`	Specifies the object attribute to change.
`attrValue`	Specifies the new attribute value.

Examples

- The following command changes the placement status of the top cell instances to fixed:
  ```
  dbSet top.insts.pStatus fixed
  ```
- The following command sets all the pad instances to the placement status `fixed`:
  ```
  dbSet [dbGet top.insts.cell.baseClass pad -p2].pstatus fixed
  ```

dbShape

```
dbShape
[-help]
[-d]
[-step step]
[-output polygon|rect|hrect|area]
shapeList [AND shapeList | ANDNOT shapeList | OR shapeList | XOR shapeList
| INSIDE shapeList | OUTSIDE shapeList | ENCLOSE shapeList | STRADDLE shapeList
| BBOX | HOLES | NOHOLES | BBOX_CIRCLE | BBOX_OCTAGON | MOVE {dx dy | SIZE value | SIZEX value | SIZEY value] ...
```

Performs geometric (such as SIZE and BBOX) and logical (such as AND and ANDNOT) operations on shapes (a polygon, a rectangle, or a list of rectangles and polygons).

Parameters

`-help`	Prints a brief description that includes the type and default information of each `dbShape` parameter. For a detailed description of the command and all its parameters, use the man command: `man dbShape`
`-d`	Specifies values in database units, specified in integers. All `shapeList` values as well as values for MOVE, SIZE, and step should u The output units are the same with the input units. *Default:* Specifies values in user-defined units, in microns.
`-step`	Specifies the step size if output format is rectangle, required to convert non-orthogonal shapes into a series of rectangles. *Default*: The `minwidth` value of the first routing layer. *Type:* coord, optional
`-output` *polygon|rect|hrect|area*	
	Specifies the output format. • `polygon`: Polygon shape • `rect`: Vertical rectangles **Note:** This value works only for the orthogonal shapes. • `hrect`: Horizontal rectangles **Note:** This value works only for the orthogonal shapes. • `area`: Total area of final shape *Default:* `rect` (string)
`shapeList`	Specifies a polygon or a rectangle, or a list of polygons and rectangles. The shape of the polygon or rectangle in one `shapeList` will • `polygon: {{x y} {x y} {x y} ... };` • `rect: {x1 y1 x2 y2}` *Type:* `list`
`AND` *shapeList*	Is a binary operator that is the intersection of `shapeLists`.
`ANDNOT` *shapeList*	Is a binary operator defining the initial `shapeList` minus the final `shapeList`.
`OR` *shapelist*	Is a binary operator defining the union of shapelists.
`XOR` *shapeList*	Is a binary operator of the `shapeList`: OR minus AND. It is a string and is optional.
`INSIDE` *shapeList*	Is a binary operator for the initial shapes that are inside (including touching) one of the shapes from the second list.
`OUTSIDE` *shapeList*	Is a binary operator for the initial shapes that are outside (including touching) of one of the shapes from the second list.
`ENCLOSE` *shapeList*	Is a binary operator for the initial shapes that completely enclose at least one shape from the second list.
`STRADDLE` *shapeList*	Is a binary operator for the initial shapes that are partially inside and partially outside at least one shape from the second list.
`MOVE {`*dx dy*`}`	Is a unary operator that moves the shape.

`BBOX`	Is a unary operator that computes the bounding box of the `shapeList`. This is a string and optional.
`BBOX_CIRCLE`	Is a unary operator that creates a circle shape. For example, the following command creates a circle within the specified coordinate `dbShape {0 0 10 10} BBOX_CIRCLE -output {polygon}` Following is the output of the above command: `BBOX_OCTAGON`	Is a unary operator that creates an octagon shape. For example, the following command creates an octagon within the specified coo `dbShape {0 0 10 10} BBOX_OCTAGON -output {polygon}` Following is the output of the above command: `HOLES`	Is a unary operator that gives the list of the new shapes that fill holes in the original `shapeList`.
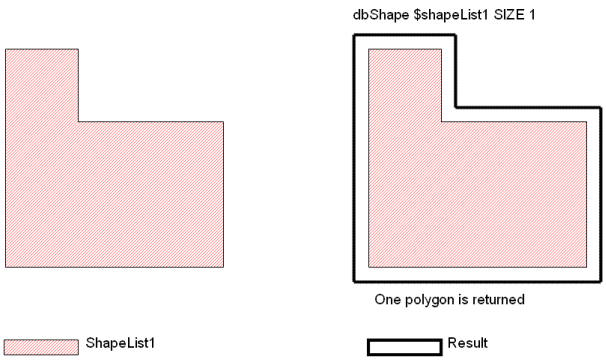
`NOHOLES`	Is a unary operator that gives the list of the new shapes that include the filled holes in the original `shapeList`. This is same as `dbShape` *`shapeList`* `HOLES` OR *`shapeList`*
`SIZE` *`value`*	Is a unary operator that increases the size of the `shapeList` by `"value"`.
`SIZEX` *`value`*	Is a unary operator that increases the size of the shapes in the list in the X-direction by *`value`*. This parameter works only for the orth `-step` parameter to convert the shape into series of rectangles first.
`SIZEY` *`value`*	Is a unary operator that increases the size of the shapes in the list in the Y-direction by *`value`*. This parameter works only for the orth `-step` parameter to convert the shape into series of rectangles first.

Note: All the shapes processed by `dbShape` must have non-zero area. If a *shapeList* contains a list of rectangles and one of them is zero-area, it will be dropped. Also, during negative sizing or other operations, if a zero-area shape is created, it will be dropped from the output (or intermediate results).

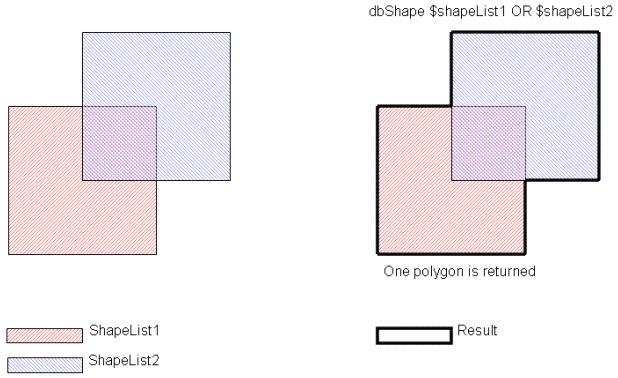
For example, a rectangle that is 4x4 or smaller will disappear when using `dbShape $rect SIZE -2 SIZE 2`, while shapes larger than 4x4 will be returned to their original state.
The same is true for protrusions with width less than 4.

Examples

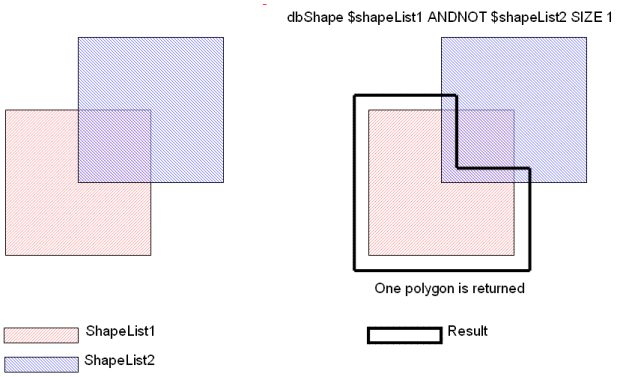
- **Unary**:



- **Binary**:



- **Combination**:



- The following command returns the intersection (as a list of rectangles) between the shapes in the `$shapes1` and the `$shapes2` lists:

  ```
  dbShape $shapes1 AND $shapes2
  ```

- The following command returns the area of the intersection between the shapes in the `$shapes1` and the `$shapes2` lists:

  ```
  dbShape -output area $shapes1 AND $shapes2
  ```

- The following commands return the merged polygon of `shapes1`. The rectangle shapes in `shapes1` will merge firstly before performing the `STRADDLE` operation, if they intersect with each other.

  ```
  set shapes1 [list {0.1 0.1 0.4 0.4} {0.2 0.2 0.6 0.6}]
  set shapes2 {0.1 0.1 0.5 0.5}
  dbShape -output polygon $shapes1 STRADDLE $shapes2
  {{0.6 0.6} {0.2 0.6} {0.2 0.4} {0.1 0.4} {0.1 0.1} {0.4 0.1} {0.4 0.2} {0.6 0.2}}
  ```

dbTransform

```
dbTransform
[-help]
[-d]{-inst instPtr | -hInst instPtr | {-cell cellPtr -orient orientEnum -pt {x y}}}
{-localPt list | -globalPt list}
```

Takes coordinates local to a cell and returns them in context with the global design space. You can specify a specific instance of a cell in the design, or you can specify a library cell and its location in the design, and instruct the software to perform a "what-if" translation of the coordinates within that cell.

Parameters

-help	Prints a brief description that includes the type and default information for each `dbTransform` parameter. For a detailed description of the command and all its parameters, use the man command: `man dbTransform`
`-cell` *cellPtr*	Specifies a pointer to a library cell. You must specify the `-pt` and `-orient` parameters with `-cell`.
`-d`	Specifies the values in database units, specified in integers. This is an optional parameter. If you use the `-d` option, the Boolean value is 1, so the value will be displayed in database units. If you do not specify the `-d` option, the Boolean value is 0, the default. *Default*: Specifies values in user units, in microns
`-globalPt` *globalPts*	Specifies the global coordinates to convert into local coordinates.
`-hInst`	Specifies the hierarchical instance of a database object. This option is mandatory.
`-inst` *instPtr*	Specifies a pointer to a specific instance/bump of a cell in the design.The software derives the coordinates and the orientation for the cell instance from the design.
`-localPt` *list*	Specifies the local coordinates to convert into global coordinates
`-orient` *orientEnum*	Specifies the orientation of the cell specified with `-cell`. You must specify the `-cell` and `-pt` parameters with `-orient`. Valid orientation values are: `R0`, `R180`, `R90`, `R270`, `MY`, `MX`, `MX90`, `MY90`.
`-pt` *x y*	Specifies the coordinates for the cell specified with `-cell`. You must specify the `-cell` and `-orient` parameters with `-pt`.

Examples

- Assume that a shape exists on `1` within a NAND2 cell, from (`1 1`) to (`2 2`). If an instance of the NAND2 cell is placed at (`10 10`), with an `R0` (N) orientation, the following command converts the local points (`1 1 2 2`) of the NAND2 cell into their global coordinates:
  ```
  dbTransform -cell [dbGet -p head.allCells.name NAND2] -pt {10 10} -orient R0 -localPt {1 1 2 2}
  ```
  The software returns the following information:
  ```
  {11 11 12 12}
  ```
- Following is an example with the same scenario as above, except that the orientation is MX instead of R0:
  ```
  dbTransform -cell [dbGet -p head.allCells.name NAND2] -pt {10 10} -orient MX -localPt {1 1 2 2}
  ```
  The software takes into account the orientation of the cell and returns:
  ```
  {11 13.04 12 14.04}
  ```
- Assume that the NAND2 cell is placed at (`10 10`), with an `R0` (N) orientation named `i1`. The following command converts the local points (`1 1 2 2`) of `i1` into their equivalent global coordinates:
  ```
  dbTransform -inst [dbGet -p top.insts.name i1] -localPt {1 1 2 2}
  ```
  The software returns the following information:
  ```
  {11 11 12 12}
  ```

dbu2uu

```
dbu2uu
[help]
value
[-unit {100 | 200 | 400 | 800 | 1000 | 2000 | 4000 | 8000 | 10000 | 20000}]
```

Takes an arbitrary list of values and returns it in the same form, with each database integer value converted to its user unit floating point equivalent.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `dbu2uu` parameter. For a detailed description of the command and all its parameters, use the man command: `man dbu2uu`
`-unit` *number*	Specifies the convert factor by which to divide the database integer value. This is an optional parameter. *Value:* One of `100`, `200`, `1000`, `2000`, `10000`, or `20000` *Default:* Uses the LEF `UNITS DATABASE MICRONS` value from the Innovus database technology file, or the OpenAccess equivalent.
{*value* | {*value_list*}}	
	Specifies the value or value list to convert. You can specify a single value, or an arbitrary list of values, including points, rectangles and coordinates. This is a mandatory parameter. *Type:* Integer

Examples

- The following command converts the database value `100` into its equivalent user unit value, based on a convert factor of `2000`:
  ```
  dbu2uu -unit 2000 100
  ```
  The software returns the following information:
  ```
  0.050
  ```
- The following command converts the database values for the list of numbers {1000 1000 2000 2000} into their equivalent user unit values, based on a convert factor of `1000`:
  ```
  dbu2uu -unit 1000 {1000 1000 2000 2000}
  ```
  The software returns the following information for the list of numbers. The list is implied, but not shown.
  ```
  1.000 1.000 2.000 2.000
  ```
- The following command converts the database value of the equivalent user unit value using the database units of the loaded database (`2000` in this example):
  ```
  dbu2uu 2
  ```
  The output of this command is:
  ```
  0.0010
  ```
  Post running the above command, the following command returns the database units of the loaded database as `2000`:
  ```
  dbget head.dbUnits
  ```

Related Commands

`uu2dbu`

decompress_special

```
decompress_special
[-help]
[-area {x1 y1 x2 y2}]
[-layers layer+]
[-nets net+]
```

Decompresses Power-Grid (PG) objects within the specified area, layer, or net. This command decompresses only the overlapped part in case of partial overlapping. The rest of the part is regrouped.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `decompress_special` parameter. For a detailed description of the command and all its parameters, use the man command: `man decompress_special`
`-area {x1 y1 x2 y2}`	Specifies the coordinates for the area from which PG needs to be decompressed. The `decompress_special` command decompresses only those special wires and special vias, which exist within the area specified by this parameter. *Default*: All PG structures are decompressed.
`-layers layer+`	Specifies the layers on which PG decompression is needed. This parameter requires either LEF layer names or a routing layer index value (for example, `1` for the first routing layer, `2` for the second routing layer, and so on).
`-nets net+`	Specifies the nets from which PG decompression is needed.

Example

The following command decompresses `%s special_wires` and `%s special_vias`:

```
decompress_special -area {100 100 120 120} -layer Via56
```

`compress_special`

delete_cell_obs

```
delete_cell_obs
[-help]
-cells {base_cell | design | module}+
{-obs_shapes shape+ | [{-rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}...} | -polygon {x1 y1 x2 y2 x3 y3 ...}] -layers layer+}
```

Helps in deleting an obstruction geometry or library obstruction for a cell on the specified layer. This command deletes the obstruction geometry added by the `add_cell_obs` command or library obstruction (`SPACING 0 OBS`).

Parameters

`-help`	Prints a brief description that includes the type and default information for each `delete_cell_obs` parameter. For a detailed description of the command and all its parameters, use the man command: `man delete_cell_obs`
`-cells {base_cell | design | module}+`	Specifies the cell name or pointer.
`-layers layer+`	Specifies the layer name or pointer.
`-obs_shapes shape+`	Specifies the cell obstruction shape pointers. **Note:** This parameter must be used with the `-cells` parameter, and cannot be specified with any other parameter except than `-help`.
`-polygon {x1 y1 x2 y2 x3 y3 ...}`	Specifies the polygon shape.
`-rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}...}`	Specifies the Obs rect list for deleting obstruction geometries.

Examples

Following is an example of using the `-obs_shapes` parameter for specifying the cell obstruction shape pointer:

- The `BUFX1` cell has multiple obs shapes on different layers:
  ```
  dbget [dbget top.insts.cell.name BUFX1 -p].allObstructions.shapes
  0x7fd9ee9941e0 0x7fd9ee9941c0 0x7fd9ee9941a0 0x7fd9ee994180 0x7fd9ee994160
  ```
- The following command deletes the first two shapes in the list:
  ```
  delete_cell_obs -obs_shapes {0x7fd9ee9941e0 0x7fd9ee9941c0} -cells BUFX1
  ```

Related Topics

`add_cell_obs`

deleteDanglingNet

```
 deleteDangingNet
[-help]
[-hinst string]
```

The `deleteDanglingNet` command deletes all the nets with zero terms except for assign nets and p/g nets. It supports zero-term net deletion in multiple instantiated cells.
This command takes no parameters and can be used whenever the design is read in.

After the command is executed, it reports the following:

- Total number of dangling nets `nrDnet`
- Total number of deleted dangling nets `nrDdnet`
- Total number of nets `ntNet`
- Ratio of `nrDdnet` over `nrNet`
- Ratio of `nrDnet` over `nrNet`
- `nrDdnet` over `nrDnet`

Parameters

`-help`	Prints a brief description that includes the type and default information for each `deleteDanglingNet` parameter. For a detailed description of the command and all its parameters, use the man command: `man deleteDanglingNet`
`-hinst string`	Specifies the name of hierarchical instance for allowing floating/dangling net being deleted within a specific module.

free_memory_of_compressed_objects

```
free_memory_of_compressed_objects
[-help]
```

Releases all the excess memory used by `dbGet`. When the `dbGet` command is used to query `sWire` or `sVia` under the compressed PG mode, it causes increased memory usage. This is because fake objects are created rapidly, but those cannot be released automatically. The `free_memory_of_compressed_objects` command is used to release such fake objects and to free such occupied memory for the user. Hence, the command reduces memory consumption caused by `dbGet` in the compressed PG mode.

Note: The object pointer released through this command becomes invalid and cannot be queried.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `free_memory_of_compressed_objects` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man free_memory_of_compressed_objects`

Related Information

`dbGet`

get_via_pillars

```
get_via_pillars
[-help]
{[-term term [-required]] | -instterm instterm}
```

The command returns a via pillar list on a cell pin.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `get_via_pillars` parameter. For a detailed description of the command and all its parameters, use the man command: `man get_via_pillars`
`-instterm instterm`	Specifies the `InstTerm` name or pointer.
`-required`	Returns the required flag.
`-term term`	Specifies the `Term` name (cell name/term base_name) or pointer.

Related Information

`set_via_pillars`

getDbGetMode

```
  getDbGetMode
[-help]
[-displayFormat]
[-displayLimit]
[-escapeBusChar]
[-nonDefault]
[-quiet]
```

Displays the following information about a `setDbGetMode` parameter in the Innovus log file and in the Innovus console.

- Parameter name
- Current value
- Type (Boolean, string, and so on)
- Whether the current value was set by user

If you do not specify a parameter, the software displays information for all of the `setDbGetMode` parameters.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `getDbGetMode` parameter. For a detailed description of the command and all its parameters, use the man command: `getDbGetMode`
`-displayFormat {simple | table}`	Determines whether to output the results of a `.??` query as a simple list, or in a table. *Default:* `simple`
`-displayLimit value`	Specifies the maximum number of objects, or object attributes to display in the output for a `.??` query. *Default:* `10`
`-escapeBusChar`	Specifies if bus characters must be escaped or not.
`-nonDefault`	Displays the current non-default settings.
`-quiet`	Displays the current settings for the specified parameters in Tcl list format only. If you specify `-quiet` without any parameters, the software displays the current settings of all `setDbGetMode` parameters in Tcl list format.

Examples

- The following command displays the current setting of the `-displayFormat` parameter:
  ```
  getDbGetMode -displayFormat
  ```
  The software displays the following information:
  ```
  -displayFormat simple # enums={simple table}, default=simple
  simple
  ```
- The following command displays the current settings for all `setDbGetMode` parameters:
  ```
  getDbGetMode
  ```
  The software displays the following information:
  ```
  -displayFormat simple # enums={simple table}, default=simple
  -displayLimit 10 # int, default=10
  {displayFormat simple} {displayLimit 10}
  ```
- The following command displays the current setting of the `-displayFormat` parameter in Tcl list only:
  ```
  getDbGetMode -displayFormat -quiet
  ```
  The software displays the following information:
  ```
  simple
  ```
- The following command displays the current settings for all `setDbGetMode` parameters in Tcl list format only:

```
getDbGetMode -quiet
```

The software displays the following information:

```
{displayFormat simple} {displayLimit 10}
```

globalNetConnect

```
globalNetConnect
[-help]
globalNetName
{{-type pgpin -pin pinNamePattern |
-type tiehi [-pin pinNamePattern ] |
-type tielo [-pin pinNamePattern ]}
{{-singleInstance | -singleInst | -sinst} instName |
[{-instanceBasename | -instBasename} instBasenamePattern ]
[{-hierarchicalInstance | -hierInst | -module} hierInstName |
-region llx lly urx ury |
-powerDomain powerDomainName | -all]} |
-type net -net netBasenamePattern
[{-hierarchicalInstance | -hierInst | -module} hierInstName |
-powerDomain powerDomainName | -all]}
[-override]
[-verbose]
[-autoTie]
[-disconnect]
[-netlistOverride]
[-nonHierarchical]
```

The `globalNetConnect` command connects PG pins or 1'b0/1'b1 pins to the specified global net, which is either a power or ground net. You can use the command in the following three scenarios:

- Connecting pins in a single instance.
- Connecting pins in multiple instances.
- Moving connections on a net to the specified global net, which is typically higher in the design hierarchy.

Use the following command to report global nets of the complete design:

```
writeFplanScript -sections {globalNetConnect}
```

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `globalNetConnect` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man globalNetConnect`
`-all`	Applies the global net connection to all instances in the design.
`-autoTie`	Support supply/ground sensitivity. In a command for PG-pin connections, the option can only be specified together with `-type pgpin`. In addition to connecting power pin VDD to global net VDD for each instance, all the instance tie-high pins whose related power pin (as specified in CPF, .lib, or LEF) is VDD, will automatically be tied to global net VDD. For example, `globalNetConnect VDD -type pgpin -pin VDD -autoTie`
`-disconnect`	Disconnect p/g net connection. The option works only with `-sinst`, `-type pgpin` and `-pin` options. **Note:** This option is mutually exclusive with `globalNetName` argument.
`globalNetName`	Specifies the name of the global net to which the specified pins are connected.
`-hierarchicalInstance` *`hierInstName`*	
	Applies the global net connection to instances under *`hierInstName`*. Only the pins of the instances or the local nets under the specified module or hierarchical instance are connected. This parameter is mutually exclusive with the `-region` parameter. **Note:** You can also use the following spelling variations for this argument: • `-hierInst` • `-module`
`-instanceBasename` *`instBasenamePattern`*	
	Specifies the names of leaf instances for which pins are to be connected to the global net. You can use the wildcard (`*`) character to specify a pattern of instance basenames. An instance basename cannot contain the "`/`" character. This parameter is used in conjunction with the `-type pgpin` parameter, or with the `-type tiehi` or `-type tielo` parameters. **Note:** You can also use the `-instBasename` spelling variations for this argument.
`-net` *`netBaseName`*	Specifies the basenames of nets to connect to the global net. Use the wildcard (`*`) character to specify a pattern of net basenames. A net basename cannot contain the "`/`" character. This parameter is used in conjunction with the `-type net` parameter. **Note:** When this parameter is used without the `-hierarchicalInstance` parameter, the `globalNetConnect` command uses the top hinst (top Verilog module), by default.
`-netlistOverride`	Overrides previous global net connections. The option is similar to the option `-override`. However, in addition to overriding previous global net connections, `-netlistOverride` also overrides netlist-specified P/G-pin connections if applicable, which the option `-override` can't do.
`-nonHierarchical`	Connections are made only for instances in the specified hierarchical instance, and not those in its descendant hierarchical instances. The option is of type boolean and is optional.
`-override`	Specifies that the values that used with the `globalNetConnect` command override global net connection values that have been set previously.
`-pin` *`pinNamePattern`*	Specifies the pins to connect to the global net. You can use the wildcard (`*`) character to specify a pattern of pin names. This parameter is used in conjunction with the `-type pgpin` parameter, or optionally with the `-type tiehi` or `-type tielo` parameters.
`-powerDomain` *`powerDomainName`*	
	Applies the global net connection to instances within the specified power domain.
`-region` *`llx lly urx ury`*	

	Applies the global net connection to instances inside the specified region. The region is specified by the x and y coordinates of the lower left and upper right boundary. This parameter is mutually exclusive with the `-module` parameter.
`-singleInstance` *instName*	
	Connects pins in a single instance to a global net. `-singleInstance` is the instance's complete hierarchical name, without any wildcard characters. Use this parameter at the Floorplanning stage, while saving the FPlan file (or saveDesign). ⓘ The `-singleInstance` global net connect rule information is not saved in the *.fp file, but in the *.pg file. **Note:** You can also use the following spelling variations for this argument: • `-sinst` • `-singleInst`
`-type {net | pgpin | tielo | tiehi}`	
	Specifies the type of connection to be made to the global net. Use one of the following values: • `net`: Specifies that the pins connected to nets listed with the -net parameter are to be moved to the specified global net. • `pgpin`: Specifies that the power and ground pins listed with the `-pin` parameter are to be connected. • `tielo`: Specifies that tie low (`1'b0`) pins be connected. Before `tielo` net is assigned, no actual net is connected to the tie low pin. • `tiehi`: Specifies that tie high (`1'b1`) pins be connected. Before `tiehi` net is assigned, no actual net is connected to the tie high pin.
`-verbose`	Specifies that connection statistics and warning messages are displayed in the console. This parameter can be useful during troubleshooting.

Examples

- The following command connects the `vss` pin of all instances to `vss`:
  ```
  globalNetConnect VSS -type pgpin -pin VSS
  ```
- The following command moves all `vdd!` connections under `u1/u2` to `VDD`:
  ```
  globalNetConnect VDD -type net -hierInst u1/u2 -net vdd!
  ```
  Note: You can also ignore polarity checking during `globalNetConnect` and CPF/IEEE1801 operations through the global variable `init_ignore_pgpin_polarity_check` that allows USE POWER pin to be connected to a USE GROUND net (or vice versa).
- The following example shows how the power and ground nets are defined in the .globals file, and while importing the design data, the same .globals file is loaded:
  ```
  set init_pwr_net {VDD PWRD PWRA PWRIO}
  set init_gnd_net {VSS GNDD GNDA GNDIO}
  ```
- The following example presents how to remove all the power and ground net connections from the Innovus database:
  ```
  clearGlobalNets
  # For instances or standard cells where LEF pin name is vdd! for power and gnd! for ground, the net names VDD and GND should have been already defined as power and ground net.
  globalNetConnect VDD -type pgpin -pin vdd! -all
  globalNetConnect GND -type pgpin -pin gnd! -all
  # For tie pin connections to power and ground, the net names VDD and VSS should have been already defined as power and ground nets.In below case, tiehi/tielo pins are directly assigned to the VDD/VSS nets.
  globalNetConnect VDD -type tiehi
  globalNetConnect VSS -type tielo
  Note: The addTieHiLo command overrides the above direct connection.
  # For macro single instance U1/rom1 as example making power and ground pin connections to power and ground net, the net names PWRD GNDD PWRA and GNDA should have been already defined as power and ground nets.
  globalNetConnect PWRD -type pgpin -pin DIGPWR -sinst U1/rom1 -override
  globalNetConnect GNDD -type pgpin -pin DIGGRND -sinst U1/rom1 -override
  globalNetConnect GNDA -type pgpin -pin AGND -sinst U1/rom1 -override
  globalNetConnect PWRA -type pgpin -pin AVDD -sinst U1/rom1 -override
  globalNetConnect GNDA -type pgpin -pin AVSS -sinst U1/rom1 -override
  # For IO PAD single instance iopad_ring/RT5 making power and ground pin connections to power and ground net, the net names PWRD GNDD PWRIO and GNDIO should have been already defined as power and ground nets.
  globalNetConnect PWRD -type pgpin -pin VDD -sinst iopad_ring/RT5 -override
  globalNetConnect GNDD -type pgpin -pin VSS -sinst iopad_ring/RT5 -override
  globalNetConnect PWRIO -type pgpin -pin VDDIO -sinst iopad_ring/RT5 -override
  globalNetConnect GNDIO -type pgpin -pin VSSIO -sinst iopad_ring/RT5 -override
  ```
- The following example presents how to disconnect and reconnect the existing glbalNetConnection for specific instances (such as `eng/ext_mgnt/dram1_sram/s1ram/sram_100` and `eng/ext_mgmt/vpp_sram/sram/sram_070`):
  ```
  globalNetConnect -disconnect -pin VDD -type pgpin -singleInstance eng/ext_mgnt/dram1_sram/s1ram/sram_100
  globalNetConnect VDD_BLOCK -pin VDD -type pgpin -singleInstance engine/ext_mgnt/dram1_sram/s1ram/sram_100
  globalNetConnect -disconnect -pin VDD -type pgpin -singleInstance eng/ext_mgmt/vpp_sram/sram/sram_070
  globalNetConnect VDD_BLOCK -pin VDD -type pgpin -singleInstance eng/ext_mgmt/vpp_sram/sram/sram_070
  ```
- The following commands connect VDD pins of instances that match `Module_LVT/p*` to VDDL, VDD pins of instances that match `Module_HVT/r*` to VDDH, and VDD pins of instances that match `Module_RVT/*` to VDDR. (note that it is needed to specify hierarchical instance name to `-module`, and not module name):
  ```
  globalNetConnect VDDL -type pgpin -pin VDD -instBasename p* -module Module_LVT -verbose
  globalNetConnect VDDH -type pgpin -pin VDD -instinstBasename r* -module Module_HVT -verbose
  globalNetConnect VDDR -type pgpin -pin VDD -module Module_RVT -verbose
  ```

Related Topics

- `writeFplanScript`

report_metal_stack

```
report_metal_stack
[-help]
[-non_preferred_direction]
```

Reports the metal stack configuration and routing track information. For each routing layer, this includes the layer name, preferred routing direction, routing offset (offset of routing track from 0), routing pitch (space between each routing track), min-width DRC rule, min-spacing DRC rule, and the routing default-width (wire width of the default routing rule). Note that for a horizontal direction track, the offset and pitch are in the Y direction (for example, the Y offset from 0, and the Y pitch of horizontal tracks). This command only supports uniform track-patterns with a single pitch value, and will not report non-uniform pitch routing track patterns that can be created with add_tracks or create_tracks.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `report_metal_stack` parameters. For a detailed description of the command and all its parameters, use: `man report_metal_stack`
`-non_preferred_direction`	By default, the `report_metal_stack` command displays the metal stack and routing information only related to the preferred routing direction. When the `-non_preferred_direction` parameter is used, the information related to the non-preferred routing direction is displayed.

Examples

- The following command displays the metal stack and routing information:
  `report_metal_stack`

  The following is the output of the above command:

```

```

report_net_wires

```
report_net_wires
[-help]
[-file fileName]
[-net netName]
```

Displays information about the regular net wires. If the `-net` parameter of this command is not specified, the wires of all the nets are displayed. If the `-file` parameter of this command is not specified,, the wire information on the screen (console) and log file are displayed. The information about the net regular wires is categorized as:

- Node Information
- Edge Information

Node Information

It includes XY location (like `Loc=(2.3, 52.11)`), metal layer (like `Layer=M1(2)`), number of edges on the current node (like `Edges=2`), tie special node name (like `Tie Special`), and global route node name (like `Global Route`). If the node has a terminal attached, the node information also includes the term information, like `Term = a/b/c`, `IO Pin = name`, or `PG Term = x/y/z`.

Edge Information

It includes node number (like `Node3 -> Node5`), edge type (like `Type=HV Wire`), and edge status (like `Status=Routed`). The edge status list includes `None`, `Routed`, `Fixed`, `Cover`, `Shield`, `No Shield`, `Global`, `Assigned`. For different edge types, the edge information reports different edge attributes. Following is the list of various edge types and their attributes:

- `HV Wire:`
  `NDR=name` (non-default rule name)
  `Width=3.3` (wire width)
  `Begin Extension=3.3` (wire beginning extension)
  `End Extension=3.3` (wire ending extension)
  `Mask=1` (color/mask value)
- `Via:`
  `Via Cell=name` (via cell name)
  `NDR=name` (non-default rule name)
  `Top Mask=1` (top metal layer's color/mask value)
  `Cut Mask=1` (cut layer's color/mask value)
  `Bottom Mask=1` (bottom metal layer's color/mask value)
- `Patch:`
  `Box=(100.0,200.0,223.6,250.4)` (patch box coordinates)
  `Mask=1` (patch color/mask value)
  `Attr=304` (patch attributes value)
  If it is a non-routing patch, it will also report trim metal information as shown below:
  `Trim Metal Box=(10.0, 10.0, 11.9, 11.9)` (trim metal box coordinates)
  `Mask=1` (trim metal color/mask value)
  `Layer=name` (trim metal layer name)
- `45 Degree:`
  `NDR=name` (non-default rule name)
  `Width=3.3` (wire width)
  `Mask=1` (color/mask value)
- `Zero Length`
- `Term Connect`
- `Virtual:`
  `Zero Length`, `Term Connect`, and `Virtual` have no extra attribute information. Following is an example of a single net:
  Wires for the `net1` net:
  `Node0: Loc=(44.102, 55.203), Layer=PO(2), Edges=1, Global Route`
  `Term = inst1/b`

```
Node1: Loc=(44.102, 66.304), Layer=Po(2), Edges=1
IO Pin = net1
Edge0: (Node0->Node1), Type=HV Wire, Status=Routed, NDR=ndr1, Width=0.056, Begin Extension=0.056, End Extension=0.056, Mask=1
```

Parameters

`-help`	Prints a brief description that includes the type and default information for each `report_net_wires` parameter. For a detailed description of the command and all its parameters, use the man command: `man report_net_wires`
`-file` *`fileName`*	Specifies the name of the file.
`-net` *`netName`*	Specifies the name of the net.

report_preserves

```
report_preserves
[-help]
[-computed]
[-obj_type {design | hinst | module | inst | net | hnet | pin | hpin | base_cell}]
[-dont_touch | -dont_use]
```

By default, this command displays all the preserves that affect optimization set in the library. This includes all the `.dont_touch*`, `.read_only*`, `.is_ilm`, `.dont_use*`, and `.use_cells` attributes that have a non-default value. The command does not show the computed attributes that include inheritance from their parents such as `.dont_touch_effective`, `.dont_use_cells_effective`, `dont_touch_sources`, or `.read_only_effective` to make it easy to see exactly what objects were set in the library (see `-computed` to include them).

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `report_preserves` parameter. For a detailed description of the command and all its parameters, use the man command: `man report_preserves`
`-computed`	Includes computed inheritance attributes such as `.dont_touch_effective`, `.dont_touch_sources`, `.read_only_effective`, and `.dont_use_cells_effective` attributes in the report (unless filtered by `-dont_touch` or `-dont_use`). This causes all objects to inherit a non-default value from a parent or the library to appear in the report.
`-obj_type {design | hinst | module | inst | net | hnet | pin | hpin | base_cell}`	Displays the report only on specific object types.
`-dont_touch`	Displays the report only related to `dont_touch`: `.dont_touch*`, `.read_only*`, and `is_ilm`.
`-dont_use`	Displays the report only related to `dont_use`: `.dont_use_cells*` and `.use_cells*`.

Examples

Example 1

```
dbSet [dbGet -p top.hInst.allInsts.name TDSP_CORE_INST].dontTouch sizeOk
```

Queries all hinsts

```
report_preserve -obj_type hinst -dont_touch
```

```

```

3 hinsts constrained.

report_via

```
report_via
[-help]
[-detail]
[-regular]
[-special]
```

Reports the single and multi-cut via summary for special and/or regular vias. Such a summary could be used for generating statistics regarding the usage of single and multi-cut used vias.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `report_via` parameter. For a detailed description of the command and all its parameters, use the man command: `man report_via`
`-detail`	Prints the detailed report related to every via.
`-regular`	Prints the report related to regular routing vias.
`-special`	Prints the report related to special routing vias.

Examples

Use the following command to display a detailed report related to every via:

```
report_via -detail
# Via-def                                  Layer(cut)     Single-cut     Total
#-------------------------------------------------------------------------------
# VIA1_20_7_20_7_VxaRECT_V                      VIA1       0            29733
# VIA1_20_7_20_7_VxaRECT_N                      VIA1       0            21322
# VIA1_20_7_20_7_VxaRECT_S                      VIA1       0            19468
# VIA1_20_7_7_20_VxaRECT_V                      VIA1       0             1266
# VIA1_0_25_0_25_VxaRECT_N49                    VIA1       0           152109
# VIA1_0_25_0_25_VxaRECT_S49                    VIA1       0           188660
...
#-------------------------------------------------------------------------------
# Total                                                                10149027
```

Use the following command to display a report about regular routing vias, including single and multi-cut vias number (ratio):

```
report_via -regular
# Layer(cut)              Single-cut               Multi-cut          Total
#-------------------------------------------------------------------------------
# VIA1              1872843 ( 74.2%)         649834 ( 25.8%)        2522677
# VIA2              1514819 ( 48.1%)        1632913 ( 51.9%)        3147732
# VIA3               914028 ( 50.4%)         900507 ( 49.6%)        1814535
# VIA4               514637 ( 47.1%)         578552 ( 52.9%)        1093189
# VIA5               203532 ( 40.2%)         302433 ( 59.8%)         505965
# VIA6                69496 ( 28.5%)         174355 ( 71.5%)         243851
# VIA7                11181 ( 13.9%)          69227 ( 86.1%)          80408
# VIA8                 4634 ( 10.1%)          41441 ( 89.9%)          46075
#-------------------------------------------------------------------------------
# Total             5105170 ( 54.0%)        4349262 ( 46.0%)        9454432
```

reportDanglingNet

```
 reportDanglingNet
[-help]
[-outfile fileName]
```

Reports the number of nets with zero terms, including the PG nets. This command can also be used to report the number of dangling nets, which could or could not be removed by the `deleteDanglingNet` command. The command reports the following information, when used:

- Total number of nets
- Number of dangling nets
- Number of removable dangling nets
- Number of non-removable dangling nets

The removable and non-removable nets are reported based on the usage of the `deleteDanglingNet` command. Those dangling nets, which could not be removed by the `deleteDanglingNet` command, are reported in the output file due to multiple possible reasons, such as the dangling net:

- The dangling net is a physical net.
- The dangling net is a PG net.
- The dangling net is a bus bit net.
- The dangling net is an assign net.
- The dangling net has multiple module ports and at least one port is associated with some constraints.
- The dangling net itself has some constraints, like an ILM module or some timing constraints.

Note: If a dangling net cannot be deleted due to any reason, only the first reason listed above will be reported in the output file.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `reportDanglingNet` parameter. For a detailed description of the command and all its parameters, use the man command: `man reportDanglingNet`
`-outfile fileName`	Reports the list of dangling nets that cannot be deleted by the `delete_floating_nets` command, along with its reasons.

Examples

- The following command reports the information about the nets listed in the `danglingnet.rpt` file:

```
reportDanglingNet -outfile danglingnet.rpt
```

- Following is the output of the above command:

```
#############################################################

#  Generated by:      Cadence Innovus 19.10-p002_1

#  OS:                Linux x86_64(Host ID sjfsb473)

#  Generated on:      Sat Aug 18 11:14:18 2018

#  Design:            designName

#  Command:           reportDanglingNet -outfile danglingNet.rpt

#############################################################
Total number of nets: 123456

The number of dangling nets: 26

Removable dangling nets: 22

Non-removable dangling nets: 4

   Is physical net: 2

   Is P/G net: 0

   Is bus net: 1

   Is assign net: 0

   Has module port:0

   Has constraints: 1
Reasons for the net not being removed:

Net <name> is physical net

Net <name> is physical net

Net <name> is bus net

Net <name> has constraints
```

reportRC

```
reportRC
[-help]
fileName
[-inst string]
[-layer string]
[-max_second_rc float]
```

Calculates the first and second RC values. The first RC value is the longest continuous vertical `rx` cut for a cell, where:

- Rx cut is always in the left or right boundaries of the cell, and at times in the internal cell.
- It is the longest vertical bar (number of rows) in which the cell's `rx` cut participate in.
- Multiple-height cells contribute the rows of height.

The second RC value is the largest distance (in microns) from the left or right boundary of the cell to the second `rx` cut in the left and right directions.

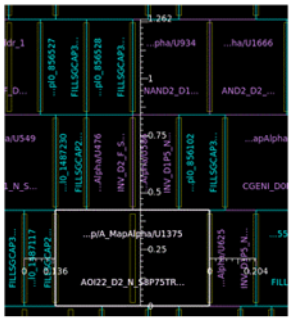
Parameters

`-help`	Prints a brief description that includes the type and default information for each `reportRC` parameter. For a detailed description of the command and all its parameters, use the man command: `man reportRC`
`fileName`	Specifies the report filename. **Note:** The report filename must be specified. Else, the software will display error message `IMPTCM-46`.
`-inst` *`string`*	Specifies the distance from inst to report.
`-layer` *`string`*	Specifies the layer of obs to calculate.
`-max_second_rc` *`float`*	Specifies the maximum distance to calculate the second RC. *Default*: `2`

Examples

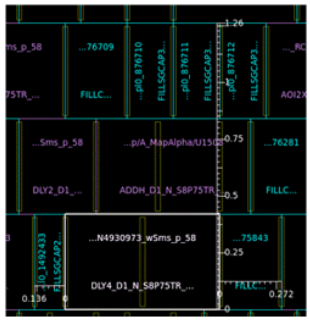
Refer to the following examples:

Example 1: STD Cell 1

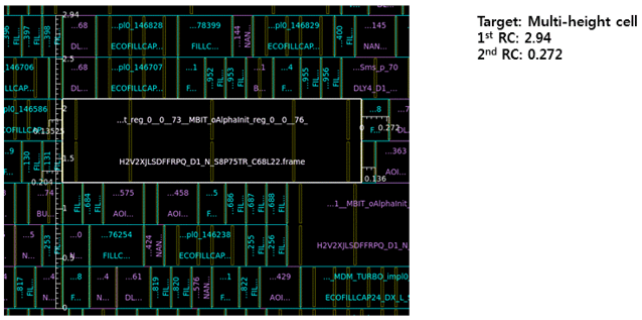


STD cell: AOI22
1st RC: 1.262
2nd RC: 0.204

Example 2: STD Cell 2



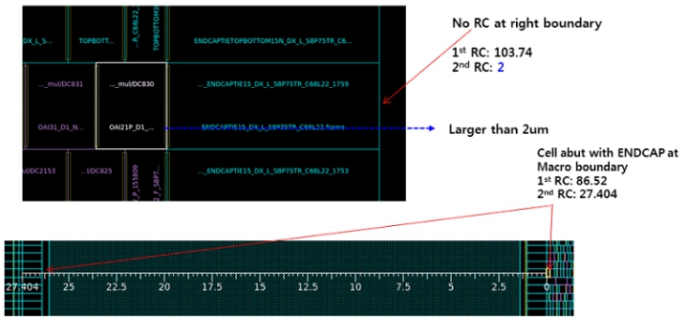
Example 3: Special Cells (Multi-height)



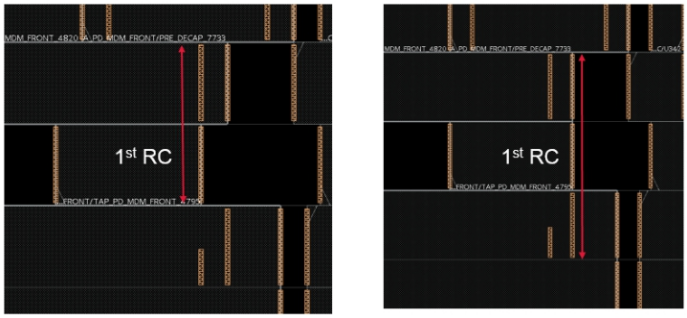
Example 4: Special Cells (ENDCAP)

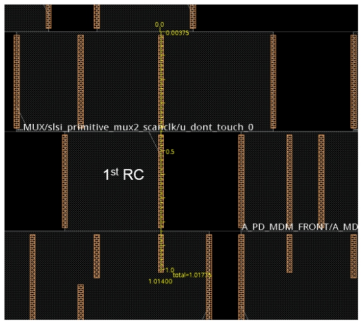
Note that:

- An ENDCAP cell has a single RC.
- The cell with ENDCAP must have a long second RC.
- The second RC effect is saturated at 2um. It means that the second RC value for the cell is 2 um.

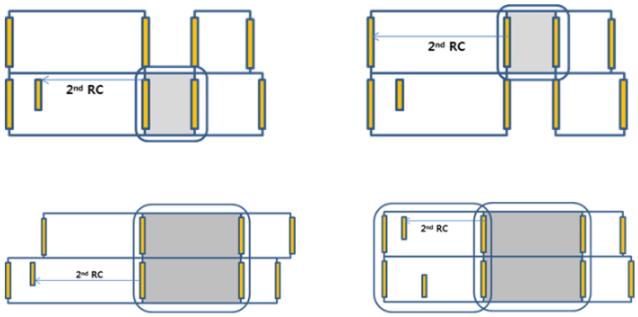


Example 5: First RC Values in Various Scenarios





Example 6: Second RC Values in Various Scenarios



Example 7: Input/Output Format of First and Second RC Generation

```
derive_rxcuts {

```

reportWirePath

```
reportWirePath
[-help]
[-detail]
-end string
[-include_pin]
-start string
[-tcl [-no_output]]
```

Extracts the routing topology report in a point-to-point manner (for example between routing layer, wire length, via, resistor, and capacitance). The report contains the information such as timing path for each via, wire length, and width of path.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `reportWirePath` parameter. For a detailed description of the command and all its parameters, use the man command: `man reportWirePath`
`-detail`	Prints the detailed information related to the path.
`-end string`	Specifies the end terminal name, which can be an `instTerm`, `term`, `hinstTerm`, and `hTerm`.
`-include_pin`	Specifies whether to include pin in the report.
`-no_output`	Specifies whether to print the path when `-tcl` is used.
`-start string`	Specifies the start terminal name, which can be an `instTerm`, `term`, `hinstTerm`, and `hTerm`.
`-tcl`	Specifies whether to return the Tcl dict of the wire path.

Examples

Use the following command to get the routing topology report from `inst1/Z` to `inst2/A`:

```
reportWirePath -start inst1/Z -end inst2/A Start pt: 15.075, 6.72 Via NR_VIA1_PH Wire M2, Width: 0.032, Length: 0.01 Via NR_VIA2_PV Wire M3, Width: 0.032, Length: 0.832 Via NR_VIA2_PV Wire M2, Width: 0.032, Length: 0.35 Via NR_VIA1_PH End pt: 15.435, 5.888 Total wire length: 1.192 Manhattan length: 1.192
```

set_via_pillars

```
set_via_pillars
[-help]
{-term term | -instTerm instTerm}
stack_via_rule+
[-required {0 | 1 | 2 | 3 | 4}]
```

This command sets a via pillar list for a cell term or a single via pillar for an `instTerm`.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `set_via_pillars` parameter. For a detailed description of the command and all its parameters, use the man command: `man set_via_pillars`
`-instTerm instTerm`	Specifies the `instTerm` name or pointer. Only one via pillar is allowed for `instTerm`.

`stack_via_rule+`	Provides a list of via pillars for a cell term, or a single via pillar for a `instTerm`. This list further provides the candidates of `instTerm` via pillar setting. On running:
	`set_via_pillars -term BUFX1/Z -required 1 {vp_rule1 vp_rule2}`
	`set_via_pillars` automatically sets the minimal cost via pillar rule for the corresponding `instTerm`, which is `vp_rule1`. You can also set the other via pillar rule to the `instTerm` by running:
	`set_via_pillars -instTerm i1/i2/Y vp_rule2`
	An empty *`stack_via_rule`* will remove the via pillar from `instTerm`:
	`set_via_pillars -instTerm i1/i2/Y -required 1 ""`

`-required {0 | 1 | 2 | 3 | 4}`	Sets the `.stackViaRuleRequied` attribute for the *`term`*/*`instTerm`* values specified by the `-term` or `-instTerm` parameters. Setting the `.stackViaRuleRequied` attribute determines whether the stack vias are required for the specified term. • When set to `0` for a term, this parameter sets the `.stackViaRuleRequied` attribute to `0`, which ignores this `term` for `stackViaRule` checking. If the parameter is set to `0` only for an `instTerm`, other `instTerm` values instantiated from the same `term` will not be affected. • When set to `1` for a `term`, this parameter sets the `.stackViaRuleRequied` attribute to `1` on the `term` values. When set to `1` for an `instTerm`, it enforces the via pillar only on the specified `instTerm`. However, if the via pillar list is empty for an `instTerm`, no via pillar is used even when the required bit is `1`. If set to `1`, the software performs min via pillar insertion with dirty mode, in which the via pillars are added even if there is DRC. • When set to `2` for a `term`, this parameter sets the `.stackViaRuleRequied` attribute to `2` on the `term` values. If set to `2`, the software performs min via pillar insertion with clean mode, in which the via pillars are not added if there is DRC. • When set to `3` for a `term`, this parameter sets the `.stackViaRuleRequied` attribute to `3` on the `term` values. If set to `3`, the software performs multiple tries from large to min via pillar insertion with dirty mode, in which the via pillars are added even if there is DRC. • When set to `4` for a `term`, this parameter sets the `.stackViaRuleRequied` attribute to `4` on the `term` values. If set to `4`, the software performs multiple tries from large to min via pillar insertion with clean mode, in which the via pillars are not added if there is DRC. ⚠ The `2`, `3`, and `4` values of this parameter are applicable only for a `term`.
`-term term`	Specifies the `Term` name (cell name/term base_name) or pointer. A via pillar list is allowed for `term`.

Examples

- Where the cell of `inst i1/i2` and `i1/i3` are both `BUFX1`, the following commands indicate that `instTerm i1/i2/Z` requires a via pillar `M2M4_1X3`:
```
set_via_pillars -term BUFX1/Z -required 1 {M2M4_1X2 M2M4_1X3}
set_via_pillars -instTerm i1/i2/Z -required 1 M2M4_1X3   #The via pillar for instTerm must be on the cell term's via pillar list. Otherwise, a proper ERROR should be returned.
```
- The following command removes the via pillar `M2M4_1X3` from `instTerm i1/i2/Z`:
```
set_via_pillars -instTerm i1/i2/Z "" -required 1
```
- The following command sets a via pillar list on a cell pin:
```
set_via_pillars -term BUFX1/Z -required 1 {M2M4_1X2 M2M4_1X3}
```
- The following command sets a via pillar with via pillar list of the corresponding cell pin on a `instTerm`; the cell of inst `i1/i2` is `BUFX1`:
```
set_via_pillars -instTerm i1/i2/Z M2M4_1X3
```
- The following command sets via pillar to cell pin `AN2_NOM_D16*/Z`:
```
foreach cell [dbGet head.libCells.name -e AN2_NOM_D16*] {set_via_pillars -term $cell/Z -required 0 {VPPERF_M2_M4_1_2_1 VPPERF_M2_M5_1_2_2_1 VPPERF_M2_M9_1_2_2_2_2_2_2_1} }
```

Related Information

`get_via_pillars`

setDbGetMode

```
setDbGetMode
[-help]
[-reset]
[-displayFormat {simple | table}]
[-displayLimit value]
[-escapeBusChar {true | false}]
```

Controls certain aspects of how the dbGet command displays object information.

Use the getDbGetMode command to display the current settings for the `setDbGetMode` command.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `setDbGetMode` parameter. For a detailed description of the command and all its parameters, use the man command: `setDbGetMode`
`-displayFormat {simple | table}`	
	Determines whether to output the results of a `.??` query as a simple list, or in a table. *Default:* `simple`
`-displayLimit value`	Specifies the maximum number of objects, or object attributes to display in the output for a `.??` query. *Default:* `10`
`-escapeBusChar {true | false}`	
	Indicates whether bus characters will be escaped using {} or not. Use the option to avoid braces when command displays object information. *Default*: `true` (will escape names containing bus characters)
`-reset`	Resets parameters to their default values. The `-reset` parameter *must* be the first parameter specified. If you specify `-reset` by itself, the software resets all `setDbGetMode` parameters to their default values. If you specify parameters after `-reset`, the software resets only those parameters to their default values. Any values that do not already match the default value and are reset, will be reported.

Examples

- The following command instructs the `dbGet` command to output the results of a `.??` query as a table.

  ```
  setDbGetMode -displayformat table
  ```

  Query results are displayed in the following format:

  ```
  attribute/object | value
  --------------------------------------------------------------------------------
  box | {0 0 1.32 5.04}
  cell | 0x121ede48
  instTerms | 0x13450290 0x134502c4
  isDontTouch | 0
  isHaloBlock | 0
  isJtagElem | 0
  isPhysOnly | 0
  isSpareGate | 0
  name | IOPADS_INST/PKS_Opt_2126
  objType | inst
  orient | R0
  pStatus | unplaced
  pgCellTerms | 0x13a3db98 0x13a3dbdc
  pgTermNets | 0x131aa5c8 0x131aa688
  pt | {0 0}
  ```

- The following command resets the `-displayformat` parameter to its default value:

  ```
  setDbGetMode -reset -displayFormat
  ```

  Query results are displayed in a simple list format:

  ```
  box: {0 0 1.32 5.04}
  cell: 0x121ede48
  instTerms: 0x13450290 0x134502c4
  isDontTouch: 0
  isHaloBlock: 0
  isJtagElem: 0
  isPhysOnly: 0
  isSpareGate: 0
  name: IOPADS_INST/PKS_Opt_2126
  objType : inst
  orient : R0
  pStatus : unplaced
  pgCellTerms: 0x13a3db98 0x13a3dbdc
  pgTermNets: 0x131aa5c8 0x131aa688
  pt: {0 0}
  box: {0 0 1.32 5.04}
  cell: 0x121ede48
  instTerms: 0x134502f8 0x1345032c
  isDontTouch: 0
  isHaloBlock: 0
  isJtagElem: 0
  isPhysOnly: 0
  isSpareGate: 0
  name: IOPADS_INST/PKS_Opt_2125
  objType : inst
  orient : R0
  pStatus : unplaced
  ```

```
pgCellTerms: 0x13a3db98 0x13a3dbdc
pgTermNets: 0x131aa5c8 0x131aa688
pt: {0 0}
```

- The following command resets all `setDbGetMode` parameters to their default values:
  ```
  setDbGetMode -reset
  ```
- The `-escapeBusChar` option can be used as follows:
  ```
  Behaviour with -escapeBusChar option = true (Default):
  dbGet top.nets.name
  net1 {busnet[10]} ...
  Behaviour with -escapeBusChar option = false :
  dbGet top.nets.name
  net1 busnet[10] ...
  ```
- The `-displayLimit` can be used as follows:
  Default behavior (displayLimit is set to `10`) returns maximum of 10 pointers:
  ```
  dbget top.?? nets nets
  0x2ad51a5f4090 0x2ad51a5f40d8 0x2ad51a5f4120 0x2ad51a5f4168 0x2ad51a5f41b0 0x2ad51a5f41f8 0x2ad51a5f4240 0x2ad51a5f4288 0x2ad51a5f42d0
  0x2ad51a5f4318 ... (total length 6467)
  setDbGetMode -displayLimit 2
  ```
  The above command returns maximum of 2 pointers.
  ```
  dbget top.?? nets
  nets: 0x2ad51a5f4090 0x2ad51a5f40d8 ... (total length 6467)
  ```

Related Commands

`getDbGetMode`

uniquify

```
uniquify
[-help]
{[design | module] | -new_master hinsts} [-exclude modules]
[-verbose]
```

Supports regrouping of master-clone partitions inside the non-unique modules. This command uniquifies or regroups the master/clones (one master module used by two or more `hinst` clones) by creating unique modules for each `hinst` clone, as needed. In all the cases, the new module names are generated by appending the '`_number`' suffix (such as `_1` and `_2`) sequentially to the original module name for creating a unique module name.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `uniquify` parameter. For a detailed description of the command and all its parameters, use the man command: `man uniquify`
`design` `|` *`module`*	Regroups the master/clones within the *`design`* or *`module`* and recursively below it. This assures that all the `hinsts` inside those would have their own unique module, except for the modules specified using the `-exclude` parameter. In case multiple `hinsts` are referenced to the specified `module`, those will remain as clones. *Type:* Mandatory
`-new_master` *`hinsts`*	Splits the `hinst` clones of a master module into the clones of a new master. The new master is also regrouped, except for the modules specified using the `-exclude` parameter. It may also happen that one of such `hinst` clones is forced to have a new master (refer to the **Examples** section). In case a `hinst` is not a clone of the same module, an error message is displayed. *Type:* Mandatory
`-exclude` *`modules`*	Excludes the specified modules from unification or regrouping. Use this parameter if a specific sub-module is a partition, which will be implemented and shared only once. *Type:* Optional
`[-verbose]`	Reports the `hinst` clones (if any), which are regrouped. *Type:* Optional

Examples

- The following command uniquifies the whole design, where the `h1`, `h2`, and `h3 hinsts` are clones of the `mod1` module, and the `h4` and `h5 hinsts` (clones of the `mod2` module) are inside `mod1`:
  ```
  uniquify top -verbose
  #hinst name module name
  h1 mod1 (unchanged)
  h2 mod1_1
  h3 mod1_2
  h1/h4 mod2 (unchanged)
  h1/h5 mod2_1
  h2/h4 mod2_2
  h2/h5 mod2_3
  h3/h4 mod2_4
  h3/h5 mod2_5
  ```
  Note that the first clone of each module is not modified. So, `h1` still uses `mod1`, and `h1`/`h4` still use `mod2`. However, these are still reported to see the `hinst` clone, which forces a new module for the other `hinst` clones.
- Using the same scenario as in the previous example, the following command uniquifes the design below `mod1`:
  ```
  uniquify mod1 -verbose
  #hinst name module name
  h1/h4 mod2 (unchanged)
  h1/h5 mod2_1
  h2/h4 mod2 (unchanged)
  h2/h5 mod2_1
  h3/h4 mod2 (unchanged)
  h3/h5 mod2_1
  ```
  Note that only the design inside `mod1` is uniquified. So, `h1`, `h2`, and `h3` are still the clones of `mod1`, and there are still master/clones grouping between `h1`, `h2`, and `h3`. For instance, all the `h4`s use `mod2`, and all the `h5`s use `mod2_1`.
- Using the same scenario as in the first example, the following command splits `h1` and `h2` into a new master. This is normally done, if `h1`, `h2`, and `h3` are partitions and need a different implementation than `h3`. It is recommended not to uniquify `mod2`, if it is a lower-level partition, which will be implemented once and shared by all `h1`, `h2`, and `h3`.
  ```
  uniquify -new_master {h1 h2} -exclude mod2 -verbose
  #hinst name module name
  h1 mod1_1
  h2 mod1_1
  ```
  Note that `h3` is still using `mod1`, and the `mod2 hinsts` inside `mod1` and `mod1_1` (such as `h4` and `h5`) are still the clones of `mod2`. If there is also a `mod3` inside `mod1`, it will also be uniquified, but nothing inside `mod2` is uniquified.
- Using the same scenario as in the first example, the following command splits `h1` and `h4` into a new master. This implicitly forces `h1` to be uniquified from `h2` and `h3`.
  ```
  uniquify -new_master {h1/h4} -verbose
  #hinst name module name
  h1 mod1_1 (forced by lower level change)
  h1/h4 mod2_1
  ```
  If there is a `mod4` inside `mod2_1`, it will also be uniquified, but it will not be shared with `mod2`.

uu2dbu

```
uu2dbu
[help]
value
[-unit {100 | 200 | 1000 | 2000 | 10000 | 20000}]
[-unit number]
{value | {value_list}}
```

Takes an arbitrary list of values and returns it in the same form, with each user unit floating point value converted to its database integer value equivalent.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `uu2dbu` parameter. For a detailed description of the command and all its parameters, use the man command: `man uu2dbu`
`-unit number`	Specifies the convert factor by which to multiply the user unit value. This is an optional parameter. *Value:* One of `100`, `200`, `1000`, `2000`, `10000`, or `20000` Default: Uses the LEF `UNITS DATABASE MICRONS` value from the Innovus database technology file, or the OpenAccess equivalent.
`{value | {value_list}}`	
	Specifies the value or value list to convert. You can specify a single value, or an arbitrary list of values, including points, rectangles and coordinates. This is a mandatory parameter. *Type:* Float

Examples

- The following command converts the user unit value `30` into its equivalent database integer value, based on a convert factor of `2000`:
  ```
  uu2dbu -unit 2000 30
  ```
  The software returns the following information:
  ```
  60000
  ```
- The following command converts the user unit values for the list of numbers {`30 40`} into their equivalent database unit values, based on a convert factor of `200`:
  ```
  uu2dbu -unit 200 {30 40}
  ```
  The software returns the following information for the list of numbers. The list is implied, but not shown.
  ```
  6000 8000
  ```
- The following command converts the value to the database unit value using the database unit of the loaded database:
  ```
  uu2dbu 0.5
  ```
  The output of this command is:
  ```
  1000
  ```
  Post running the above command, the following command returns the database unit value of the loaded database as `2000`:
  ```
  dbget head.dbUnits
  ```
  Note that if the value cannot be converted to an integer database value, an error message will be displayed, as shown below:
  ```
  uu2dbu -unit 2000 0.000005
  **ERROR: (IMPSYC-1295): Cannot convert to integer database unit.
  ```

Related Commands

`dbu2uu`

Basic Database Access Tcl Global Variables

- restore_db_version
- layerNameNoAbbreviation
- mustjoinallports_is_one_pin

restore_db_version

```
restore_db_version string
```

Type: String

Default: `""`

Restores the tool database version that generates the current design. This command was renamed from `dbRestoreDbVersion`.

layerNameNoAbbreviation

```
layerNameNoAbbreviation {0 | 1}
```

Type: Boolean

Default:

- `1` for N7 designs
- `0` for rest all designs

By default `dbGet layer.name` and most command `-layer layer` options allow abbreviations such as M1 and M2, for routing layers such as 1 and 2. If this global variable is set to `1`, `dbGet layer.name` returns the full layer names rather than an abbreviation, and the M1 and M2 abbreviations are not allowed for `-layer` input.

This global is intended to be set when a technology has real layer names like M1, M2, that do not correspond to routing layers 1, 2. Setting this global to 1 will disable the M<num> abbreviations that may cause confusion, and only allow full layer names, or routing layer numbers.

Example

```
dbGet head.layers.extName                  //.extName is full layer name
Metal1 Metal2 Metal3 Metal4 Metal5 Metal6 Via12 Via23 Via34 Via45 Via56 OVERLAP

dbGet head.layers.name                     //.name is abbreviated layer name
M1 M2 M3 M4 M5 M6 Via12 Via23 Via34 Via45 Via56 OVERLAP

add_shape -rect {0 0 5 5} -layer Metal1  //full name works

add_shape -rect {0 0 5 5} -layer M1     //abbreviated name work

add_shape -rect {0 0 5 5} -layer 1      //routing number works

set layerNameNoAbbreviation 1 //set layer name returned with full layer name instead of abbreviation
1

dbGet head.layers.name                     //.name is now full layer name
Metal1 Metal2 Metal3 Metal4 Metal5 Metal6 Via12 Via23 Via34 Via45 Via56 OVERLAP

add_shape -rect {0 0 5 5} -layer Metal1   //full name works

add_shape -rect {0 0 5 5} -layer M1      //abbreviated name fails

**ERROR: (IMPSPR-162): Incorrect usage for command 'add_shape'. Invalid layer name: M1

add_shape -rect {0 0 5 5} -layer 1       //routing number works
```

mustjoinallports_is_one_pin

```
mustjoinallports_is_one_pin {true | false}
```

Type: Boolean

Default: `true`

If `false`, the LEF MUSTJOINALLPORTS property on a LEF PIN automatically creates the MUSTJOIN pins for each PORT. If `true`, the MUSTJOIN pins are not created, but the router must be connected to every port with a single wire or single-via that physically overlaps all the ports.

4

Bus Plan Commands

- createBusGuide
- deleteBusGuide
- deselectBusGuide
- resetBusGuideMultiColors
- selectBusGuide
- selectBusGuideSegment
- setBusGuideMultiColors
- update_bus_guide

createBusGuide

```
createBusGuide
[-help]
[-type {hard | soft}]
-netGroup netGrpName
-layer {id | id1:id2}
{[{-centerLine {x1 y1 x2 y2} -width value} [-beginExt value] [-endExt value]] | -rect
{x1 y1 x2 y2}}
```

Creates bus guides associated with net groups, to guide routing for all the nets of the specified net group. You can create horizontal, vertical, and 45-degree bus guide segments. 45-degree bus guides are required for flip chip routing.

Use this command after defining a net group that will be associated with the new bus guide segment.

After a bus guide is created, you can modify its layer or width later by using the `update_bus_guide` command.

Parameters

`-help`	Prints a brief description that includes type and default information for each `createBusGuide` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createBusGuide`.
`-beginExt` *value*	Specifies the value, in microns, by which the bus guide segment is to be extended in the beginning.
`-centerLine` *x1 y1 x2 y2*	
	Specifies the coordinates of the center line of the bus guide segment. The direction of the guide segment is derived from the `x1 y1 x2 y2` coordinate values. **Note:** Non-orthogonal bus guide segments are not supported.
`-endExt` *value*	Specifies the value, in microns, by which the bus guide segment is to be extended in the end.
`-layer {`*id* `|` *id1*`:`*id2*`}`	Specifies the routing layer constraint honored by the router. ⓘ Routing done on non-preferred routing layers or on layers which are not part of the specified layer constraint can have high cost implications
`-netGroup` *netGrpName*	Specifies the name of the net group that will be associated with the new bus guide segment that you are creating.
`-rect {`*x1 y1 x2 y2*`}`	Specifies the lower-left and upper-right coordinates of the rectangle formed by the bus guide segment.

`-type {hard | soft}`	Specifies the constraint type of the bus guide: • `hard` - After running Early Global Route (eGR), NanoRoute (NR), or NanoRoute High Frequency Router (NRHF), the route obeys the path of the bus guide. • `soft` - After running eGR, NR, or NRHF, the bus guide only guides the route path. The tool can route the net out of the bus guide. *Default*: `soft` (If you don't specify the `-type` parameter to define the constraint type, the value of constraint type is taken as `soft`.)
`-width` *value*	Specifies the width, in microns, of the bus guide segment that you are creating.

Examples

- The following command creates a horizontal bus guide segment whose width is `120` microns, and layer constraint is from METAL4 to METAL8:
  ```
  createBusGuide -netGroup netGroup1 -centerLine 4421.8 10749.36 4960.8 10749.36 -width 120 -layer METAL4:METAL8
  ```
- The following command creates a bus guide segment whose lower-left coordinate is at pt {`464 1240`} and upper-right coordinate is at pt {`528 1260`} for the net group `test` and with a layer constraint of Metal1 to Metal4:
  ```
  createBusGuide -netGroup test -layer {1:4} -rect {464 1240 528 1260}
  ```
- The following command creates a 45-degree bus guide segment:
  ```
  createBusGuide -netGroup test3Group -centerLine 400 500 450 550 -width 20 -layer {METAL7:METAL8}
  ```

Related Information

  - *Bus Guide*

deleteBusGuide

```
deleteBusGuide
[-help]
[-area x1 y1 x2 y2]
[-netGroup {netGroup | {list_of_net_groups}}]
[-layer {id | id1:id2}]
[-direction {H | V}]
[-all]
```

Deletes a bus guide.

If you do not specify any option, by default, the command delete all the bus guide segments.

Use this command after creating a bus guide segment.

Parameters

`-all`	Deletes all bus guide segments in the design.
`-area` *`x1y1x2y2`*	Specifies the coordinates of the area from which the bus guide segments are deleted.
`-direction {H | V}`	Specifies the direction of the bus guide segment to delete. This can be `H` (horizontal) or `V` (vertical).
`-help`	Outputs a brief description that includes type and default information for each `deleteBusGuide` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteBusGuide`.
`-layer {`*`id`* `|` *`id1`*`:`*`id2`*`}`	Specifies the layer or layer range from which bus guide segments are deleted. The command deletes bus guide segments with the exact specified layer information and not a subset of it. For example, for a bus guide segment with layer constraint `2:5` if you specify `-layer 5`, the segment is not deleted. To delete this guide segment you need to specify `-layer 2:5` completely.
`-netGroup {`*`netGroup`*`|` `{`*`list_of_net_groups`*`}}`	Specifies the name of the net group or list of net groups from which the bus guide segments are deleted. You can also use wildcard (* or ?) for specifying the net group name.

Example

The following command deletes all the bus guide segments associated with the net group `abcBus` that has layer constraint from `Metal 3` to `Metal 7`:

```
deleteBusGuide -netGroup abcBus -layer 3:7
```

deselectBusGuide

```
deselectBusGuide
[-help]
[-area x1 y1 x2 y2]
[-netGroup {netGroup | {list_of_net_groups}}]
[-layer {id | id1:id2}]
[-direction {H | V}]
[-all]
```

Deselects a bus guide segment.

If you do not specify any option, by default, the command deselects all the bus guide segments.

Use this command after selecting a bus guide segment.

Parameters

`-all`	Deselects all the bus guide segment in the design.
`-area` *`x1y1x2y2`*	Specifies the coordinates of the area from which the bus guide segments are deselected.
`-direction {H | V}`	Specifies the direction of the bus guide segment to deselect. This can be `H` (horizontal) or `V` (vertical).
`-help`	Outputs a brief description that includes type and default information for each `deselectBusGuide` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deselectBusGuide`.
`-layer {`*`id`* `|` *`id1`*`:`*`id2`*`}`	Specifies the layer or layer range from which bus guide segments are deselected. The command deselects bus guide segments with the exact specified layer information and not a subset of it. For example, for a bus guide segment with layer constraint `2:5` if you specify `-layer 5`, the segment is not deselected. To deselect this guide segment you need to specify `-layer 2:5` completely.
`-netGroup {`*`netGroup`*`|` `{`*`list_of_net_groups`*`}}`	Specifies the name of the net group or list of net groups from which the bus guide segments are deselected. You can also use wildcard (* or ?) for specifying the net group name.

Example

The following command deselects all the bus guide segments associated with the net group `abcBus` that has layer constraint from metal `3` to metal `7`:

```
deselectBusGuide -netGroup abcBus -layer 3:7
```

resetBusGuideMultiColors

`resetBusGuideMultiColors`

Clears the highlighted bus guide colors.

Use this command after `setBusGuideMultiColors` has been used to color the bus guide(s).

Parameters

None

Related Information

- `setBusGuideMultiColors`
- Bus Planning chapter in the *User Guide*
  - *Highlighting and Dehighlighting the Bus Guide*

  - *Bus Guide*

selectBusGuide

```
selectBusGuide
[-help]
[-all]
[-area {x1 y1 x2 y2} ]
[-direction {H | V}]
[-layer { id | id1 : id2 }]
[-netGroup { netGroup | { list_of_net_groups }}]
```

Selects a bus guide segment.

Note: If you do not specify any option, by default, the command selects all the bus guide segments.

Use this command after creating a bus guide segment.

Parameters

`-all`	Selects all the bus guide segments in the design.
`-area {x1 y1 x2 y2}`	Specifies the coordinates of the area from which the bus guide segments are selected.
`-direction {H | V}`	Specifies the direction of the bus guide segment to select. This can be `H` (horizontal) or `V` (vertical).
`-help`	Outputs a brief description that includes type and default information for each `selectBusGuide` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man selectBusGuide`.
`-layer {id | id1: id2}`	Specifies the metal layer or layer range from which bus guide segments are selected. The command selects bus guide segments with the exact specified layer information and not a subset of it. For example, for a bus guide segment with layer constraint `2:5` if you specify `-layer 5`, the segment is not selected by the command. To select this guide segment you need to specify `-layer 2:5` completely.
`-netGroup {netGroup | {list_of_net_groups}}`	
	Specifies the name of the net group or list of net groups from which the bus guide segments are selected. You can also use wildcard (* or ?) for specifying the net group name.

Example

The following command selects all the horizontal (`H`) bus guide segments associated with the net group `group1`:

```
selectBusGuide -netGroup group1 -direction H
```

selectBusGuideSegment

```
selectBusGuideSegment
[-help]
[-box x1 y1 x2 y2]
[-layer {id | id1:id2}]
[-netGroup {netGroup}]
```

Selects a bus guide segment with its specified bounding box. This command is mainly used for recording the bus guide segment selection operation in the software's command file.

Use this command after creating a bus guide segment.

Parameters

`-box x1y1x2y2`	Specifies the coordinates of the bus guide box to select.
`-help`	Outputs a brief description that includes type and default information for each `selectBusGuideSegment` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man selectBusGuideSegment`.
`-layer {id | id1:id2}`	Specifies layer or layer range from which the bus guide segment is to be selected.
`-netGroup {netGroup| {list_of_net_groups}}`	Specifies the name of the net group or list of net groups from which the bus guide segment is to be selected.

Example

The following command selects the bus guide segment that has bounding box coordinates `x1` = `15150.7`, `y1` = `7061.0`, `x2` = `15450.7`, `y2` = `11230.0`, layer constraint on metal `3`, associated with the net group `busGroup`.

```
selectBusGuideSegment -netGroup busGroup -box 15150.7 7061.0 15450.7 11230.0 -layer 3
```

update_bus_guide

```
update_bus_guide
[-help]
[-avoidObstacles]
[-layer_horizontal {id | id1:id2}]
[-layer_vertical {id | id1:id2}]
[-no_snap]
[-resize_direction {low high}]
[-type {hard | soft}]
[-width value | -net_group name | {{-rule rulename | {-wire_width value -
wire_spacing value}} [-with_shield]}]
```

Updates the selected bus guide as specified. The bus guide can expand automatically with pre-route or routing blockage.

Use the `update_bus_guide` command when you need to modify the layer or width information of an existing bus guide. Before using the `update_bus_guide` command, select the bus guide with the `selectBusGuide` command.

Parameters

`-help`	Prints a brief description that includes type and default information for each `update_bus_guide` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man update_bus_guide`
`-avoidObstacles`	Specifies whether to avoid pre-routes and blockages (detour). If this option is not specified, the bus guide is expanded with the pre-route and routing blockage.
`-layer_horizontal {id | id1:id2}`	Specifies the horizontal layer *id* or a layer range. Use this parameter to change the horizontal layer of the selected bus guide.
`-layer_vertical {id | id1:id2}`	Specifies the vertical layer *id* or a layer range. Use this parameter to change the vertical layer of the selected bus guide.
`-net_group name`	Specifies the net group name. The net group you specify must be an existing net group.

`-no_snap`	Specifies whether or not to snap the bus guide.
`-resize_direction {low high}`	Specifies the resize direction as follows: • `low`: Expands the selected bus guide from the top or right edge. • `high`: Expands the selected bus guide from the bottom or left edge. If this option is not specified, the bus guide is expanded from the center line.
`-rule` *`rulename`*	Specifies the rule name or default. Use this parameter to change the selected bus guide width as per the wire width or wire spacing defined in the specified LEF rule. If *`rulename`* is not specified, default LEF rule is used. **Note**: This parameter cannot be used with the `-width`, `-wire_width`, or `wire_spacing` parameters.
`-type {hard | soft}`	Specifies the new constraint type of the bus guide: • `hard` - After running Early Global Route (eGR), NanoRoute (NR), or NanoRoute High Frequency Router (NRHF), the route obeys the path of the bus guide. • `soft` - After running eGR, NR, or NRHF, the bus guide only guides the route path. The tool can route the net out of the bus guide.
`-width` *`value`*	Specifies bus guide width. Use this parameter to change the selected bus guide width to the specified value. **Note**: This parameter cannot be used with the `-rule`, `-wire_width`, or `wire_spacing` parameters.
`-wire_spacing` *`value`*	Specifies wire spacing. Use this parameter to change the selected bus guide width as per the specified wire spacing value. **Note**: This parameter cannot be used with either the `-rule` parameter or the `-width` parameter.
`-wire_width` *`value`*	Specifies wire width. Use this parameter to change the selected bus guide width as per the specified wire width value. **Note**: This parameter cannot be used with either the `-rule` parameter or the `-width` parameter.

`-with_shield`	Adds shield wire base on the shield net property defined by the following `setEditMode` options: `-outer_shield_spacing`, `-outer_shield_width`, and `-shield`. When specified with: • `-wire_width` and `-wire_spacing`, the tool considers only the outer shielding nets. • `-rule`, the tool considers the shielding nets between wires.

Example

- The following command updates the width of the selected bus guide as per the NDR *doublewidth* defined in LEF. It also changes the horizontal layer of the selected bus guide to 3 and considers the shielding nets between wires.
```
update_bus_guide -rule doublewidth -layer_horizontal 3 -with_shield
```

add_clock_tree_source_group_roots

```
add_clock_tree_source_group_roots
[-help]
-cell driverCell
[-locations {{x1 y1} {x2 y2}...}]
-name sourceGroupName
-pin rootPin
[-grid {columns rows} [[-adjust_grid_for_aspect_ratio]
[-grid_rect {lx ly ux uy}]
[-grid_search_area {width height}]
[-grid_exclusion_rects {{lx1 ly1 ux1 uy1} {lx2 ly2 ux2 uy2}...}]]]
```

This command updates the design and clock tree specification to create a multiple-tree "source group" below the specified driving root pin. A source group is a set of multiple, logically equivalent, clock trees that drive a collection of clock tree sinks. The

actual allocation of sinks to specific source group roots is chosen during clock tree synthesis.

This command performs the following tasks:

- Inserts the instances that will become the clock tree roots into the netlist. Their input pins will be driven by the root pin and the fanout originally driven by the root pin will be rewired to the output of a single root instance.
- Defines clock trees at the outputs of each of the newly inserted root instances.
- Defines a clock source group to combine the clock trees.

You can insert a grid of tap buffers and also omit a tap buffer at grid points that are blocked. For this, you can specify grid coordinates, a two-value pair `{x y}`, that place the source group driver at that location.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `add_clock_tree_source_group_roots` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_clock_tree_source_group_roots`.
`-adjust_grid_for_aspect_ratio`	
When specified, exchanges rows and columns to match the aspect ratio.	
`-cell` *`driverCell`*	Specifies the buffer cell to use for new source group # roots (`libCell/ptnCell`). This is a required parameter.
`-grid {columns rows}`	
	Specifies a grid of target locations. By default, the command attempts to create a full grid consisting of columns and rows. However, if a particular grid target point falls within an exclusion rectangle, specified using the `-grid_exclusion_rects` parameter, then that grid point will be skipped. If the `-adjust_grid_for_aspect_ratio` parameter is specified, the columns and rows will be swapped if doing so better matches the aspect ratio of the grid rectangle area. **Note**: The `-grid` and `-locations` parameters can be used together. For example, you can specify a grid, and then use `-locations` to add a few additional taps in specific floor-plan locations.
`-grid_exclusion_rects {{lx1 ly1 ux1 uy1} {lx2 ly2 ux2 uy2}...}`	
	Provides the coordinates of rectangular areas that should not contain source group roots. Any grids that fall within the exclusion rectangle will be ignored.
`-grid_rect {lx ly ux uy}`	

	Specifies the area that the grid should cover. This parameter provides the overall rectangle intended to be driven by the taps requested by the `-grid` parameter. **Note**: This parameter does not specify the bounding box of the grid taps. Basically the overall `-grid_rect` rectangle is cut up into `m x n` smaller rectangles, and a tap is targeted at the center of each smaller rectangle. to understand more clearly, consider the below example. If you have `-grid {2 2}` and `-grid_rect {0 0 100 100}`, the corresponding target locations will be `{{25 25} {25 75} {75 25} {75 75}}`. This is different than if the `-grid_rect` were the bounding box of tap locations, in which case it would be `{{0 0} {0 100} {100 0} {100 100}}`).
`-grid_search_area {width height}`	
	Specifies the size of the search area around each grid point.
`-locations {{x1 y1} {x2 y2}...}`	
	Specifies a list of (`x,y`) locations for the new roots that are to be created. The specified roots are inserted at the nearest legal location. **Note**: This parameter takes a list of points, not rectangles. A specified point will be taken as a tap target location, and the software will search for the nearest legal location. If the `-grid_search_area {width height}` parameter is specified, the search will be limited to the points specified using the `-grid` parameter and not points specified using the `-locations` parameter. If it is not specified, the software will search as far as needed to find a legal location for a tap. If a legal location cannot be found, either within the specified search area, or anywhere in the floorplan, the tap will be added at the target location and not legalized. If all taps can be inserted at legal locations, they will be set to locked for CTS placement status. If one or more taps cannot be legalized, the command will print a warning and all taps will be left in simple placed status. **Note**: The behavior when a tap cannot be legalized, and for whether taps are locked applies to all taps created by this command - from the `-grid` and/or `-locations` parameters.
`-name` *prefix*	Specifies the name of the source group to be created for the roots. The name should be unique. The multi-tap roots will be named using this string as a prefix. For example, `sourceGroupName_0`, `sourceGroupName_1`..`sourceGroupName_n`. **Note**: • The skew group name will be `<`*prefix*`>_skew_group`. • The clock tree name for a tap will be `<`*prefix*`>_<index>`, and `<`*prefix*`>_<index>_inst` for the corresponding cell instance. This is a required parameter.
`-pin` *rootPin*	Specifies the name of the root pin that will drive the multi-tap root inputs. The pin must be an output pin and must drive a net. The entire clock structure, including clock gates, flops, and so on that are to be driven by the multi-tap roots should originally be connected below this pin. If there are multiple drivers on the root net, any one of their output pins may be specified as the `-pin` parameter. This is a required parameter.

Related Commands

- assign_clock_tree_source_groups
- create_ccopt_clock_tree_source_group
- delete_ccopt_clock_tree_source_group
- get_ccopt_clock_tree_source_groups

assign_clock_tree_source_groups

```
assign_clock_tree_source_groups
[-help]
[-no_merge]
```

When used on designs with clock tree source group definitions, this command assigns clock sinks to the source group roots - multi-tap assignment - and then performs the cloning and rewiring necessary to distribute the sinks among the source group roots.

Note that the source group assignment process normally happens automatically during the early stages of clock tree synthesis. However, on large designs, the full clock tree synthesis step can take some time. The purpose of this command is to provide an easier way to get early feedback about the multi-tap assignment process, visualize the result, adjust source group definitions, and so on.

By default, the command will do initial clock gate merging and then clone as necessary to implement the assignment. However, the merging step can be disabled by specifying the `-no_merge` option. If no source groups are defined, the command will do nothing.

After running the command, you can review the log file messages, or check the result in the database either by using the Tcl commands, clock tree debugger, and so on.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `assign_clock_tree_source_groups` parameter. For a detailed description of the command and all of its parameters, use the man command: `man assign_clock_tree_source_groups`.
`-no_merge`	Specifies that clock gates should not be merged.

Related Commands

- `add_clock_tree_source_group_roots`
- `create_ccopt_clock_tree_source_group`
- `delete_ccopt_clock_tree_source_group`
- `get_ccopt_clock_tree_source_groups`

calculate_ccopt_cannot_clone_reason

```
calculate_ccopt_cannot_clone_reason
[-help]
-inst instName
```

Returns a Tcl list of reasons why the specified instance cannot be cloned in CTS. An empty list indicates the given instance can be cloned. This command is similar to the CCOpt property, `cannot_clone_reason` but it can be used before running `ccopt_design`.

It differs from the property, `cannot_clone_reason` in that it always calculates the reason as compared to just retrieving a saved property value from the last time that cloning happened.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `calculate_ccopt_cannot_clone_reason` parameter. For a detailed description of the command and all of its parameters, use the man command: `man calculate_ccopt_cannot_clone_reason`.
`-inst` *instName*	Specifies the name of the instance for which you want to know the reason for being uncloneable.

Related Information

- The `cannot_clone_reason` property.
  This property provides a list of reasons to explain why the cell could not be cloned during clustering. For more information on above property, see the CCOpt Properties chapter in the *Innovus User Guide* or run the following command:

  ```
  get_ccopt_property -help cannot_clone_reason
  ```

- `ccopt_design`
- `clock_opt_design`

ccopt_add_exclusion_drivers

```
ccopt_add_exclusion_drivers
[-help]
[-lib_cell list_library_cells]
```

Removes the excluded sinks from the clock trees by adding exclusion drivers above these sinks. Use this command after running the `create_ccopt_clock_tree_spec` command. Alternatively, you can use the `add_exclusion_drivers` property to remove the exclude sinks from the clock tree. It is recommended that you use one of the two, either the command or the property, to exclude sinks from the clock trees.

For details of this property, see the "Related Properties" section below.

The names of the newly added drivers start with '`CTS_cse`', so that they can be easily identified. This functionality is useful because it allows you to fix hold violations on clock nets. GigaOpt does not fix hold violations on clock nets. For example, if a pin, D, of a flop is a clock sink then the net attached to the D pin is a clock net. Any hold violations will not be fixed by GigaOpt. However, by adding an exclusion buffer above the D pin, the net between the buffer's output pin and the D pin of the flop becomes a non-clock net and any hold violations will be fixed by GigaOpt. Therefore, this new functionality allows previously unfixable hold violations to be fixed.

You can use the following command to view the exclusion drivers that have been added by CCOpt:

```
get_ccopt_clock_tree_sinks *CTS_cse*
```

Parameters

`-help`	Outputs a brief description that includes type and default information for each `ccopt_add_exclusion_drivers` parameter. For a detailed description of the command and all of its parameters, use the man command: `man ccopt_add_exclusion_drivers`.
`-lib_cell`	Specifies a particular buffer or inverter to use as an exclusion driver. If this parameter is not specified or if the property, `add_exclusion_drivers`, is used to enable this functionality, then CCOpt will choose small area drivers from the CTS cell lists to use as exclusion drivers. CCOpt will either add pairs of inverters, or single buffers as exclusion drivers. While choosing the cell to use, CCOpt will choose either inverters or buffers depending on the value specified using the `use_inverters` property. This property specifies whether clock tree synthesis should use inverters or buffers when balancing the clock trees. For more information about the `use_inverters` property, use the following command: `get_ccopt_property -help use_inverters`

Related Properties

- `add_exclusion_drivers`
  This is a user-settable property. Setting this property to `true` before running `ccopt_design` or `ccopt_design -cts` will cause CCOpt to add extra drivers above exclude pins to remove them from the clock tree.

  Normally an exclusion buffer or a pair of inverters are added above an exclude sink to remove them from the clock tree. A new clock sink will be created on the input to the newly added driver. If there is a suitable pre-existing driver above the exclude pin, then no extra driver will be added – the new clock sink will be created on the input to the pre-existing driver.
- `effective_sink_type`
  This is a read-only property. It indicates how CCOpt will treat a given pin, taking into account any `implicit_sink_type` and `sink_type` settings.

- `implicit_sink_type`
  This is a read-only property. It Indicates the type of sink that CCOpt classified this pin as. The possible values are `exclude`, `ignore`, `stop`, and `empty string ""`. Instances of cell pins that are data pins, scan input pins, or scan enable pins will have `implicit_sink_type=exclude`. This means that unless there is an explicit `sink_type` set for that pin, either `ignore` or `stop`, they will be removed from the clock tree. This property takes into account the settings done using the sink_tpe property. Setting a non-default value for the `sink_type` property will override the `implicit_sink_type` property.
- `sink_type`
  This is a user-settable property. It specifies the type of sink that the pin represents. Valid values are `auto`, `through`, `stop`, `ignore`, `min`, and `exclude`. To exclude a clock sink that is not already `implicit_exclude`, you can set this property to `exclude`. This will change the `effective_sink_type` property to `exclude`, and the sink will be removed from the clock tree.

  For more information about the above properties, use the following command:
  `get_ccopt_property -help property_name`

[-timing_debug_report]
```

Performs clock concurrent optimization (CCOpt) on the current loaded design in Innovus. CCOpt optimizes both the clock tree and the datapath to meet global timing constraints.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `ccopt_design` parameter. For a detailed description of the command and all of its parameters, use the man command: `man ccopt_design`.
`-check_prerequisites`	Checks that all the prerequisites for running clock tree synthesis are fulfilled without actually doing CTS. For example, it checks that the design is loaded, and the options set by that the user are correct.
`-ckSpec`	Runs the design using the legacy FE-CTS specification file. This mode is a compatibility layer to enable the use of CCOpt technology with existing FE-CTS specification flows. It enables a translation step that transforms constructs in the FE-CTS specification file into a CCOpt clock tree specification tcl script. **Note**: This parameter is used with the `-cts` parameter to specify that CTS part of CCOpt will be performed using the legacy FE-CTS specification file.
`-cts`	Turns off clock concurrent optimization, and performs only clock tree synthesis (CTS) using the CCOpt engine. It does not perform any datapath optimization or useful skew. This parameter can be used with or without the `-ckSpec` parameter. When used with the `-ckSpec` parameter, it specifies that the CTS part of CCOpt will be performed using the legacy FE-CTS specification file.
`-expandedViews`	This parameter is not interpreted in CCOpt but passed directly to `optDesign`. The parameter is same as `optDesign -expandedViews` parameter, which is specified to generate detailed view-specific timing reports at the end of the `optDesign` command run.
`-num_paths` *number_of_paths*	Specifies the number of paths generated in the timing reports. By default, all timing paths are reported.
`-outDir` *dirname*	This parameter specifies the directory where the software writes timing reports that are generated after timing optimization. The default directory is `./timingReports`
`-prefix` *fileNamePrefix*	Specifies a prefix for `optDesign` report file names. *Default*: `DesignName_DesignStage` , where `DesignStage` is preCTS, postCTS, or postRoute
`-timing_debug_report`	When specified, generates a machine-readable timing debug report after completing CTS. This report is used for debugging timing results using the timing debug feature in Innovus. The number of paths to be reported can be specified using the `-num_paths` parameter.

Example

- The following command runs a complete CCOpt optimization:
  ```
  ccopt_design
  ```

Related Information

- `clock_opt_design`
- `create_ccopt_clock_tree_spec`
- `optDesign`
- The following topic in the *Innovus User Guide*
  - Flow and Quick Start for CTS

ccopt_pro

```
ccopt_pro
[-help]
[-enable_average_id_reduction {true | false}]
[-enable_downsizing_pass {true | false}]
[-enable_drv_fixing {true | false}]
[-enable_drv_fixing_by_rebuffering {true | false}]
[-enable_refine_place {true | false}]
[-enable_routing_eco {true | false}]
[-enable_skew_fixing {true | false}]
[-enable_skew_fixing_by_rebuffering {true | false}]
```

Repairs clock tree design rule violations (DRVs) and skews that have occurred in the clock tree across a routing step. DRVs and skews can be fixed either by sizing existing clock instances or by adding buffers. Use this command to enable or disable average insertion delay reduction, global cell downsizing pass, refine placement of design, ECO routing, legalizer sharing, and the timing update step.

This command can be run at the following stages:

- After `ccopt_design` – when only the clock is routed
- After `routeDesign` , but before `optDesign -postRoute` – when both clock and datapath are routed.

By default a post `ccopt_design` call to this command will fix DRVs and skew violations by resizing instances. It will also fix persistent DRVs by adding buffers. However, when called post `routeDesign`, this command is less disruptive by default and will only

perform resizing to fix DRVs. The `ccopt_pro` log will report a list of "active optimizations" for clarification of what steps will be executed.

By default, the command will modify the clock to reduce violations and then call `refinePlace` and `ecoRoute` to patch up the modified routes. Both `refinePlace` and `ecoRoute` parts may be disabled to reduce runtime for user experimentation. But they will need to be called eventually, either with a final call to `ccopt_pro` or manually. Without them, timing measurements will be inaccurate.

Note:

- This command is integrated within the `ccopt_design` command and is run after clock routing. It can be identified in the `ccopt_design` log with a search for "PostConditioning....".
- This command is integrated within the `optDesign -postRoute` command. It can be identified in the `optDesign` log with a search for "PRO...".
- If this command is called after running `ccopt_design` (when only the clock is routed), it will also call `earlyGlobalRoute` on the datapath nets.
- The `ccopt_pro` command and the clock DRV fixing performed by running `optDesign -postRoute` do not work when signoff effort-level for extraction is specified using `setExtractRCMode -effortLevel signoff`. The signoff effort-level for extraction should be used only for ECO flows, after postRoute optimization.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `ccopt_pro` parameter. For a detailed description of the command and all of its parameters, use the man command: `man ccopt_pro`.
`-enable_average_id_reduction {true | false}`	Enables or disables average insertion delay reduction.
`-enable_downsizing_pass {true | false}`	Enables or disables a global cell downsizing pass.
`-enable_drv_fixing {true | false}`	Enables or disables DRV fixing.
`-enable_drv_fixing_by_rebuffering {true | false}`	Enables or disables DRV fixing by adding buffers.
`-enable_refine_place {true | false}`	Enables or disables refine placement of design. Disabling this may result in instance overlaps.
`-enable_routing_eco {true | false}`	Enables or disables the ECO routing step, which corrects routing for new instance locations. Disabling this will leave inaccurate routing in place and lead to timing inaccuracy.
`-enable_skew_fixing {true | false}`	Enables or disables fixing of clock tree skew. **Note the following**: • When `-enable_skew_fixing` is set to `false` then whether the `-enable_skew_fixing_by_rebuffering` parameter is specified as `true` or `false`, there is no skew fixing during `ccopt_pro`. • When `-enable_skew_fixing` is set to `true`, while `-enable_skew_fixing_by_rebuffering` parameter is set to `false`, the software resizes cells to fix skew. • When `-enable_skew_fixing` is set to `true`, while `-enable_skew_fixing_by_rebuffering` parameter is set to `true`, the software not only resizes cells but also does rebuffering to fix skew.
`-enable_skew_fixing_by_rebuffering {true | false}`	Enables or disables fixing of clock tree skew by adding buffers. This will only help with lengthening short paths.

check_ccopt_clock_tree_convergence

```
check_ccopt_clock_tree_convergence
[-help]
[-warnthreshold thresholdValue]
```

This command is used to trigger a warning message for sinks that have more than the specified number of convergence paths from the clock sources to the sink. This check is performed at the end of clock tree specification, for complex convergence above sinks that might cause large runtimes in CCOpt as it attempts to balance these trees.

When this command is specified, any sinks that are found to have more than the specified *thresholdvalue* of paths from the clock sources to the sink are reported in a warning message from the software. For example:

```
WARN: (IMPCCOPT-4338): There are 17 clock paths leading to primaryout. This may cause long CCOpt runtimes. Type
'man IMPCCOPT-4338' for more detail.
```

The following detailed information is provided when you type `man IMPCCOPT-4338`:

```
The design contains a lot of converging clock paths leading to some sinks. This may cause long CCOpt runtimes.
The sinks with the most paths leading to them can be found with report_ccopt_clock_tree_convergence. See CCOpt
Clock Tree Specification under Clock Concurrent Optimization in the User Guide for more information.
```

Note: The warning is issued if the number of clock paths to any sink is greater than the threshold value of paths specified by the command `check_ccopt_clock_tree_convergence`.

To view a summary of the convergence above clock sinks and to identify the names of the sinks with the highest number of clock network paths, run the `report_ccopt_clock_tree_convergence`command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `check_ccopt_clock_tree_convergence` parameter. For a detailed description of the command and all of its parameters, use the man command: `man check_ccopt_clock_tree_convergence`.
`-warnthreshold` *thresholdValue*	Triggers a warning message for sinks with more than the specified number of paths. *Default*: `100`

clock_opt_design

```
clock_opt_design
[-help]
[-check_cts_config]
[-cts]
[-expandedViews]
[-num_paths number_of_paths]
[-out_dir dirname]
[-prefix fileNamePrefix]
[-timing_debug_report]
```

The `clock_opt_design` command is used in place of `ccopt_design` when the input DB is place_opt_design V2 (PODV2 or pod-turbo). It performs clock concurrent optimization (CCOpt) on the current loaded design in Innovus. CCOpt optimizes both the clock tree and the datapath to meet global timing constraints. The only difference between this flow and the `ccopt_design` flow is that `clock_opt_design` has legalization at the beginning to remove overlapping caused by PODV2 optimization.

In this flow, the commands, `place_opt_design` and `clock_opt_design` are used in combination. This means that the `clock_opt_design` command can only be used with the `place_opt_design V2 (PODV2)`, which is the `place_opt_design` command that is run after enabling the PODV2 flow.

For details of the flow, see The clock_opt_design Flow.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `clock_opt_design` parameter. For a detailed description of the command and all of its parameters, use the man command: `man clock_opt_design`.
`-check_cts_config`	Checks that all the prerequisites for running clock tree synthesis are fulfilled without actually doing CTS. For example, it checks that the design is loaded, and the options set by that the user are correct. There are no changes made to the design
`-cts`	Turns off clock concurrent optimization, and performs only clock tree synthesis (CTS) using the CCOpt engine. It does not perform any datapath optimization or useful skew.
`-expandedViews`	This parameter is not interpreted in CCOpt but passed directly to `optDesign`. The parameter is same as `optDesign -expandedViews` parameter, which is specified to generate detailed view-specific timing reports at the end of the `optDesign` command run.
`-num_paths` *`number_of_paths`*	Specifies the number of paths generated in the timing reports. By default, all timing paths are reported.
`-out_dir` *`dirname`*	This parameter specifies the directory where the software writes timing reports that are generated after timing optimization. The default directory is `./timingReports`
`-prefix` *`fileNamePrefix`*	Specifies a prefix for `optDesign` report file names. *Default*: `DesignName_DesignStage` , where `DesignStage` is preCTS, postCTS, or postRoute
`-timing_debug_report`	When specified, generates a machine-readable timing debug report after completing CTS. This report is used for debugging timing results using the timing debug feature in Innovus. The number of paths to be reported can be specified using the `-num_paths` parameter.

Examples

- The following command runs a complete CCOpt optimization for the podV2 flow:
  ```
  clock_opt_design
  ```

close_ctd_win

```
close_ctd_win
[-help]
[-all | -id WindowIDName]
```

Closes open CTD windows. When no parameter is specified, the command closes the current active CTD window.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `close_ctd_win` parameter. For a detailed description of the command and all of its parameters, use the man command: `man close_ctd_win`.
`-all`	Closes all open CTD windows.
`-id` *`WindowIDName`*	Closes the CTD window with the specified window ID. **Note**: The parameters, `-all` and `-id` are mutually exclusive.

Examples

- The following command closes all CTD windows in the current session:

  ```
  close_ctd_win -all
  ```

- The following command closes the CTD window with the ID, `user_id2`:

  ```
  close_ctd_win -id user_id2
  ```

commit_ccopt_clock_tree_route_attributes

```
commit_ccopt_clock_tree_route_attributes
[-help]
[-verbose]
```

The command traces the clock tree as defined by the CCOpt spec and sets net attributes to allow early-global-route to more predictably model clock nets. It sets `isClock` and `isCTSClock` on clock tree nets in the database. It applies routing preferences such as: `top_preferred_layer`, `bottom_preferred_layer`, `non_default_rule`, and `shield_net` based on the "`route_type`" CCOpt properties.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `commit_ccopt_clock_tree_route_attributes` parameter. For a detailed description of the command and all of its parameters, use the man command: `man commit_ccopt_clock_tree_route_attributes`.
`-verbose`	Prints the layer constraint summary for CCOpt nets after attribute application.

Related Information

For detailed information, see the CCOpt Properties chapter in the *Innovus User Guide*.

You can also view property help by running the following command:

```
get_ccopt_property -help property name
```

connect_clock_tree_mesh_drivers

```
connect_clock_tree_mesh_drivers
[-help]
[-driver_pins pin_names]
[-driver_source_group source_group_name]
```

Uses the specified set of drivers and merges the nets at their outputs to form a single multi-driven net. To run this command successfully, one of the two options, `-driver_pins` or `-driver_source_group` must be specified.

It is possible that some or all of the driver pin nets are already multi-drive. You might be repeating the same command, or you could be merging additional drivers into an already multi-drive net. Running the command twice does nothing the second time. If the net of any driver pin is *already* multi-drive, the pin list will be interpreted to include all drivers of that net.

The command returns the resulting merged net through a Tcl return value.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `connect_clock_tree_mesh_drivers` parameter. For a detailed description of the command and all of its parameters, use the man command: `man connect_clock_tree_mesh_drivers`.
`-driver_pins` *`pin_names`*	Specifies a list of driver output pins whose nets will be merged to form a multi-drive mesh net. **Note**: This parameter is optional if the `-driver_source_group` parameter is specified.
`-driver_source_group` *`source_group_name`*	Specifies the source group for the list of driver output pins. Only the root pins of the specified source group will be included in the list of driver output pins. **Note**: This parameter is optional if the `-driver_pins` parameter is specified.

Related Command

- `add_clock_tree_source_group_roots`

convert_lib_clock_tree_latencies

```
convert_lib_clock_tree_latencies
[-help]
[-latency_file_prefix prefix_name]
[-pins pin_list]
[-views view_list]
[-override_existing_latencies | -sum_existing_latencies]
[-sum_existing_latencies | -override_existing_latencies_pins pin_list]
[-override_existing_latencies | -sum_existing_latencies_pins pin_list]
[-sum_existing_latencies | -sum_existing_latencies_pins pin_list]
[-override_existing_latencies | -override_existing_latencies_pins pin_list]
```

Converts the Liberty `max_clock_tree_path` and `min_clock_tree_path` (MCTP) data to per-pin clock latency adjustments.

Note:

- Run the command before running the `create_ccopt_clock_tree_spec` command so that the the output of `convert_lib_clock_tree_latencies` command impacts the clock tree specification that is created.
- Before running this command, ensure that the analysis type is set as `onChipVariation` in the following manner:
  `setAnalysisMode -analysisType onChipVariation`

By default, the conversion will consider all instance pins with MCTP data in all analysis views. Pins which have any existing network latency, differing from the corresponding clock network latency will be skipped completely for all clocks and for all views – this avoids the conversion process from interfering with any SDC-specified pin latencies. Alternatively, existing latency offsets can be summed or overridden for all or names pins using the appropriately named override and sum option. Additionally, the `-pins` option can be used to consider only a specified list of pins instead of all pins with MCTP data.

By default, the conversion will internally apply the resulting `set_clock_latency` commands to the in memory timing constraints. Alternatively the `-latency_file_prefix` parameter can be specified to have one file per analysis view written containing the `set_clock_latency` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `convert_lib_clock_tree_latencies` parameter. For a detailed description of the command and all of its parameters, use the man command: `man convert_lib_clock_tree_latencies`.
`-latency_file_prefix` *prefix_name*	
	When specified, the software, instead of applying changes, writes the commands to one latency file per analysis view. Any pre-existing files are overwritten. For example, *<prefix><analysis_view_name>.sdc* **Note**: The prefix may contain directory name components. New directories should be created, as required.
`-override_existing_latencies`	

	When specified, includes all pins with existing latency offsets and overwrites the existing latency offsets. **Note**: • The `-override_existing_latencies` and `-sum_existing_latencies` parameters are mutually exclusive. • The `-override_existing_latencies` and `-sum_existing_latencies_pins` parameters are mutually exclusive. • The `-override_existing_latencies` and `-override_existing_latencies_pins` parameters are mutually exclusive.
`-override_existing_latencies_pins` *pin_list*	
	Includes only the specified list of pins with existing latency offsets and overwrites the existing latency offsets. **Note**: • The `-override_existing_latencies_pins` and `-override_existing_latencies` parameters are mutually exclusive. • The `-override_existing_latencies_pins` and `-sum_existing_latencies` parameters are mutually exclusive. • The software issues an error if a pin is specified in both `-override_existing_latencies_pins` and `-sum_existing_latencies_pins` parameters.
`-pins` *pin_list*	
	Specifies the clock endpoint pins to consider. By default, the software considers all clock endpoints with the library `max/min_clock_tree_path` attributes. **Note**: The software issues an error if a pin is specified in either the `-sum_existing_latencies_pins` or the `-override_existing_latencies_pins` list, but the pin is not included in the list of pins specified using the `-pins` parameter.
`-sum_existing_latencies`	
	When specified, includes all pins with existing latency offsets and sums the existing latency offset with the library-specified offset. **Note**: • The `-sum_existing_latencies` and `-override_existing_latencies` parameters are mutually exclusive. • The `-sum_existing_latencies` and `-override_existing_latencies_pins` parameters are mutually exclusive. • The `-sum_existing_latencies` and `-sum_existing_latencies_pins` parameters are mutually exclusive.
`-sum_existing_latencies_pins` *pin_list*	
	Includes only the specified list of pins with existing latency offsets and sums the existing latency offset with the library-specified offset. **Note**: • The `-sum_existing_latencies_pins` and `-sum_existing_latencies` parameters are mutually exclusive. • The `-sum_existing_latencies_pins` and `-override_existing_latencies` parameters are mutually exclusive. • The software issues an error if a pin is specified to both `-sum_existing_latencies_pins` and `-override_existing_latencies_pins` parameters.

-views *view_list*	
	Specifies the analysis views to operate on. By default the software operates on all active analysis views.

Examples:

Example 1 – Two clocks, existing clock network latency, no pre-existing latency override

```
Circuit

ck1 ---> +-----+

         | mux | -----> icg --+--> flop1/CK   (regular flop pin without MCTP data)

ck2 ---> +-----+              +--> macro1/CK  (pin with MCTP data, of 0.222R/0.232F at 0.125 transition time)

                              +--> macro2/CK  (pin with MCTP data, of 0.333R/0.343F at 0.125 transition time)

create_ccopt_clock_spine

```
create_ccopt_clock_spine
[-help]
[-hard]
-name spinename
[-x x]
[-xmax xmax]
[-xmin xmin]
[-y y]
[-ymax ymax]
[-ymin ymin]
```

Creates a CCOpt spine object. A spine is a single vertical or horizontal line under which clock instance pins that exist in the prects netlist can be arranged. Spines must be either vertical with a single X value or horizontal with a single Y value. For example, to create a vertical spine, you need to specify a target X value, and a Y range. All distances are in microns. For example:

```
create_ccopt_clock_spine -name spineA -x 1000.0 -ymin 500.0 -ymax 1500.0
```

The software displays the following message:

```
Created clock spine: spineA
```

Note: Only those pins whose CCOpt property, `lock_on_clock_spine`, contains the name of the spine will be aligned to that spine. This property specifies a set of clock spine names restricting where the pin should be located. If the set contains more than one item, the pin may be placed on any of the specified clock spines. For more information about how this property is used, type the following:

```
get_ccopt_property -help lock_on_clock_spine
```

A spine may be specified as "hard", in which case it defines a rectangle, and cells will be moved out of this area, if possible, to make way for cells locked to the spine. For example:

```
create_ccopt_clock_spine -name spineB -hard -y 2000.0 -xmin 0.0 -xmax 3000.0 -ymin 1990.0 -ymax 2010.0
```

Note: When specifying a hard spine, the target X or Y value must lie between the specified edges.

⚠ This command is a part of the CCOpt spine functionality, which is a limited-access feature in this release. It is enabled by a variable specified through the `setLimitedAccessFeature` command. To use this feature, contact your Cadence representative to explain your usage requirements, and make sure this feature meets your needs before deploying it widely.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_ccopt_clock_spine` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_ccopt_clock_spine`.
`-hard`	If specified, creates a hard clock spine. This creates a rectangle and it causes other cells to be pushed out of the spine region bounds to make way for the cells locked to the spine.
`-name`	Specifies the user-defined identifier for this clock spine. This parameter is required.
`-x` *x*	Specifies the X value of a vertical clock spine's target line.
`-xmax` *xmax*	Specifies the maximum X value of objects on a horizontal spine, and the right edge of the hard spine area.
`-xmin` *xmin*	Specifies the minimum X value of objects on a horizontal spine, and the left edge of the hard spine area.
`-y` *y*	Specifies the Y value of a horizontal clock spine's target line.
`-ymax` *ymax*	Specifies the maximum Y value of objects on a vertical spine, and the top edge of the hard spine area.
`-ymin` *ymin*	Specifies the minimum Y value of objects on a vertical spine, and the bottom edge of the hard spine area.

Example

- The following command creates a hard, horizontal spine, with the specified target Y value, and the four edges of the rectangle to be cleared:

  ```
  create_ccopt_clock_spine -name -hard spineB -y 2000.0 -xmin 0.0 -xmax 3000.0 -ymin 1500.0 -ymax 2500.0
  ```

  The software displays the following message:

  ```
  Created clock spine: spineB
  ```

create_ccopt_clock_tree

```
create_ccopt_clock_tree
[-help]
[-name clockname]
[-no_skew_group]
-source pin
[-stop_at_sdc_clock_roots]
```

Defines a new clock tree within the design. You can define more than one clock tree and ordering of clock tree definitions is important. CCOpt can only optimize defined clock trees. When you run this command, CCOpt runs an algorithm known as clock tree extraction. Clock tree extraction examines the design starting at the root of a clock tree and decides which pins in the circuit are clock sinks for that tree and its clock gating and logical structure.

The `create_ccopt_clock_tree` command tells CCOpt that a part of the circuit is a clock tree. CCOpt then synthesizes the clock tree when you run the `ccopt_design` command. CCOpt treats clock trees and datapaths differently for power analysis purposes.

By default, defining a clock tree also creates associated skew groups.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_ccopt_clock_tree` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_ccopt_clock_tree`.
`-name clockname`	
	Specifies the user-defined identifier for the clock tree. This name should be unique. If this parameter is not specified, the software uses the name of the source pin by default.
`-no_skew_group`	
	Specifies that no default skew group will be defined for the sinks in the clock tree. If any skew groups are required, they will need to be defined manually using the `create_ccopt_skew_group` command.
`-source pin`	
	Specifies the name of the source pin of the clock tree in the design.
`-stop_at_sdc_clock_roots`	
	Specifies that clock tree definition should stop searching for parts of the clock tree through the root of SDC clocks.

Example

The following command creates a clock tree named "ck1" by tracking the clock path from the pin "clk":

```
create_ccopt_clock_tree -name ck1 -source clk
```

- The following topic in the *Innovus User Guide*
  - Clock Tree Concepts and Specifications

create_ccopt_clock_tree_source_group

```
create_ccopt_clock_tree_source_group
[-help]
-clock_trees clock_tree_list
-name clock_tree_source_group_name
```

Creates a clock tree source group. These source groups are used when a clock tree has multiple equivalent roots, and you want CTS to automatically swap sinks between roots to reduce insertion delay. It is required for flows where we are connecting one logical clock tree to multiple tap-off points from a top level H-tree or a mesh.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_ccopt_clock_tree_source_group` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_ccopt_clock_tree_source_group`.
`-clock_trees` *clock_tree_list*	Specifies a Tcl list of clock tree names that should be grouped together. CTS will attempt to swap sinks between these clock trees in order to balance the insertion delay under each clock tree's root and may clone clock logic to help this. This parameter is required. **Note:** This Tcl list is the same as that defined previously using the `create_ccopt_clock_tree` command.
`-name` *clock_tree_source_group_name*	
	Specifies the user-defined name for the new clock tree source group. The name must be unique. This parameter is required.

Example

- The following command creates a clock tree source group containing three clock trees: clk1, clk2 and clk3:
  ```
  create_ccopt_clock_tree_source_group -name clk_grp -clock_trees {clk1 clk2 clk3}
  ```

Related Information

- Clock Tree Synthesis chapter in the *Innovus User Guide*

create_ccopt_clock_tree_spec

```
create_ccopt_clock_tree_spec
[-help]
[-file filename]
[-keep_all_sdc_clocks]
[-views viewList]
```

Creates a clock tree network with associated skew groups and other clock tree synthesis (CTS) configuration settings such as ignore pins, case analysis, maxTrans, and so on based on a multi-mode timing configuration in the common timing engine (CTE).

When you run this command, one skew group will be created for each SDC clock in each constraint mode. Each such skew group will be able to take a skew target from any delay corner, but will have this target set to “ignore” unless there is an active analysis view that links the constraint mode for the skew group to that delay corner. The output of this command is a sequence of Innovus Tcl commands that can be edited manually.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_ccopt_clock_tree_spec` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man create_ccopt_clock_tree_spec`.

`-file` *`filename`*	Specifies the name for the clock tree specification script file. Providing the filename writes out the specified file. The file is not executed. To execute the file, run the following:
	`create_ccopt_clock_tree_spec -file spec.tcl`
	`source spec.tcl`
	Note: You can execute the file only once. If you run the above again, the software gives an error message:
	`source spec.tcl`
	`Cannot run clock tree spec: clock trees are already defined.`
	The already loaded specification file can be removed by using either of the following commands:
	• `delete_ccopt_clock_tree_spec`
	• `reset_ccopt_config`
	Note: If this parameter is not specified, the clock trees are defined by directly running clock tree extraction without the creation of a clock tree extraction script.

`-keep_all_sdc_clocks`	
	Specifies that all clocks and clock trees should be kept in 1:1 ratio, wherever possible. This means that CCOpt will maintain generated clock names for clock trees, even where these are functionally redundant, for example, clocks defined on buffer outputs. By default, CCOpt will not define these redundant clock trees.
`-views` *`viewList`*	Specifies the Tcl list of analysis view names. By default, the software considers all active analysis views.

Example

- The following example shows how running `create_ccopt_clock_tree_spec` defines clock trees by directly running clock tree extraction instead of creating a clock tree extraction script:

```
get_ccopt_clock_trees *
create_ccopt_clock_tree_spec
get_ccopt_clock_trees *
m_clk m_digit_clk m_dsram_clk m_ram_clk m_rcc_clk m_spi_clk refclk<1> refclk
```

create_ccopt_flexible_htree

```
create_ccopt_flexible_htree
[-help]
[-adjust_sink_grid_for_aspect_ratio {true | false}]
-final_cell base_cell
[-hv_balance {true | false}]
[-image_directory dirName]
[-inverting]
[-layer_density value]
[-max_driver_distance value]
[-max_root_distance value]
[-mode {drv | distance}]
-name flexibleHtreeName
[-omit_symmetry string]
[-partition_boundary_polarity {non_inverting | inverting | ignore}]
[-partition_groups {{partition ...} [max_boundary_net_length] [inverting | non_inverting] [subtree] ...}]
[-power_weight value]
-pin {pin | port}
[-sink_grid {columns rows}]
[-sink_grid_box {xmin ymin xmax ymax}]
[-sink_grid_exclusion_zones {{xmin ymin xmax ymax} ...}sink_grid_exclusion_zones]
[-sink_instance_prefix prefixName]
[-sink_grid_sink_area {width height}]
[-sinks {{pin_name | {xmin ymin xmax ymax}} ...}]
[-stop_at_sdc_clock_roots]
-trunk_cell base_cell
```

Creates a design object for a flexible H-tree, under the specified pin. The H-tree is adjusted to consider placement and routing blockages, and any power routing.

You can specify this command in a sequence to create multiple flexible H-trees.

Note: This command does not synthesize flexible H-trees. After creating or defining flexible H-trees using this command, use the `synthesize_ccopt_flexible_htrees` command to synthesize all the flexible H-trees created using this command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_ccopt_flexible_htree` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_ccopt_flexible_htree`.
`-adjust_sink_grid_for_aspect_ratio {true | false}`	
	When set to true, adjusts the sink grid for aspect ratio. *Default*: `true`
`-image_directory dirName`	

	Specifies the name of the directory to which the images generated by the H-tree synthesis algorithm are written. The images are PNG files. Color coding of images is provided below: White: Unobstructed edges of the synthesis grid Red: Grid points that are blocked for trunk cell placement in all modules Orange: Grid points that are blocked for final cell placement in all modules Red orange: Grid points that are blocked for trunk and final cell placement in all modules Yellow circle: The grid point of the source Yellow points: Candidate grid points of H-tree sinks Yellow rectangle: The sink area containing target grid point candidates of H-sinks, adjusted to the synthesis grid Brown: If specified, the sink grid box snapped to the synthesis grid Green/blue: The edges of the synthesized H-tree Purple: H-tree repeaters Cyan: Partition boundaries in hierarchical designs
`-final_cell` *`base_cell`*	
	Specifies the library cell (buffer or inverter) to use for the ends of the clock tree.
`-hv_balance {true | false}`	
	When set to `true`, specifies that the horizontal and vertical metal wires can only be balanced against other wires of the same orientation. When set to `false`, specifies that any wire can be balanced against any other wire. Default: `true`
`-inverting`	
	Specifies whether the tree will invert its input or not. By default, this parameter is not enabled.
`-layer_density` *`value`*	
	Specifies the layer density used to compute the parasitics for timing estimates of H-tree nets.
`-max_driver_distance` *`value`*	
	When specified, the software ignores DRVs and uses the given value as the maximum length of the nets connecting the H-tree drivers.
`-max_root_distance` *`value`*	
	When specified, the software ignores DRVs and uses the given value as the maximum length of the net connecting the root and the first driver of the H-tree. This value can only be specified if the `-max_driver_distance` parameter is also specified.
`-mode {drv | distance}`	

	Specifies the driver insertion mode. When set to `drv`, drivers are inserted to avoid DRVs. When set to `distance`, the parameters, `-max_driver_distance` and `-max_root_distance` determine the maximum net lengths allowed. Transitions and delays are not computed in this case. *Default*: `drv` **Note**: When this parameter is set to `distance`, the `-max_driver_distance` and `-max_root_distance` parameters must be specified.
`-name` *flexibleHtreeName*	
	Specifies the name of the flexible H-tree to be created. This parameter is required.
`-omit_symmetry` *string*	
	Specifies that no symmetry drivers and/or branches should be added to balance the pin load of nets in the flexible H-tree. Symmetry drivers are drivers that are added to balance pin capacitances at branch points. For example, if buffer pairs are inserted at branch points, one of these buffers may not drive any fanout and is inserted to match other buffer pairs at the same level of the flexible H-tree. Omitting symmetry drivers can reduce the power of the H-tree but increase its skew. Drivers that are added to terminate symmetry branches do not count as symmetry drivers and are never omitted. Similarly, symmetry branches are branches that are needed to balance the wire load at branch points. They are added to match other branchpoints at the same level of the flexible H-tree. Symmetry branches are always terminated with drivers, which are not counted as symmetry drivers. Possible values for this parameter are: `false`: Add symmetry branches and drivers `true`: Omit both symmetry drivers and branches `drivers`: Omit symmetry drivers `branches`: Omit symmetry branches `{drivers branches}`: Omit both symmetry drivers and branches `{}`: Add symmetry branches and drivers By default, symmetry branches and buffers are added.
`-partition_boundary_polarity {non_inverting | inverting | ignore}`	
	Specifies the polarity of the clock signal with regard to the source of the flexible H-tree when entering partitions. The following values are allowed: • `non_inverting`: When specified, allows only non-inverting polarity at partition entry points. • `inverting`: When specified, allows only inverting polarity at partition entry points. • `ignore`: When specified, allows inverting and non-inverting polarity at partition entry points. *Default*: `non_inverting`
`-partition_groups {{`*partition* `...} [max_boundary_net_length] [inverting | non_inverting] [`*subtree*`] ...}`	

	Specifies the groups in which partitions are clustered in channelless designs. Nested lists imply allowed crossings between groups. Each group has zero or one input port and each partition must only be specified once. Optionally, a maximum pre-route net length from the boundary of a partition group can be specified. The maximum pre-route net length must be specified as the second parameter of a nested partition group. Optionally, the next argument specifies the clock phase when entering the partition group in relation to the root pin of the H-tree. Allowed values are 'inverting' and 'non_inverting'. If no value is specified, the clock phase is unconstrained. The clock phase is unconstrained when crossing the boundaries of partitions within the same group. All specified clock phases must be either inverting or non_inverting. For example, if the following partitions are specified: `{{A} {{C D} 50 non_inverting {{E F}} {{G}}}}` It means the following: • The H-tree starts in partition A and descends into group C/D. • From partition group C/D, the tree descends into groups E/F and G. • Any clustering of sinks inside the C/D and E/F groups is allowed, potentially crossing internal partition boundaries several times. • Partition A has no clock input port and one clock output port • Partition group C/D has one clock input port and two clock output ports • Partition group E/F and G have one clock input port and no clock output port • The maximum net length from the entry point into partition group C/D is 50um (pre-route) • The clock phase is non_inverting when entering parition group C/D. The clock phase is unconstrained when entering other partition groups Default: `{}`
`-power_weight` *value*	
	Specifies the power versus insertion delay trade-off. Valid values are between 0 and 1, specifying the weight that is put on power optimization during the synthesis of flexible H-trees. *Default*: `1`
`-pin {pin | port}`	
	Specifies the pin under which to create the flexible H-tree. This parameter is required.
`-sink_grid {columns rows}`	
	Specifies the columns and rows of a grid of H-tree sinks. The columns and rows may be swapped if the `-adjust_sink_grid_for_aspect_ratio` parameter is set to `true`. **Note**: This parameter is not supported in master/clone designs.
`-sink_grid_box {xmin ymin xmax ymax}`	
	Specifies the area of the box that the grid of H-trees should cover.
`-sink_grid_exclusion_zones {{`*xmin ymin xmax ymax*`} ...}`	
	Specifies zones from which sinks of the sink grid are excluded if the zones completely cover the respective sink area.
`-sink_grid_sink_area {width height}`	

	Specifies the approximate size of the rectangle describing valid locations for final cells, specified using the `-final_cell` parameter, per H-tree sink in the grid.
`-sink_instance_prefix` *prefixName*	
	Specifies the prefix used for instance names of final cells, specified using the `-final_cell` parameter and the sinks specified using the `-sinks` parameter.
`-sinks {`*pin_name* `|` `{` *xmin ymin xmax ymax* `}}`	
	Specifies approximate rectangular sink regions for the buffer locations at the end of the tree, which are specified using the `-final_cell` parameter or pins. The specified pins must be in the clock tree. Nested lists imply clustering relationships.
`-stop_at_sdc_clock_roots`	
	Specifies that the clock tree definition should stop searching for parts of the clock tree at the root of SDC clocks.
`-trunk_cell` *base_cell*	
	Specifies that this cell should be used for the buffers inside the flexible H-tree. This parameter is required.

Examples

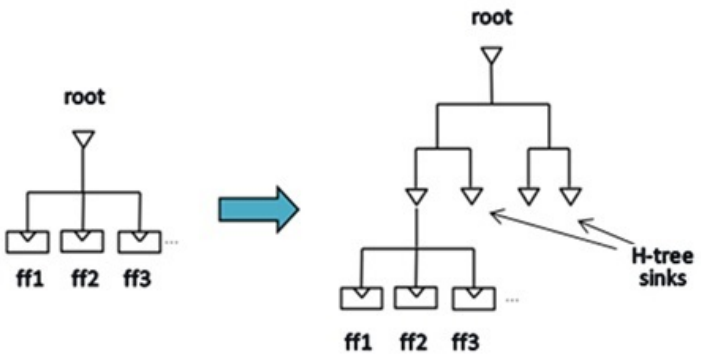
- The following command creates a flexible H-tree for four sinks under the the pin "`root/Y`". The sinks of the H-tree will be of type `BUFX16` and placed approximately inside the specified sink rectangles. Other buffers added to the H-tree will be of type `BUFX8`. No symmetry buffers are added to balance the pin load of nets. The flexible H-tree is then synthesized using the `synthesize_ccopt_flexible_htrees` command.

  ```
  create_ccopt_flexible_htree -name tree0 -pin root/Y -sinks { {200 200 300 300} {200 700 300 800} {700 200 800 300} {700 700 800 800} } -final_cell BUFX16 -trunk_cell BUFX8 -omit_symmetry drivers
  synthesize_ccopt_flexible_htrees
  ```

- The following commands create two flexible H-trees under the pins "`rootA/Y`" and "`rootB/Y`". The sinks will be of the type `INVX8` and will be placed in the specified sink grids. Other buffers added to the H-trees will be of type `INVX12`. Symmetry buffers are omitted to balance the pin load of nets. The flexible H-trees are then synthesized using the `synthesize_ccopt_flexible_htrees` command.

  ```
  create_ccopt_flexible_htree -name htreeA -pin rootA/Y -sink_grid {2 2} -final_cell INVX8 -trunk_cell INVX12 -omit_symmetry drivers
  create_ccopt_flexible_htree -name htreeB -pin rootB/Y -sink_grid {4 4} -final_cell INVX8 -trunk_cell INVX12 -omit_symmetry drivers
  synthesize_ccopt_flexible_htrees
  ```

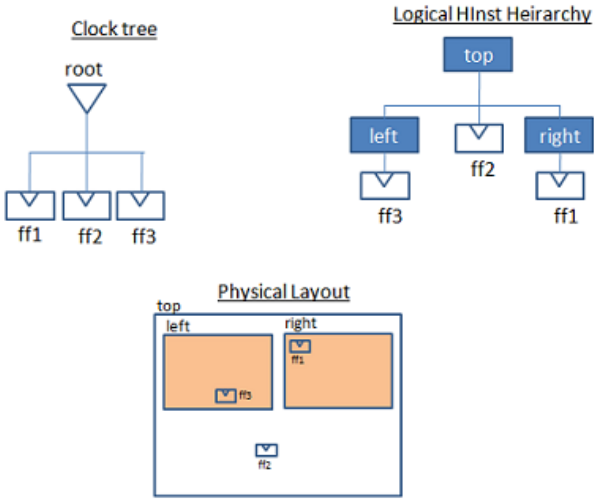
Note: During flexible H-tree synthesis a number of buffers (or inverters) are created. In designs with no fence regions, every instance in the flexible H-tree, including all H-tree sinks, are assigned to the top-level hInst. In this case, the `create_ccopt_flexible_htree` command moves the original fanout of the root pin of the flexible H-tree to a single H-tree sink as shown in the image below.



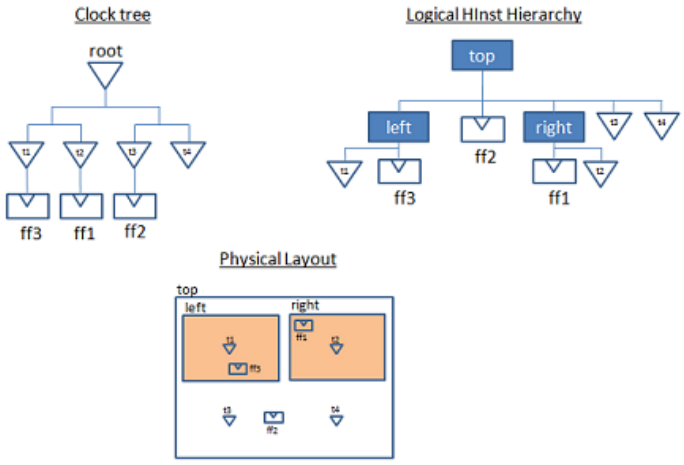
In designs where there are fence regions, the command chooses hInsts for instances in the flexible H-tree considering fence region constraints. The fanout of the root pin of the flexible H-tree is connected to H-tree sinks that best match the hInst to which a fanout instance belongs.

The images below illustrate a clock tree with three clock tree sinks, ff1, ff2, and ff3 and three hInsts, "top", "left", and "right". The hInsts "left" and "right" are fenced. Fenced regions are shown in pale orange. Sink ff1 is in hInst "right", ff2 is in the top-level hInst, and ff3 is in hInst "left". The hInsts "left" and "right" are children of the top-level hInst. After flexible H-tree synthesis there are four H-tree sink instances, t1, t2, t3, and t4 laid out in a square such that t1 is in the fence region for the hInst "left", t2 is in the fence region for the hInst "right", and the other two are in hInst "top". The flops have been connected to H-tree sinks that match their fence constraints. Note that when running `ccopt_design` after creating the flexible H-tree, multi-tap CTS may reconnect ff2 to t4 rather than t3.

Before H-tree Synthesis



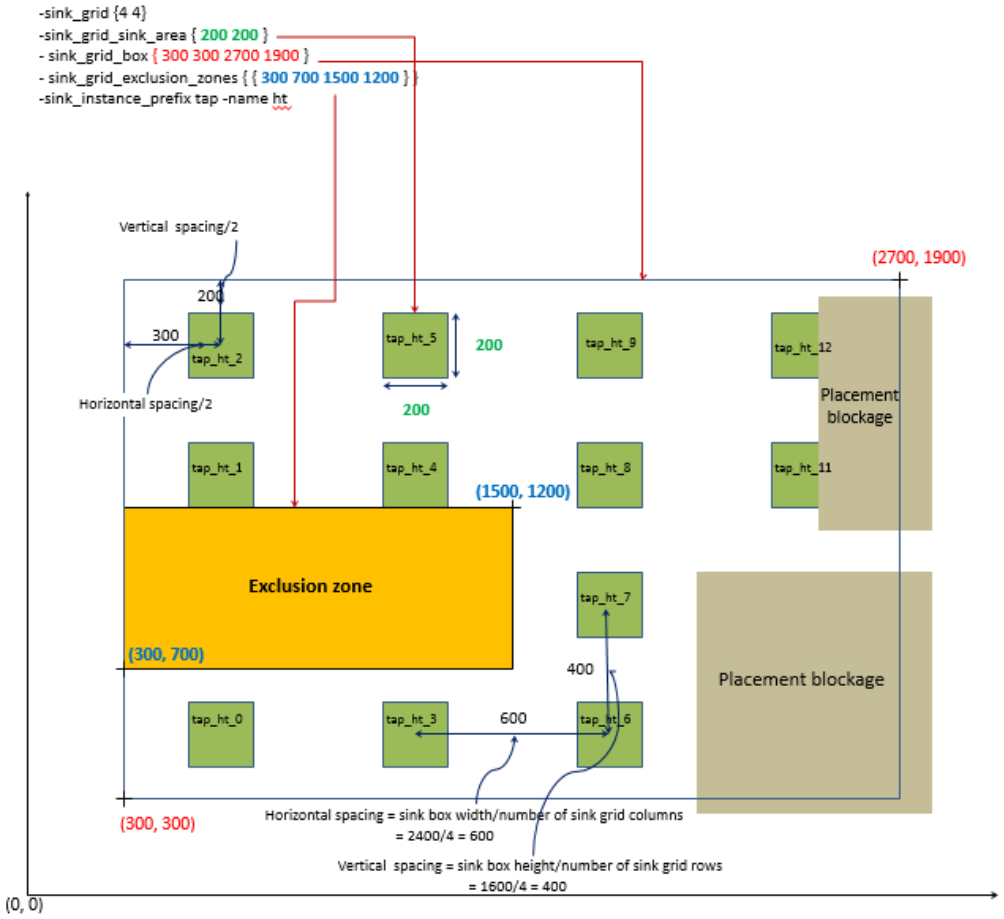
After H-tree Synthesis



Using the Sink Grid Parameters

The diagram below illustrates the usage of the sink grid parameters of this command. Note the following:

- The sink grid is specified as {4 4}, which means it will have four columns and four rows
- No H-tree sinks are created for sink areas that are completely covered by placement blockages or exclusions zones
- H-tree sink instances with the name specified in the diagram will be placed inside the unblocked parts of the sink areas
- The sink grid is adjusted by snapping it to the synthesis grid, which means that the specified sink areas are treated only as a guide



Related Properties

create_ccopt_generated_clock_tree

```
create_ccopt_generated_clock_tree
[-help]
[-generated_by pins]
[-name clockname]
[-parents parents]
[-search_method method]
-source pin
[-stop_at_sdc_clock_roots]
```

Defines a generated clock tree within the design. Use this command if you want to balance the sinks in the generated tree against those in the parent trees. CCOpt accomplishes this action by pulling up any sinks in the parent trees that contribute directly to the generated clock tree. The insertion delay under such sinks in the parent trees will be set to the insertion delay of the generated clock tree plus the delay between the sink pin and the source of the generated clock tree.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_ccopt_generated_clock_tree` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_ccopt_generated_clock_tree`.
`-generated_by pins`	Specifies the sink pins in the parent clock trees for which the delay between the parent and generated clock trees should be considered. If this parameter is not specified, all possible timing paths between sinks in the parent tree and the source of the generated clock tree will be considered. This parameter is mutually exclusive with the `-search_method` parameter.
`-name clockname`	Specifies the user-defined identifier for the generated clock tree. This name should be unique. If this parameter is not specified, the software uses the name of the source pin by default.
`-parents parents`	Specifies the parent clock trees for the generated clock trees. This parameter should be specified if the parents are ambiguous.

`-search_method {same_instance multi_stage}`	Specifies the search methdology to be used when tracing the path to the generator inputs.
	`multi_stage`
	This is the default method, and will select the current behavior of the software. When this method is specified, the software searches backwards through all the delay paths leading into the clock root pin, looking for pre-existing clock sinks. Every such clock sink found is a candidate generator input for the generated clock tree. This includes clock sinks that lie on different instances to the root pin - where multiple stages lie between the clock sink and the root pin. Additional filtering on the candidate generator inputs is applied by the `-parents` parameter to avoid producing cycles in the clock tree structure. Once the set of generator inputs is finalized, the delay path between each finalized generator input and the clock root pin is imported into the CCOpt clock tree data stuctures. If the generator input lies on a different instance of the clock root pin, ClockGeneratorPathNode objects are created.
	`same_instance`
	This method is similar to the `multi_stage` method, except that the software restricts its search to consider only clock sinks that lie on the same instance as the generated clock tree's root pin. This means that the software does not traverse net arcs looking for generator input clock sinks. Consequently, ClockGeneratorPathNode objects will not be needed to model any generator path.
	Note:
	• This functionally is identical to specifying the `-generated_by` parameter that lists all the clock sinks on the same instance as the clock root pin. However, it avoids the need to explicitly identify those clock sinks.
	• Irrespective of the search method, if no candidate generator clock sink is found, or if there are no valid generator inputs discovered in the set of clock sinks, creation of the generated clock tree fails with an error.
	The software uses `multi_stage` method by default.
	This parameter is mutually exclusive with the `-generated_by` parameter.

`-source pin`	Specifies the name of the source pin of the generated clock tree. This is a required parameter.
`-stop_at_sdc_clock_roots`	Specifies that clock tree definition should stop searching for parts of the clock tree through the root of the SDC clocks.

Example

- The following command defines a generated clock tree `clk_div_2`, which is generated from the `gen_clk/CK` clock pin, using the `gen_clk.QN` pin as the source pin:
```
create_ccopt_generated_clock_tree -name clk_div_2 -source gen_clk/QN -generated_by gen_clk/CK
```

create_ccopt_macro_model_spec

```
create_ccopt_macro_model_spec
[-help]
[-ckSpec]
[-ediCtsSpecForMacroModels fileName]
[-file filename]
```

This command is used to view, or edit, the pin insertion delays for CCOpt derived from the macro model specification. The macro model information for CCOpt can be retrieved by providing the name of the specification file that contains the macro model information .This command allows the macro model to CCOpt pin insertion delay conversion in a way that gives you the pin insertion delay in a TCL format that you can edit and then integrate into your scripts.

Note: To run this command, ensure that the design is loaded and the specification file is available. Once the macro model specification file is created, to use this file, you only need to source it after the running the `create_ccopt_clock_tree_spec` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_ccopt_macro_model_spec` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_ccopt_macro_model_spec`.
`-ckSpec`	Uses the CCOpt CTS specification file for macro model information.
`-ediCtsSpecForMacroModels fileName`	
	Specifies the legacy FE-CTS specification file for macro model information.
`-file filename`	Exports the CCOpt macro model spec to the specified file.

Example

- The following command is used to create the macro model specification file, CCOPT_MM, using the legacy FE-CTS specification file, `CTSSPEC`, in the CCOpt-CTS and CCOpt flow:

  ```
  create_ccopt_macro_model_spec -ediCtsSpecForMacroModels CTSSPEC -file CCOPT_MM
  ```

- The following command is used to create the macro model specification file, CCOPT_MM, in the CCOpt-CTS flow driven directly by the legacy FE-CTS specification file (`CTSSPEC`):

  ```
  create_ccopt_macro_model_spec -ediCtsSpecForMacroModels CTSSPEC -file CCOPT_MM -ckSpec
  ```

create_ccopt_preferred_cell_stripe

```
create_ccopt_preferred_cell_stripe
[-help]
-bbox {xmin xmax ymin ymax}
-cells list_of_cells
-name name
```

This command creates an object that corresponds to a single preferred_cell_stripe. The object represents a constraint where CCOpt tries to place instances of the specified cells within the specified bounding box of the stripe. When several of these objects are created, CTS tries to place instances within the bounding boxes of the stripes, choosing the stripe that yields the best quality of result.

The object must be created before running `ccopt_design`. This command is used when you want to place large CTS cells, which induce a large IR drop, close to the power switches that are often arranged in repeated vertical columns on the chip.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_ccopt_preferred_cell_stripe` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_ccopt_preferred_cell_stripe`.
`-bbox bbox`	
	Specifies the area of the bounding box. Cell instances within this box will be preferentially placed on the stripes, if their library cell appears in the cell list associated with the stripes instance.
`-cells list_of_cells`	
	Specifies the list of library cells that should be placed on preferred cell stripes.
`-name name`	
	Specifies the user-defined identifier for these preferred cell stripes.

create_ccopt_skew_group

```
create_ccopt_skew_group
[-help]
[-constrains cts | ccopt_initial | ccopt | subset_of_values | all | none]
[-from_clocks clock_names]
[-from_constraint_modes constraint_mode_names]
[-from_delay_corners delay_corner_names]
-name skew_group_name
[-rank rank]
[-sinks pins | -shared_sinks pins | -exclusive_sinks pins | -auto_sinks | -filtered_auto_sinks pins | -
balance_skew_groups skew_groups]
[-sources pins | -balance_skew_groups skew_groups]
[-target_insertion_delay value]
[-target_skew value]
```

Creates a new skew group within the design. CCOpt balances clock trees according to skew group requirements. Balancing between multiple trees can be achieved using the `-sources` parameter. The sinks to be balanced can either be specified explicitly using the `-shared_sinks` or `-exclusive_sinks` parameters or can be automatically inferred by using the `-auto_sinks` parameter.

Every skew group is assigned a rank, accessible through the `exclusive_sinks_rank` property:

- **Shared skew groups** always have an `exclusive_sinks_rank` value of zero.
- **Exclusive skew groups** always have an `exclusive_sinks_rank` value greater than zero. When an exclusive skew group is created, CCOpt assigns that exclusive skew group a rank one greater than the highest existing skew group.

The rank of a skew group determines whether a member pin is an active sink in that skew group or not. A pin is only an active sink in the skew group(s) with the highest rank, out of all the skew groups to which the pin belongs. An active sink is a pin that will be balanced against other active sinks in the same skew group.

For example, consider the following sequence of commands:

1. `create_ccopt_skew_group -name SG1 -sources top -shared_sinks [get_ccopt_clock_tree_sinks */CK]`
2. `create_ccopt_skew_group -name SG2 -sources top -exclusive_sinks [get_ccopt_clock_tree_sinks *XYZ*/CK]`
3. `create_ccopt_skew_group -name SG3 -sources top -exclusive_sinks [get_ccopt_clock_tree_sinks *XYZ_01*/CK]`

After running the first command, a single skew group `SG1` is created. This is a shared skew group, so has an `exclusive_sinks_rank` value of zero. All the "`CK`" pins in the design are members of this skew group. In addition, all the "`CK`" pins are active sinks in skew group `SG1`. This is because `SG1` is the highest ranked skew group so far, even though it has a rank of zero.

The second command defines an exclusive skew group `SG2`. This is given an `exclusive_sinks_rank` value of 1, which is one higher than the current highest rank of 0. Sinks that match the pattern `*XYZ*/CK` are now members of both `SG1` and `SG2`. However, they are only active sinks in `SG2`, which is the highest ranked parent skew group till now. Sinks that don't match this pattern remain active pins in `SG1`.

The third command defines another exclusive skew group, `SG3`. This is given an `exclusive_sinks_rank` value of 2, which is one higher than the current highest rank of 1. Sinks that match the pattern `*XYZ_01*/CK` (which must also be members of `SG2`, since those sinks would also match the pattern `*XYZ*/CK`) are now members of skew groups `SG1`, `SG2`, and `SG3`. However, they are only active sinks in `SG3`, which is the highest ranked parent skew group. Sinks that matched the pattern `*XYZ*/CK` but not `*XYZ_01*/CK` are members of both `SG1` and `SG2` but only active sinks of `SG2`. Sinks that don't match the pattern `*XYZ*/CK` are members of `SG1` and active sinks in `SG1`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_ccopt_skew_group` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_ccopt_skew_group`.
`-auto_sinks`	When specified, determines the target sinks for the skew group based on the input pins reachable from the source.
`-balance_skew_groups` *skew_groups*	
	Specifies that the new skew groups should be created by merging the specified skew groups in order to balance them together as a single skew group. **Note**: The sources of skew groups are specified using the `-sources` parameter. However, if the `-sources` parameter is not specified and you are using the `-balance_skew_groups` parameter, then the sources are the sources of the skew groups that are specified using this parameter.
`-constrains cts | ccopt_initial | ccopt | subset_of_values | all | none`	
	Specifies whether the skew group should constrain `cts, ccopt_initial, ccopt, a subset of these values, all`, or `none`. If the value includes cts, the created skew group will constrain `cts`, if the value includes `ccopt_initial`, the created skew group will be used to constrain CCOpt's initial solution.If the value includes `ccopt`, the created skew group will constrain CCOpt's final solution.
`-exclusive_sinks` *pins*	
	Specifies the input pins in the design that CCOpt should consider as members of the new skew group. This will give the new skew_group an `exclusive_sinks_rank` 1 greater than any other currently defined skew group, effectively removing the pins from all skew_groups that they currently belong to. If both "`shared_sinks`" and "`exclusive_sinks`" are not specified, CCOpt will use the set of sinks reachable from the source if the `auto_sinks` switch is provided, or no sinks otherwise.
`-filtered_auto_sinks` *pins*	
	Specifies that the target sinks should be determined automatically from the subset provided. The target sinks for the skew group are determined based on the input pins reachable from the source. However, of these pins, only those are selected that are also present in the list of pins provided as a filter.
`-from_clocks` *clock_names*	
	Specifies the name of the clock for which this skew group was extracted.
`-from_constraint_modes` *constraint_mode_names*	
	Specifies the constraint mode for which this skew group was extracted.
`-from_delay_corners` *delay_corner_names*	
	Specifies the delay corners associated with the constraint modes for which this skew group was extracted.
`-name` *skew_group_name*	
	Specifies the user-defined name for the new skew group. The name must be unique.
`-rank` *rank*	Specifies the exclusive_sinks_rank for this skew group.
`-shared_sinks` *pins*	

	Specifies the input pins in the design that CCOpt should consider as members of the new skew group but are also shared with other skew groups. These pins are members of both the original skew group and the new skew group. This implies a `exclusive_sinks_rank` of 0.
`-sinks` *pins*	Specifies the input pins in the design that CCOpt should consider as members of the new skew group.
`-sources` *pins*	Specifies the source pins of the skew group.
`-target_insertion_delay` *value*	
	Specifies the target insertion delay to be used for the skew group. CCOpt attempts to keep the latency of all sinks within half the target skew on either side of this delay. For example, `create_ccopt_skew_group -name b1 -sources b1 -exclusive_sinks {A/CK B/CK G/CK} -target_insertion_delay 0.3ns -target_skew 0.1ns`
`-target_skew` *value*	

	Specifies the skew that the clock tree synthesis should aim for. It sets the `target_skew` property for the created skew group (`set_ccopt_property target_skew` *value*). If this parameter is not set, the software will use the default value that it gets from `get_ccopt_property target_skew`.
	For example:
	`get_ccopt_property target_skew`
	The software returns the following value:
	`2`

Example

- The following command creates the specified skew group, `clk_disable`, for the specified source and exclusive sinks:

```
create_ccopt_skew_group -name clk_disable -sources clk -exclusive_sinks {mod/ff1/CK mod/icg/CK}
```

create_route_type

```
create_route_type
[-help]
[-em_ndr_dist float]
[-em_ndr_rule rule_name]
[-min_stack_layer layer]
-name string
[-one_side_spacing_range bottomLayerNum:topLayerNum]
[-prefer_multi_cut_via]
[-shield_side {one_side | both_side}]
[-shield_tap_instance_insertion_effort {none | standard | high}]
[-stack_distance float]
[[-non_default_rule ndr_name] [-shield_net net_name] [-top_preferred_layer layer] [-bottom_preferred_layer layer]
[-preferred_routing_layer_effort {low | medium | high}]]
[-mask mask_number [-layer_mask_range bottomLayerNum:topLayerNum]]
```

Creates a new route type and sets the routing properties for the nets. This command lets you create the standard `route_type` that defines a collection of routing attributes such as non-default rule (NDR), shield net, preferred layers and so on that can then be applied to either all leaf or all trunk nets for a particular clock tree. The type of route_type object created depends on the parameters you specify with this command. A standard route_type object is created if you specify the `-non_default_rule, -shield_net, -top_preferred_layer` or `-preferred_routing_layer` parameters.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_route_type` parameter. For a detailed description of the command and all of its parameters, use the man command: man `create_route_type`
`-bottom_preferred_layer` *`layer`*	Specifies the preferred lowest routing layer. This attribute is a soft limit, which means, NanoRoute might use a layer below the specified layer if necessary to complete routing. A layer name can be any real layer name, for example, from LEF or OpenAccess. Routing layer names can also be abbreviated as 1 or metal1 for the first routing layer, 2 or metal2 for the second routing layer, and so on. Note, the software will check for real layer names first. So, if metal1 matches a real layer name it might not be the first routing layer. If not specified, the router will freely route the net starting on the first routing layer, with no preference for higher layers.
`-em_ndr_dist` *`float`*	Specifies the distance related to the output pin, when `em_ndr_rule` is applied to the net. When routing outside this distance range, the router either uses regular wire or regular non-default routing (NDR), if the regular NDR setting is enabled in this net. **Note:** When the `-em_ndr_rule` option is used with the command, the `-em_ndr_rule` option becomes mandatory.
`-em_ndr_rule` *`rule_name`*	Specifies the EM NDR rule to associate with this route type. When routing within the distance specified in `-em_dist` from output pin, router will use this ndr rule to route. *Default:* No EM NDR rule
`-layer_mask_range` *`bottomLayerNum:topLayerNum`*	Specifies the layer range that the mask constrain should be applied on. For example, 3:4 means that the constrain should be applied on metal3 and metal4.
`-mask mask_number`	Specifies the mask number in allowed range (min=0, max=3).
`-min_stack_layer` *`layer`*	Specifies that the output pins of the net use stacked vias from the pin to the given *`layer`* and the rest of the connections start from the mentioned *`layer`*.
`-name` *`string`*	Specifies the name of the route type object. This is required.
`-non_default_rule` *`ndr_name`*	Specifies the non-default routing (NDR) rule to associate with this route_type. Default is no NDR rule.
`-one_side_spacing_range` *`bottomLayerNum:topLayerNum`*	Specifies the layer range that one side spacing constrain should be applied on. By default, NDR spacing is applied to both sides of an NDR net or wire. Use this option to specify the layer range for wires that have only one neighboring wire with minimum spacing, which means only one side needs to follow larger NDR spacing.
`-prefer_multi_cut_via`	Specifies whether or not to use the multi-cut vias for connections at the net driver pins.

`-preferred_routing_layer_effort {low | medium | high}`	Specifies whether the preferred routing layer effort will be low, medium or high. This parameter determines how flexible the NanoRoute router is when setting layer limits for routing specified nets. Use this parameter with the `-top_preferred_routing_layer` and `-bottom_preferred_routing_layer` parameters. Specify `medium` or `high` routing layer effort level to make NanoRoute less flexible in setting layer limits for routing specified nets. NanoRoute will obey the preferred routing layer range more strictly. Specify `low` to make NanoRoute more flexible in setting layer limits for routing specified nets. *Default*: `high`
`-shield_net` *net_name*	Specifies a special net to use as a shield for a critical or high-speed net. Typically, a shielded net is routed before routing other net. You can specify only one shield net. However, you cannot control which side is used by the special net that is routed on the same layer as the signal routing. The shield terminates near the pin. If not specified, the net is not shielded.
`-shield_side {one_side | both_side}`	Specifies whether to perform one sided or two sided shielding for the route type specified.
`-shield_tap_instance_insertion_effort {none | standard | high}`	Specifies the clock route type for clock shielding of the high and low frequencies through the `high` and `standard` values respectively. The main difference between these values is related to the ground that the tie cell instance/via uses to achieve shield segments of the electrical connection.
`-stack_distance` *float*	Specifies that the cut distance of cuts on adjacent layers in the stacked vias are defined in `-min_stack_layer`.
`-top_preferred_layer` *layer*	Specifies the top-preferred layer for the route type.

Example

For example, use the following commands to create the standard route_types that specify the routing attributes we want to assign to particular nets:

```
create_route_type -name RT1 -non_default_rule NDR1
create_route_type -name RT2 -non_default_rule NDR2
create_route_type -name RT3 -non_default_rule NDR3 -top_preferred_layer M4 -bottom_preferred_layer M3
create_route_type -name RT4 -non_default_rule NDR4 -preferred_routing_layer_effort high -top_preferred_layer M4 -
bottom_preferred_layer M3
```

cts_refine_clock_tree_placement

```
cts_refine_clock_tree_placement
[-help]
```

Performs clock placement refinement with cell halos. Use this command at the end of CTS to ensure that all clock cells are placed legally and obey cell halo and density constraints. You can use `report_ccopt_cell_halo_violations` to report any clock halo constraint violations. Then run `cts_refine_clock_tree_placement` to fix any reported violations. You can re-run the `report_ccopt_cell_halo_violations` command to verify that these instances have been fixed.

Parameter

`-help`	Outputs a brief description for the `cts_refine_clock_tree_placement` command parameter. For a detailed description of the command, use the man command: `man cts_refine_clock_tree_placement`.

Example

The following set of commands show that halo violations are reported with `report_ccopt_cell_halo_violations` command, then the `cts_refine_clock_tree_placement` command performs clock placement refinement with cell halos and then `report_ccopt_cell_halo_violations` is re-run to verify that the instances have been fixed:

```

ctd_save_histogram

```
ctd_save_histogram
[-help]
[-csv]
-file fileName
[-id windowID]
```

Saves the CTD histogram to a file. By default, the file type is PNG. You can also specify that the file be saved in the CSV format.

Before using this command to save the histogram view, first open and configure the histogram in the GUI, including skew group and delay corners.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `ctd_save_histogram` parameter. For a detailed description of the command and all of its parameters, use the man command: man `ctd_save_histogram`.
`-csv`	Saves the histogram in CSV format. This parameter is optional. By default, the histogram is saved as a PNG file.
`-file` *fileName*	Specifies the name of the file where you want to save the histogram. This parameter is required.
`-id` *windowIDName*	Specifies the ID of the active CTD window. The default value is the ID of the current active window.

Example

The following command saves the histogram in the `histogram1.csv` file.

```
ctd_save_histogram -file histogram1 -csv
```

ctd_save_view

```
ctd_save_view
[-help]
-file fileName
[-id windowID]
[-legend_on]
[-type {PNG | GIF}
```

Saves the current snapshot of the clock tree viewer into a file.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `ctd_save_view` parameter. For a detailed description of the command and all of its parameters, use the man command: man `ctd_save_view`.
`-file fileName`	Specifies the name of the file where you want to dump the display image. This parameter is required.
`-id windowIDName`	Specifies the window ID whose display is to be saved. The default value is the returned value of command `get_ctd_win_id`.
`-legend_on`	Saves the whole window including the panels that are open.
`-type {PNG | GIF}`	Specifies whether the format of the image should be GIF or PNG. The default format is PNG.

Example

The following command saves the view snapshot in the `snapshot1.png` file.

```
ctd_save_view -file snapshot1 -type PNG
```

ctd_show_skew_group

```
ctd_show_skew_group
[-help]
[-id window_id_name]
-skew_group skew_group_name
```

Shows the specified skew group in the CTD window.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `ctd_show_skew_group` parameter. For a detailed description of the command and all of its parameters, use the man command: man `ctd_show_skew_group`.
`-id window_id_name`	Specifies the CTD window ID. The default value is the ID of the current active CTD window.
`-skew_group skew_group_name`	Specifies the name of the skew group. This is a required parameter.

Example

Use the following command to show the specified skew group in the CTD window:

```
ctd_show_skew_group -skew_group m_rcc_clk/PM_HL_FUNC
```

ctd_trace

```
ctd_trace
[-help]
[-color colorname]
[-file fileName]
[-from rootclock]
[-index colorindex]
[-to sink | -through instancename]
```

Highlights the clock tree path from the clock root to the pin or from one pin to the other if the two pins are on the same path using the specified color or color index. The highlighted clock tree path can be viewed in the Clock Tree Viewer of the CCOpt Clock Tree Debugger (CTD). You can also use the Highlight Clock Path option in the context menu of the CTD to highlight the complete clock tree path of a selected pin to the clock root.

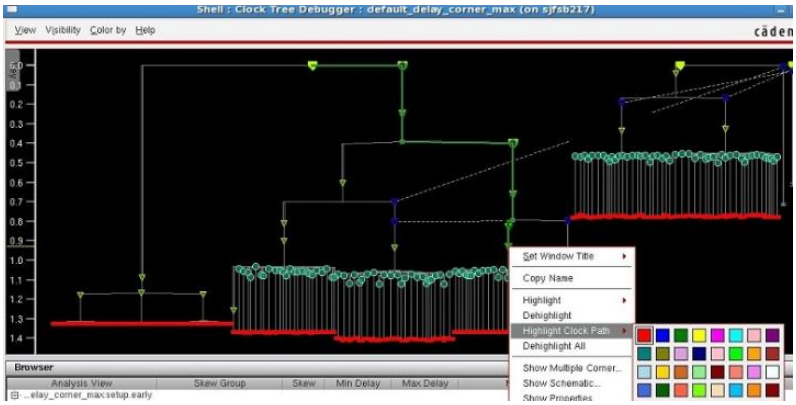
Parameters

`-help`	Outputs a brief description that includes type and default information for each `ctd_trace` parameter. For a detailed description of the command and all of its parameters, use the man command: man `ctd_trace`.
`-color` *`colorname`*	Specifies the color to be used for highlighting the clock tree path that is being traced. *Default*: red

`-file` *`fileName`*	Specifies the name of the file in which the physical information for each instance and net in the clock path being traced will be dumped.
	The following information is saved in the file:
	`Name Cell Status Location Wire Length`
	`CLK_ROOT PAD Fixed (20,40)`
	`net_1 don't_touch 12.5`
	`Buf_1 BUFX1 placed (100,180)`
	`net_2 35`
	`Buf_2 BUFX2 placed (200, 120)`
	Name is the instance name or the net name
	Cell is the instance cell type. This information is only for instances
	Status is the place status for an instance and constrain status for a net. For dont_touch nets, the status is '`dont_touch`', otherwise this column is left blank
	Location is the physical location of the instance or the coordinate of that instance
	Wire Length is only for nets

`-from` *`clockroot`*	Specifies the instance name as the starting point of the highlight. If this parameter is not specified, the starting point of the highlight is the clock root of the specified sink.
`-index` *`colorindex`*	Specifies the range of colors that can be used to highlight the clock tree path. Minimum is 1 and maximum is 32. The range corresponds to the colors in the color picker provided in the *Highlight Clock Path* option in the context menu of the Clock Tree Viewer. The number 1 means red, 2 means blue, and so on. An example is shown in the image below. *Default:* 1 or red.
`-through` *`instancename`*	Specifies the instance or pin through which the path should be traced.
`-to` *`sink`*	Specifies the end point of the highlighted path.

The image below shows the clock tree path highlighted in green, which corresponds to the color index 3. It also shows the color picker with the range of colors included in the color index.

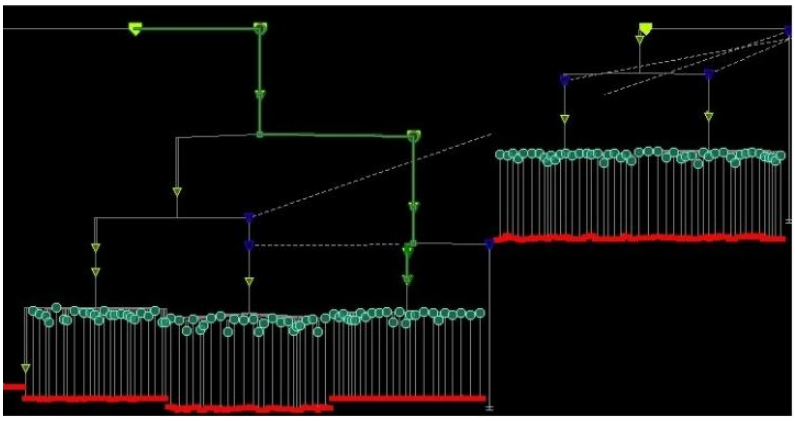


Example

The following command highlights the clock tree path for the specified pin, `ff1`, from the clock root in green color:

- `ctd_trace -to ff1 -index 3`

  The CTD shows the following:

- The following command highlights the path between two sinks that are on the same path, in green color:
  `ctd_trace -to ff1 -from u1 -index 3`

- `create_ccopt_clock_tree_spec`
- `ctd_win`
- `close_ctd_win`
- `get_ctd_win_id`
- `get_ctd_win_title`
- `gui_zoom_ctd`
- `set_ctd_win_title`
- The following topic in the *Innovus Menu Reference*
  - Context Menu of Clock Tree Debugger

ctd_win

```
ctd_win
[-help]
[-id windowIDName]
[-include_reporting_only_skew_groups]
[-title CTDWindowID]
[-unit_delay]
```

Opens a Clock Tree Debugger (CTD) window with the user-defined window ID and title.

When run without specifying the ID and title, the command opens a CTD window with a system default window title. By default, the window title is the name of the current analysis corner, which shows in the CTD window. For example, "Clock Tree Debugger - func_rcbest".

By default, all CTD windows have their unique window ID. The mechanism of the default window ID is `ctdMain_0, ctdMain_1, ctdMain_2, ctdMain_3`....and so on. So, by default, the window ID of a new opened Clock Tree Debugger window is `ctdMain_0`.

The information in the title comprises the following:

```
Session title: Window type: Window title
```

where,

Window type is always “Clock Tree Debugger”.

If the user-specified session title is “`my_test.tcl`”, and the default primary analysis corner is “`primary_corner`”, then with `ctd_win`, the total set of the window title line will be:

```
my_test.tcl : Clock Tree Debugger : primary_corner
```

Parameters

`-help`	Outputs a brief description that includes type and default information for each `ctd_win` parameter. For a detailed description of the command and all of its parameters, use the man command: man `ctd_win`.
`-id windowIDName`	Opens a Clock Tree Debugger window with a user-specified window ID. By default, the window IDs will be `ctdMain_0`, or `ctdMain_1`, and so on.
`-include_reporting_only_skew_groups`	When this parameter is specified, the GUI displays the reporting-only skew groups. A reporting-only skew group is a skew group whose `constrains` property is set to `none`. Such a skew group imposes no clock balancing constraint and is not considered by CTS. By default, this setting if off, which means the reporting-only skew groups are omitted from the CTD. **Note**: Once the CTD is started, you cannot add or remove the reporting-only skew groups from those that are displayed. Start a new CTD window to specify the skew group filtering.

`-title` *`CTDWindowID`*	Specifies the user-defined title for the CTD window. Open a Clock Tree Debugger window with a user specified title. For example, if you specify `my_title` as the window title, when session title is `my_test.tcl` and the primary analysis corner is `primary_corner`, then the total set of the window title line will be: `my_test.tcl : Clock Tree Debugger : my_title` **Note**: The window's ID if not specified using the `-id` parameter, will be system default ID. To view the default window ID, use the `get_ctd_win_id` command.

`-unit_delay`

Opens the CTD in the unit delay mode. The unit delay lets you view the depth of clock tree objects easily. This is useful when you have large designs with deep gate-level trees. When debugging clock trees, you can use this view to check how the clock trees are balanced by looking at the depth of the clock trees. Although, the unit delay mode can also be enabled using the *Unit delay* submenu in the *Visibility* menu of the CTD but this is only valid after running clock tree synthesis, and you still need to invoke timing calculation and extraction, which are time consuming. You can use this parameter to open the CTD in unit delay mode even if the design is not placed or without performing CTS.

When the CTD is opened in this mode, the following options in CTD menus are disabled:

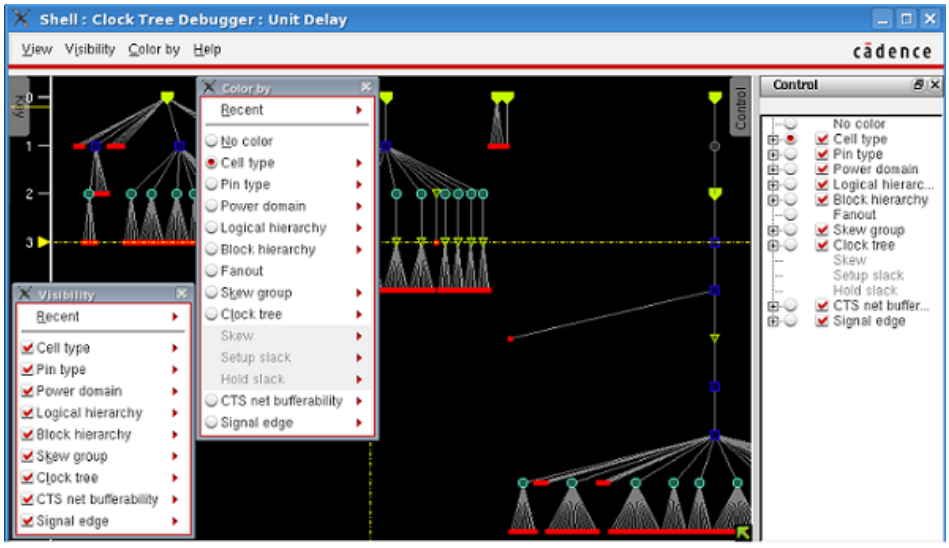
Visibility menu:

- Timing windows
- Delays
- Unit delay

Color by menu and the *Control* panel:

- Transition time
- Total net cap
- Max cap violation
- Skew
- Setup slack
- Hold slack
- Timing windows

This is shown in below image.



Examples

- The following command creates a CTD window ID with the default name, `ctdMain_0`:

  ```
  ctd_win
  ```

  When you use the `get_ctd_win_id` command to list the window ID, you get the above window ID:

  ```
  get_ctd_win_id
  ctdMain_0
  ```

- The following command creates a CTD window ID with the user-specified name, `my_test`:

  ```
  ctd_win -id my_test
  ```

  Now, when you use the `get_ctd_win_id` command to list all window IDs, you get the above window IDs in the list:

  ```
  get_ctd_win_id -all
  ctdMain_0 my_test
  ```

  If you use the `ctd_win` command with an existing window ID, it will pop up the corresponding CTD windows instead of creating a new one. This command will open the existing window, `my_test`.

  ```
  ctd_win -id my_test
  ```

- The following command creates a CTD window ID, `my_test` and CTD window title of `myTest.tcl`:

  ```
  ctd_win -id my_test -title myTest.tcl
  ```

  When you use the `-detail` parameter of the `get_ctd_win_id` command, the following information is returned:

  ```
  get_ctd_win_id -detail
  my_test "Clock Tree Debugger:myTest.tcl: func_rcbest"
  ```

  where, `my_test` is the specified window ID, window type is Clock Tree Debugger, window title is `myTest.tcl`, and `func_rcbest` is the name of the current analysis corner.

delete_ccopt_clock_spines

```
delete_ccopt_clock_spines
[-help]
pattern
[-regexp]
```

This command deletes all clock spines matching the specified pattern. This will also delete any placement groups or regions associated with the spine.

> ⚠ This command is part of CCOpt spine functionality, which is a limited-access feature in this release. It is enabled by a variable specified through the `setLimitedAccessFeature` command. To use this feature, contact your Cadence representative to explain your usage requirements, and make sure this feature meets your needs before deploying it widely.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_ccopt_clock_spines` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_ccopt_clock_spines`.
`pattern`	Specifies the patterns for clock spines to delete. This parameter is required.
`-regexp`	Specifies whether or not to use regular expression matching.

Example

- The following set of commands are used to delete and retrieve information for clock spines spineA and spineB that are created using the `create_ccopt_clock_spine` command:
  The following command deletes `spineA`:
  ```
  delete_ccopt_clock_spines spineA
  ```

  Now when you retrieve the list of spines, the software returns the following information:

  ```
  get_ccopt_clock_spines spine*
  spineB
  ```

Related Commands

- `create_ccopt_clock_tree`
- `create_ccopt_clock_spine`
- `get_ccopt_clock_spines`
- `get_ccopt_property`

delete_ccopt_clock_tree_source_group

```
delete_ccopt_clock_tree_source_group
[-help]
pattern
[-regexp]
```

This command deletes all clock tree source groups matching the specified pattern.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_ccopt_clock_tree_source_group` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_ccopt_clock_tree_source_group`.
`pattern`	Specifies the patterns for clock tree source groups to delete. This parameter is required.
`-regexp`	Specifies whether or not to use regular expression matching.

Examples

- Use the following command to delete all clock tree source groups starting with `"clk"`:

  ```
  delete_ccopt_clock_tree_source_group clk*
  ```

- When you check for clock tree source groups starting with `"clk"`, the software returns nothing.

  ```
  get_ccopt_clock_tree_source_groups clk*
  nothing returned
  ```

Related Commands

- create_ccopt_clock_tree_source_group
- create_ccopt_clock_tree_spec
- create_ccopt_clock_tree
- ccopt_design
- clock_opt_design
- get_ccopt_clock_tree_source_groups

delete_ccopt_clock_tree_spec

```
delete_ccopt_clock_tree_spec
[-help]
[-preserve_sink_insertion_delays]
```

This command deletes all the skew group definitions and other clock tree synthesis configuration information. This command fully resets any configuration except for any global CCOpt mode settings. However, you can preserve the pin insertion delays on clock tree sinks by specifying the `-preserve_sink_insertion_delays` parameter.

Parameter

`-help`	Outputs a brief description of the `delete_ccopt_clock_tree_spec` parameter.
`-preserve_sink_insertion_delays`	When specified, preserves pin insertion delays currently configured on clock tree sinks.

Example

- Use the following command to get a list of clock trees:

  ```
  get_ccopt_clock_trees *
  m_clk m_digit_clk m_dsram_clk m_ram_clk m_rcc_clk m_spi_clk refclk<1> refclk
  ```

- Use the following command to get a list of skew groups:

  ```
  get_ccopt_skew_groups *
  m_clk/PM_HL_FUNC m_digit_clk/PM_HL_FUNC m_dsram_clk/PM_HL_FUNC m_ram_clk/PM_HL_FUNC m_rcc_clk/PM_HL_FUNC
  m_spi_clk/PM_HL_FUNC refclk/PM_HL_FUNC
  ```

- Use the following command to delete all CTS configuration:

  ```
  delete_ccopt_clock_tree_spec
  ```

- When you check for clock trees and skew groups after deleting the CTS configuration, the software returns nothing.

  ```
  get_ccopt_clock_trees *
  nothing returned
  get_ccopt_skew_groups *
  nothing returned
  ```

Related Commands

- ccopt_design
- clock_opt_design

- create_ccopt_clock_tree_spec
- reset_ccopt_config

delete_ccopt_clock_trees

```
delete_ccopt_clock_trees
[-help]
pattern
[-regexp]
```

This command deletes all clock trees matching the specified pattern. It makes no changes to the design.

Note: It is recommended to use the `delete_ccopt_clock_tree_spec` command to reset the entire CTS configuration. It removes clock tree definition from the in-memory clock tree specification.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_ccopt_clock_trees` parameter. For a detailed description of the command and all of its parameters, use the man command: man `delete_ccopt_clock_trees`.
`pattern`	Specifies the patterns for clock trees to delete. This parameter is required.
`-regexp`	Specifies whether or not to use regular expression matching.

Example

- The following command deletes all clock trees whose names start with "ref":
  ```
  delete_ccopt_clock_trees ref*
  ```

  The software gives the following message:
  ```
  Un-defining clock tree refclk.
  ```

delete_ccopt_flexible_htrees

```
delete_ccopt_flexible_htrees
[-help]
pattern
[-regexp]
```

This command deletes all flexible H-trees matching the specified pattern.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_ccopt_flexible_htrees` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_ccopt_flexible_htrees`.
`pattern`	Specifies the patterns for flexible H-trees to delete. This parameter is required.
`-regexp`	Specifies whether or not to use regular expression matching.

Example

- The following command deletes all flexible trees whose names start with "`htree`":

  ```
  delete_ccopt_flexible_htrees htree*
  ```

delete_ccopt_preferred_cell_stripe

```
delete_ccopt_preferred_cell_stripe
[-help]
pattern
[-regexp]
```

Deletes all preferred cell stripes whose names match the specified pattern. Use this command to delete any incorrectly created preferred cell stripes objects so that they may be recreated using the `create_ccopt_preferred_cell_stripe` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_ccopt_preferred_cell_stripe` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_ccopt_preferred_cell_stripe`.
`pattern`	Specifies the patterns for preferred cell stripes to delete. This parameter is required.
`-regexp`	Specifies whether or not to use regular expression matching.

Example

- Use the following command to delete all preferred cell stripes starting with "stripe":
  ```
  delete_ccopt_preferred_cell_stripes stripe*
  ```

Related Commands

- `ccopt_design`
- `clock_opt_design`
- `create_ccopt_preferred_cell_stripe`

delete_ccopt_skew_groups

```
delete_ccopt_skew_groups
[-help]
[-constrains cts | ccopt_initial | ccopt]
pattern
[-regexp]
```

This command deletes all skew groups matching the specified pattern. It makes no changes to the design.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_ccopt_skew_groups` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_ccopt_skew_groups`.
`-constrains cts | ccopt_initial | ccopt`	
	Specifies whether `cts`, `ccopt_initial`, or `ccopt` skew groups are to be deleted.
`pattern`	Specifies the patterns for skew groups to delete. This parameter is required.
`-regexp`	Specifies whether or not to use regular expression matching.

Examples

- The following command deletes all skew groups associated with the clock, `m_digit_clk`:
  ```
  delete_ccopt_skew_groups m_digit_clk*
  ```

- The following command deletes all skew groups whose name contains the word "`ram`":
  ```
  delete_ccopt_skew_groups ram -regexp
  ```

- The following topic in the *Innovus User Guide*
  - Clock Trees and Skew Groups

delete_clock_tree_repeaters

```
delete_clock_tree_repeaters

[-help]
[-force]
```

This command removes buffers and inverter pairs from the clock trees. If used without specifying any parameters, it deletes all repeaters except those that have fixed or dont_touch attributes that are assigned either by the user or by `ccopt_design`. To delete all repeaters, specify the `-force` parameter.

Note: After running the command, there may be remaining inverters in the clock tree that are required to preserve an inversion. The remaining inverters may not be the same as the ones that were originally introduced for inversion, which means that the naming can differ.

Parameter

`-help`	Prints a brief description that includes type and default information for each `delete_clock_tree_repeaters` parameter. For a detailed description of the command and its parameter, use the man command: `man delete_clock_tree_repeaters`.
`-force`	Deletes all repeaters even if they have fixed or dont_touch attributes defined.

Related Command

- `ccopt_design`
- `clock_opt_design`

delete_route_type

```
delete_route_type
[-help]
-name string
```

This command deletes the specified route type object created using the `create_route_type` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_route_type` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_route_type`.
`-name string`	Specifies the name of the route type object to be deleted. This parameter is required.

Examples

- The following command creates a route type for a non-default rule:
  ```
  create_route_type -name RType1 -non_default_rule NDR1
  ```
- The following command deletes the route type that was previously created for the NDR::
  ```
  delete_route_type -name RType1
  ```

get_ccopt_clock_spines

```
get_ccopt_clock_spines
[-help]
pattern
[-regexp]
```

This command returns a list of clock spines whose names match the specified pattern.

⚠ This command is part of CCOpt spine functionality, which is a limited-access feature in this release. It is enabled by a variable specified through the `setLimitedAccessFeature` command. To use this feature, contact your Cadence representative to explain your usage requirements, and make sure this feature meets your needs before deploying it widely.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_clock_spines` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_clock_spines`.
pattern	Returns a list of clock spines that match this pattern. It is a required parameter.
`-regexp`	When specified, treats all patterns as full Tcl regular expressions. If not specified, pattern is treated as a wildcard pattern.

Example

- The following command returns the list of all clock spines that have "spine" in their names:

  ```
  get_ccopt_clock_spines spine*
  spineA spineB
  ```

Related Commands

- `create_ccopt_clock_tree`
- `create_ccopt_clock_spine`
- `delete_ccopt_clock_spines`
- `get_ccopt_property`

get_ccopt_clock_tree_capacitance

```
  get_ccopt_clock_tree_capacitance
[-help]
pin | port
[-delay_corner corner]
[-delay_type {early | late}]
[-edge {rise | fall | both}]
[-load | -wire]
```

This command retrieves the capacitance on the specified pin. When you run the command without specifying the type of capacitance to be retrieved, load or wire, then the command retrieves the total capacitance on a pin, which includes both the wire capacitance of nets connected to the pin, and the load capacitance of pins connected to those nets. Because the capacitance varies depending on the timing data used to calculate delays, this command provides options such as rise, fall, early, and late that let you specify the exact timing criteria to use when calculating capacitances.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_clock_tree_capacitance` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_clock_tree_capacitance`.
`-delay_corner` *corner*	Specifies the delay corner of the specified pin for which capacitance information is provided. By default, if delay corner is not specified, CCOpt uses the CTS primary corner as configured by the `set_ccopt_property primary_delay_corner <corner>` command. If this is not set, it will use the default setup analysis view as configured by the `set_default_view -setup <view>` command.
`-delay_type {early | late}]`	Specifies whether to use early or late half delays. When `early` is specified, CCOpt uses only early path timing data to calculate capacitances, for the clock edge specified. When `late` is specified, CCOPT uses only late path timing data to calculate capacitances, for the clock edge specified. By default, if neither early or late are specified, CCOpt will use late half delays to calculate capacitances.
`-edge {rise | fall | both}`	
	Specifies the edge of the specified pin for which capacitance is to be calculated. When `fall` is specified, CCOpt uses only `falling` clock edge timing data to calculate capacitances. When `rise` is specified, CCOpt uses only `rising` clock edge timing data to calculate capacitances. By default, if neither `rise` or `fall` are specified or if both is specified, CCOpt uses both rising and falling clock edge timing data to calculate capacitances.
`-load | -wire`	When `-load` is specified, the command returns the driven load capacitance value of the specified pin. When `-wire` is specified, the command returns the driven wire capacitance value of the specified pin. The two options are mutually exclusive.
pin | *port*	Specifies the pin or port for which the load capacitance value is to be returned.This is a required parameter.

Examples

- Use the following command to return the list of clock tree cells:
  ```
  get_ccopt_clock_tree_cells 770 -regexp
  RESULTS_CONV_INST/upper770/g54 ...
  ```
- Use the following command to return the pins for the specified object:
  ```
  get_property [get_pins -of_object RESULTS_CONV_INST/upper770/g54] hierarchical_name
  RESULTS_CONV_INST/upper770/g54/ZN RESULTS_CONV_INST/upper770/g54/I
  ```
- Use the following command to return the capacitance information for the specified pin:
  ```
  get_ccopt_clock_tree_capacitance RESULTS_CONV_INST/upper770/g54/ZN
  ```
  The software returns the following:
  ```
  0.0160777831078
  ```
- Use the following command to return the wire capacitance information for the specified pin:
  ```
  get_ccopt_clock_tree_capacitance TEST_CONTROL_INST/g145/ZN -wire
  ```
  The software returns the following:
  ```
  0.00874637126923
  ```

Related Commands

- get_ccopt_clock_tree_cells
- get_pins
- set_ccopt_property
- set_default_view

get_ccopt_clock_tree_cells

```
get_ccopt_clock_tree_cells
[-help]
pattern
[-in_clock_trees list_of_trees]
[-net_types leaf | trunk | top]
[-node_types buffer | inverter | clock_gate | logic | source | generator | all]
[-not_in_clock_trees list_of_trees]
[-regexp]
```

This command returns a list of clock tree cells - cell instances that form a part of the clock tree network - whose names match the specified pattern. By default, the command returns all clock tree cells with matching names, but you can use optional parameters to filter the list based on cell type and clock tree membership.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_clock_tree_cells` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_clock_tree_cells`.
`-in_clock_trees` *`list_of_trees`*	
	Specifies a Tcl list of clock trees whose cells are to be included in the list. If not specified, all the cells of all the clock trees in the design that satisfy the other conditions of the command will be returned.
`-net_types leaf | trunk | top`	
	Only returns nodes driving nets of the specified type(s). All clock tree nets fall into one of three categories: • leaf nets - nets connected to sinks • top nets - nets with a high transitive fanout, exceeding the threshold specified using the `set_ccopt_property routing_top_min_fanout` CCOpt property • trunk nets - all other nets in the clock tree that are neither leaf nor top nets By default, all net types are returned: `leaf, top, and trunk`.
`-node_types buffer | inverter | clock_gate | logic | source | generator | all`	
	Specifies the type of cells returned by the command. If not specified, all types of cells that satisfy the other conditions of the command will be returned. Valid values for *`type`* are: "buffer", "clock_gate", "inverter", "logic", "source", "generator", and "all".
`-not_in_clock_trees` *`list_of_trees`*	
	Specifies a Tcl list of clock tree whose cells are to be excluded from the list. If not specified, all the cells that satisfy the other conditions of the command will be returned.
`pattern`	Returns clock tree cells that match this pattern. If not specified, all the clock tree cells that satisfy the other conditions of the command will be returned. **Note**: The wildcard pattern, (*) matches zero or more characters. You can also use the question mark (?), which matches exactly one character.
`-regexp`	When specified, treats all patterns as full Tcl regular expressions. If not specified, pattern is treated as a wildcard pattern.

Examples

- The following command returns the list of all clock tree cells that start with "TEST", which is a wildcard match:

```
get_ccopt_clock_tree_cells TEST*
TEST_CONTROL_INST/g138 TEST_CONTROL_INST/g140 TEST_CONTROL_INST/g142 TEST_CONTROL_INST/g139
TEST_CONTROL_INST/g141 TEST_CONTROL_INST/g137
```

- The following command returns the list of all clock tree cells that contain the word "TEST", which is a Tcl pattern match:

```
get_ccopt_clock_tree_cells TEST -regexp
TEST_CONTROL_INST/g138 TEST_CONTROL_INST/g140 TEST_CONTROL_INST/g142 TEST_CONTROL_INST/g139
RAM_256x16_TEST_INST/CPF_LS_160_m_dsram_clk TEST_CONTROL_INST/g141 TEST_CONTROL_INST/g137
```

- The following command returns the list of all clock tree cells in either of the clock trees, `M_CLK or M_DIGIT_CLK:`

```
get_ccopt_clock_tree_cells * -in_clock_trees {m_clk m_digit_clk}
TEST_CONTROL_INST/g141 TEST_CONTROL_INST/g137 RESULTS_CONV_INST/CPF_LS_159_m_clk DMA_INST/CPF_LS_158_m_clk
SPI_INST/RC_CG_HIER_INST17/RC_CGIC_INST RESULTS_CONV_INST/RC_CG_HIER_INST7/RC_CGIC_INST
RESULTS_CONV_INST/RC_CG_HIER_INST6/RC_CGIC_INST RESULTS_CONV_INST/RC_CG_HIER_INST3/RC_CGIC_INST
RESULTS_CONV_INST/RC_CG_HIER_INST2/RC_CGIC_INST RESULTS_CONV_INST/RC_CG_HIER_INST1/RC_CGIC_INST
DMA_INST/RC_CG_HIER_INST0/RC_CGIC_INST
```

- The following command returns the list of all clock trees except for cells in either of the clock trees, `M_CLK or M_DIGIT_CLK:`

```
get_ccopt_clock_tree_cells * -not_in_clock_trees {m_clk m_digit_clk}
TEST_CONTROL_INST/g138 SPI_INST/RC_CG_HIER_INST16/RC_CGIC_INST TEST_CO...
```

- The following command gets all inverters in any clock tree:

```
get_ccopt_clock_tree_cells *  -node_types inverter

```

- The following command gets all inverters in `M_RCC_CLK clock tree:`

```
get_ccopt_clock_tree_cells *  -node_types inverter -in_clock_trees m_rcc_clk
RESULTS_CONV_INST/g18694
```

Related Information

- `create_ccopt_clock_tree`
- `delete_ccopt_clock_trees`
- `set_ccopt_property`
- The following topic in the *Innovus User Guide*
  - Generating Reports in Clock Tree Synthesis

get_ccopt_clock_tree_nets

```
get_ccopt_clock_tree_nets
[-help]
pattern
[-in_clock_trees list_of_trees]
[-net_types leaf | trunk | top]
[-not_in_clock_trees list_of_trees]
[-regexp]
```

This command returns a list of clock tree nets whose names match the specified pattern. By default, the command returns all clock tree nets with matching names, but you can use optional parameters to filter the list based on net type and clock tree membership. Valid values for net types are `leaf, trunk,` and `top`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_clock_tree_nets` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_clock_tree_nets`.
`-in_clock_trees` *`list_of_trees`*	Specifies a TCL list of clock trees whose nets are to be included in the list. If not specified, all the nets of all the clock trees in the design that satisfy the other conditions of the command will be returned.
`-net_types leaf | trunk | top`	
	Only returns nets of the specified type(s). All clock tree nets fall into one of three categories: • leaf nets - nets connected to sinks • top nets - nets with a high transitive fanout, exceeding the threshold specified using the `set_ccopt_property routing_top_min_fanout` CCOpt property • trunk nets - all other nets in the clock tree that are neither leaf nor top nets By default, all net types are returned: `leaf, top, and trunk`.
`-not_in_clock_trees` *`list_of_trees`*	
	Specifies a TCL list of clock trees whose nets are to be excluded from the list. If not specified, all the nets that satisfy the other conditions of the command will be returned.
`pattern`	Returns clock tree nets that match this pattern. If not specified, all the nets that satisfy the other conditions of the command will be returned.
`-regexp`	When specified, treats all patterns as full TCL regular expressions. If not specified, pattern is treated as a wildcard pattern.

Examples

- The following command returns the list of all clock tree nets in all clock trees:
  ```
  get_ccopt_clock_tree_nets *
  refclk clk TEST_CONTROL_INST/clk_CPF_LS_DUP_101 TEST_CONTROL_INST/n_0 TEST_CONTROL_INST/n_1 m_tdsp_clk
  TDSP_CORE_INST/clk_CPF_LS_DUP_162 TDSP_CORE_INST/TDSP_CORE_MACH_INST
  ```

- The following command returns the list of all trunk type nets in all clock trees:
  ```
  get_ccopt_clock_tree_nets * -net_types trunk
  refclk clk TEST_CONTROL_INST/clk_CPF_LS_DUP_101 TEST_CONTROL_INST/n_1 m_tdsp_clk m_spi_clk m_rcc_clk
  RESULTS_CONV_INST/rcc_clk_CPF_LS_DUP_161 RESULTS_CONV_INST/upper770/n_4 RESULTS_CONV_INST/upper1336/n_4
  RESULTS_CONV_INST/lower770/n_4 RESULTS_CONV_INST/lower1336/n_4 RESULTS_CONV_INST/n_1390
  RESULTS_CONV_INST/n_1389 RESULTS_CONV_INST/n_1394 RESULTS_CONV_INST/n_1393 RESULTS_CONV_INST/n_1392
  RESULTS_CONV_INST/n_1391 m_dsram_clk
  ```

- The following command returns the list of all nets whose names start with the word "TEST":
  ```
  get_ccopt_clock_tree_nets TEST*
  TEST_CONTROL_INST/clk_CPF_LS_DUP_101 TEST_CONTROL_INST/n_0 TEST_CONTROL_INST/n_1
  ```

- The following command returns the list of all nets that contain the word "TEST":
  ```
  get_ccopt_clock_tree_nets TEST -regexp
  TEST_CONTROL_INST/clk_CPF_LS_DUP_101 TEST_CONTROL_INST/n_0 TEST_CONTROL_INST/n_1
  RAM_256x16_TEST_INST/wr_CPF_LS_DUP_160
  ```

Related Information

get_ccopt_clock_tree_sinks

```
get_ccopt_clock_tree_sinks
[-help]
pattern
[-in_clock_trees list_of_trees]
[-not_in_clock_trees list_of_trees]
[-regexp]
```

This command returns a list of clock tree sinks whose names match the specified pattern. By default, the command returns all clock tree sinks with matching names, but you can use optional parameters to filter the list based on the clock tree membership.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_clock_tree_sinks` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_clock_tree_sinks`.
`-in_clock_trees list_of_trees`	
	Specifies a TCL list of clock trees whose sinks are to be included in the list. If not specified, all the sinks of all the clock trees in the design that satisfy the other conditions of the command will be returned.
`-not_in_clock_trees list_of_trees`	
	Specifies a TCL list of clock trees whose sinks are to be excluded from the list. If not specified, all the sinks that satisfy the other conditions of the command will be returned.
pattern	Returns clock tree sinks that match this pattern. If not specified, all the sinks that satisfy the other conditions of the command will be returned.
`-regexp`	When specified, treats all patterns as full TCL regular expressions. If not specified, pattern is treated as a wildcard pattern.

Examples

- The following command returns the list of all clock tree sinks in all clock trees:

```
get_ccopt_clock_tree_sinks *
{TDSP_CORE_INST/TDSP_CORE_MACH_INST/tdsp_state_reg[2]/CP}
{TDSP_CORE_INST/TDSP_CORE_MACH_INST/tdsp_state_reg[1]/CP}
{TDSP_CORE_INST/TDSP_CORE_MACH_INST/tdsp_state_reg[0]/CP}...
```

- The following command returns the list of all clock tree sinks in clock whose name starts with "TEST":

```
get_ccopt_clock_tree_sinks TEST*
TEST_CONTROL_INST/g137/A1
```

- The following command returns the list of all clock tree sinks in clock trees whose names contain "TEST":

```
get_ccopt_clock_tree_sinks TEST -regexp
TEST_CONTROL_INST/g137/A1 RAM_128x16_TEST_INST/RAM_128x16_INST/CLK RAM_256x16_TEST_INST/RAM_256x16_INST/CLK
```

Related Information

- `set_ccopt_property`
- The following topic in the *Innovus User Guide*
  - Generating Reports in Clock Tree Synthesis

get_ccopt_clock_tree_slew

```
get_ccopt_clock_tree_slew
[-help]
pin
[-delay_corner corner]
[-delay_type {early | late}]
[-edge {rise | fall | both}]
```

This command returns the slew information for the user-specified pin. The command is usually used to collect slew data on a clock tree, for example, to create custom histograms.

Note: A clock tree specification is required before running `get_ccopt_clock_tree_slew`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_clock_tree_slew` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_clock_tree_slew`.
`-delay_corner` *corner*	
	Specifies the delay corner of the specified pin to be queried for slew information. By default, if delay corner is not specified, CCOpt uses the CTS primary corner as configured by the `set_ccopt_property primary_delay_corner` *corner* command. If this is not set, it will use the default setup analysis view as configured by the `set_default_view -setup` *view* command.
`-delay_type {early | late}]`	
	Specifies whether to use early or late half delays. When `early` is specified, CCOpt uses only early path timing data to calculate slew, for the clock edge specified. When `late` is specified, CCOpt uses only late path timing data to calculate slew, for the clock edge specified. By default, if neither early or late are specified, CCOpt will use late half delays to calculate slew information.
`-edge { rise | fall | both }`	
	Specifies the edge of the specified pin for which slew information is to be calculated. When `fall` is specified, CCOpt uses only `falling` clock edge timing data to calculate slew. When `rise` is specified, CCOpt uses only `rising` clock edge timing data to calculate slew. By default, if neither rise or fall are specified, CCOpt uses both rising and falling clock edge timing data to calculate slew.
pin	Specifies the pin for which the slew information is provided. This is a required parameter.

Examples

- Use the following command to get a list of clock tree cells:
  ```
  get_ccopt_clock_tree_cells *
  PLLCLK_INST TEST_CONTROL_INST/CPF_LS_101_clk TEST_CONTROL_INST/g145 TEST_CONTROL_INST/g144
  TEST_CONTROL_INST/g136...
  ```

- Use the following command to get the list of pins in the specified clock tree:
  ```
  get_pins TEST_CONTROL_INST/g145/*
  TEST_CONTROL_INST/g145/ZN TEST_CONTROL_INST/g145/A2 TEST_CONTROL_INST/g145/A1
  0x5d5
  ```
- Use the following command to get the slew value for the specified pin:
  ```
  get_ccopt_clock_tree_slew Inst1/A
  ```
  The software returns the following value for the slew for the pin A:
  ```
  0.2228
  ```
  Note: To confirm that the instance is part of the clock network, use `get_ccopt_clock_tree_cells <inst>`
- Use the following command to get the slew value for the specified pin in the specified clock tree:
  ```
  get_ccopt_clock_tree_slew TEST_CONTROL_INST/g145/ZN
  ```
  The software returns the following value for the slew for the pin ZN:
  ```
  0.2228
  ```

get_ccopt_clock_tree_source_groups

```
get_ccopt_clock_tree_source_groups
[-help]
pattern
[-regexp]
```

This command returns a list of clock tree source group objects matching the supplied pattern.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_clock_tree_source_groups` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_clock_tree_source_groups`.
`pattern`	Specifies the patterns for clock tree source groups to return.
`-regexp`	Specifies whether or not to use regular expression matching.

Examples

- The following command returns the list of all clock tree source groups:

  ```
  get_ccopt_clock_tree_source_groups *
  top_clk_group test_sig_group
  ```

- The following command returns the list of all clock tree source groups that contain the word `clk`, which is a Tcl pattern match：

  ```
  get_ccopt_clock_tree_source_groups clk -regexp
  top_clk_group
  ```

- The following command returns the list of all clock tree source groups that start with `"t"`, which is a wildcard match：

  ```
  get_ccopt_clock_tree_source_groups t*
  top_clk_group test_sig_group
  ```

get_ccopt_clock_trees

```
get_ccopt_clock_trees
[-help]
pattern
[-regexp]
```

This command returns the names of the clock trees whose names match the specified pattern.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_clock_trees` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_clock_trees`.
`pattern`	Returns a list of clock trees that match this pattern. The wildcard pattern, (*) matches zero or more characters. You can also use the question mark (?), which matches exactly one character.
`-regexp`	When specified, treats all patterns as full Tcl regular expressions. If not specified, pattern is treated as a wildcard pattern.

Examples

- The following command returns the list of all clock trees:

  ```
  get_ccopt_clock_trees *
  m_clk m_digit_clk m_dsram_clk m_ram_clk m_rcc_clk m_spi_clk refclk<1> refclkv
  ```

- The following command returns the list of all clock trees that contain the word `ram_clk`, which is a Tcl pattern match：

  ```
  get_ccopt_clock_trees ram_clk -regexp
  m_dsram_clk m_ram_clk
  ```

- The following command returns the list of all clock trees that start with `"m"`, which is a wildcard match：

  ```
  get_ccopt_clock_trees m*
  m_clk m_digit_clk m_dsram_clk m_ram_clk m_rcc_clk m_spi_clk
  ```

Related Information

get_ccopt_dag_traversal

```
get_ccopt_dag_traversal
[-help]
[-fanin]
[-fanout]
[-of_insts instances]
[-of_pins pins]
[-skew_group skew_group_name]
[-skip buffers inverters drivers clock_gates logics generators generated_roots all]
[-transitive]
```

This command traverses the clock tree network DAG, starting at the specified pins and traversing to their fanin or fanout, returning a list of the resulting pins. Instance types can be skipped over, and can be restricted to a specified skew group. The clock tree network is modeled as a DAG (Directed Acyclic Graph) to accommodate re-convergence and overlap among clock trees and skew groups.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_dag_traversal` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_dag_traversal`.
`-fanin`	Returns the output clock network pins of the fanin of the specified pins.
`-fanout`	Returns the input clock network pins of the fanout of the specified pins.
`-of_pins`	Specifies a list of pins to start traversing from.
`-of_insts`	Specifies a list of instances to start traversing from. If -fanin is specifed, will start from the input pins of the instances. If -fanout is specifed, will start from the output pins.
`-skew_group skew_group_name`	If specified, restricts traversal to instances in the skew group.
`-skip` *types*	Specifies the types of nodes that should be skipped past to their fanin/fanout during the traversal. You can specify one or more of the following: • buffers • inverters • drivers (equivalent to buffers and inverters) • clock_gates • logics • generators • generated_roots • all (equivalent to listing all the above, and also equivalent to `-transitive`)
`-transitive`	Skip all types and get sinks (if -fanout) or clock roots (if -fanin). This is equivalent to the `-skip all` option.

Examples

```
get_ccopt_dag_traversal -fanout -of_insts CTS_ccd_BUF_clock_G0_L1_1

get_ccopt_dag_traversal -fanout -skip buffers -of_insts CTS_ccd_BUF_clock_G0_L1_1

get_ccopt_dag_traversal -fanin -skip {buffers generators logics} -of_pins {CTS_ccd_BUF_clock_G0_L1_1/A
CTS_cdb_BUF_clock_G0_L1_2/A}

set pins [get_ccopt_dag_traversal -transitive -skew_group skewgroup1 -fanin -of_pins d1111a/CK]

foreach pin $pins  {

  Puts "Got pin $pin"
}
```

get_ccopt_delay_corner

```
get_ccopt_delay_corner
[-help]
```

This command returns the name of the CCOpt primary-half delay corner, which is the main corner that CTS uses for balancing clock trees. This delay corner is usually the first setup corner. This command is useful if you are trying to determine why the balancing constraints have not been met.

The primary delay corner can be set using the `primary_delay_corner` property. However, if you set this property to {}, which is the default value, then you can use the `get_ccopt_delay_corner` command to retrieve the name of the corner that was picked by default.

Parameter

`-help`	Outputs a brief description of `get_ccopt_delay_corner` parameter.

Example

- The following command returns the name of the CCOpt primary-half corner:

  ```
  get_ccopt_delay_corner
  AV_HL_FUNC_MAX_RC1_dc:setup
  ```

Related Information

- `set_ccopt_property`
- The following topic in the *Innovus User Guide*
  - Generating Reports in Clock Tree Synthesis
- The following property:
  `primary_delay_corner`
  For details, see the CCOpt Properties chapter in the *Innovus User Guide.*

get_ccopt_effective_max_capacitance

```
get_ccopt_effective_max_capacitance
[-help]
pin | port
[-delay_corner corner]
[-delay_type {early | late}]
[-source]
[-value]
```

Returns the value of the frequency-dependent effective maximum capacitance constraint that the software will apply at a given pin in the clock tree. By default, the software returns the following information:

- The actual value of the maximum effective capacitance or constrained maximum capacitance at the specified pin
- The source of the constraint

To annotate a clock period at a point in the clock tree, a new property called `clock_period` is provided. To aid debugging of clock period propagation, the effective or the computed clock period will be accessible for any given pin in the clock tree by querying the read only property, `effective_clock_period`. This property lists the set of pins that define the fastest `effective_clock_period` at a given pin. Details of these properties are provided below.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_effective_max_capacitance` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_effective_max_capacitance`.
`-delay_corner` *corner*	Specifies the delay corner of the specified pin for which effective maximum capacitance information is provided. By default, if delay corner is not specified, CCOPT uses the CTS primary corner as configured by the `primary_delay_corner` *delay_corner_name* property of the `set_ccopt_property` command. If this is not set, it will use the default setup analysis view as configured by the command, `set_default_view -setup` *newDefaultSetupView*.
`-delay_type {early | late}`	Specifies whether to use early or late half delays. When `early` is specified, CCOPT uses only early path timing data to calculate effective maximum capacitance, for the specified clock edge. When `late` is specified, CCOPT uses only late path timing data to calculate effective maximum capacitance, for the specified clock edge. By default, if neither `early` or `late` are specified, CCOPT will use late half delays to calculate effective maximum capacitance.
pin | *port*	Specifies the pin for which the effective maximum capacitance value is to be returned. This is a required parameter.

`-source`	Reports the source of the effective maximum capacitance. It is a boolean type. The reported source may be any of the following: • `library_or_sdc`: Specifies that the most constraining capacitance came from a non-frequency dependent library constraint on a library cell pin or SDC override. This can also apply to clock roots based on the `source_driver` property where a clock root can be modeled as a specific type of library cell. • `freq_dep_library`: Specifies that the most constraining capacitance value came from a frequency-dependent library constraint. As per `library_or_sdc`, this can also apply to clock roots via library cell modeling. • `target_max_capacitance`: Specifies that the most constraining capacitance value came from an explicit `target_max_capacitance` property value. • `source_max_capacitance`: Specifies that the most constraining capacitance value came from the `source_max_capacitance` property. • `computed_source_max_capacitance`: Specifies that the most constraining capacitance value was computed by CCOpt for a clock root based on a library cell and a transition target. For more information about the above properties, use the following command: `get_ccopt_property -help property_name`
`-value`	Reports the effective maximum capacitance value of the specified pin.

Examples

- Use the following command to return the list of clock tree cells:
  ```
  get_ccopt_clock_tree_cells TEST*
  TEST_CONTROL_INST/CPF_LS_101_clk TEST_CONTROL_INST/g145 TEST_CONTROL_INST/g144 TEST_CONTROL_INST/g136 ...
  ```
- Use the following command to return the pins for the specified object:
  ```
  get_pins -of_object TEST_CONTROL_INST/g139
  TEST_CONTROL_INST/g139/A1 TEST_CONTROL_INST/g139/A2 TEST_CONTROL_INST/g139/B TEST_CONTROL_INST/g139/ZN
  ```
- Use the following command to return the source of the effective maximum capacitance value:
  ```
  get_ccopt_effective_max_capacitance TEST_CONTROL_INST/g139/ZN -source
  ```
  The software returns the following:
  ```
  library_or_sdc
  ```
- Use the following command to return the effective maximum capacitance value:
  ```
  get_ccopt_effective_max_capacitance TEST_CONTROL_INST/g139/ZN -value
  ```
  The software returns the following:
  ```
  0.0853199996948
  ```

get_ccopt_flexible_htrees

```
get_ccopt_flexible_htrees
[-help]
pattern
[-regexp]
```

This command returns the names of the flexible H-trees whose names match the specified pattern.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_flexible_htrees` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_flexible_htrees`.
`pattern`	Returns a list of flexible H-trees that match this pattern. It is a required parameter.
`-regexp`	When specified, treats all patterns as full Tcl regular expressions. If not specified, pattern is treated as a wildcard pattern.

Example

- The following command returns the list of all flexible H- trees that contain the word `htree`, which is a Tcl pattern match:

  ```
  get_ccopt_flexible_htrees htree -regexp
  htreeA htreeB
  ```

Related Commands

- `create_ccopt_flexible_htree`
- `delete_ccopt_flexible_htrees`
- `get_ccopt_property`
- `synthesize_ccopt_flexible_htrees`
- `set_ccopt_property`

get_ccopt_preferred_cell_stripe

```
get_ccopt_preferred_cell_stripe
[-help]
pattern
[-regexp]
```

Returns a list of preferred cell stripes objects matching the supplied pattern.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_preferred_cell_stripe` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_preferred_cell_stripe`.
`pattern`	Specifies the pattern for preferred cell stripes to return.
`-regexp`	Specifies whether or not to use regular expression matching.

Example

- The following command returns the list of all preferred cell stripes:

  ```
  get_ccopt_preferred_cell_stripe *
  stripes1 stripes2
  ```

Related Commands

- `create_ccopt_preferred_cell_stripe`
- `delete_ccopt_preferred_cell_stripe`

get_ccopt_property

```
get_ccopt_property
[-help]
name
[-cell library_cell_name]
[-clock_tree clock_tree_name]
[-clock_tree_source_group source_group_name]
[-delay_corner corner_name]
[-flexible_htree flexibleHtreeName]
[-help property_name]
[-inst instance_name]
[-lib_pin lib_pin_name]
[-list]
[-net net_name]
[-net_type leaf | trunk | top]
[-pin pin_name]
[-power_domain domain_name]
[-skew_group skew_group_name]
[-early | -late]
[-rise | -fall]
[-min | -max]
```

Retrieves the value of the specified CCOpt property. It can be used in the following ways:

1. To retrieve the value of a property. Some properties are global, and others are specific to a particular object. The command returns the value of the specified property when you use `get_ccopt_property property_name`.
   For example, use the following command to return the value for the maximum spatial density of clock tree cells.
   ```
   get_ccopt_property cell_density
   ```
   The software returns the following information:
   ```
   1
   ```
2. To retrieve a list of all the available CCOpt properties - in alphabetical order, run the following command:
   ```
   get_ccopt_property -help *
   ```
   The software displays the following information:
   ```
   add_driver_cell
   additional_buffer_depth
   additional_buffer_depth_skew_group_fraction
   add_exclusion_drivers
   adjacent_rows_legal

   ...............................
   ```
3. To retrieve a list of all the available properties that start with a word or a letter, for example "a", along with their brief descriptions, run the following command:
   ```
   get_ccopt_property -help a*
   ```
   The software displays the following information:
   ```
   add_driver_cell                              # Specify a driver cell to add for clock tree after root.
   add_exclusion_drivers                        # Setting this property true causes CCOpt to add extra
   drivers above exclude pins to remove them from the clock tree.
   additional_buffer_depth                      # Relaxes the max_buffer_depth constraint by an additional N
   stage depths, but only for the shortest paths.
   additional_buffer_depth_skew_group_fraction  # When using additional_buffer_depth, apply the relaxed
   ```

```
constraint to specified fraction of the skew group's shortest paths.
```

Note: If the wildcard that is used matches many properties, as seen in above example, you will see a brief description of each property. However, if the wildcard that is used matches a single option, for example, `balance_*`, then the detailed description of the property will be displayed as shown in below example.

4. The `get_ccopt_property` command is also used to query detailed information about a specified property when you use, `get_ccopt_property -help` *`property_name`* . The information displayed by the tool includes the usage, default value, valid values, and the object or objects that the property applies to. For example, the following command returns the information for the `balance_mode` property.

   ```
   get_ccopt_property -help clock_source_cells
   ```

   or

   ```
   get_ccopt_property -help clock_sou*
   ```

   The software displays the following information:

   ```
   Specifies the cells available for CTS to size clock sources if the property 'size_clock_source' is set to
   true. If none are specified CCOpt will choose cells from the libraries.

   Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match
   names.

   If set explicitly, CCOpt will ignore any don't use settings for the cells specified.

   Different cells may be specified for clock trees or power domains. Only clock sources that are buffers,
   inverters, logic and clock gating cells with a single output can be resized.

   Valid values: a list of library cell names, or a list of patterns to expand to library cell names

   Default: {}

   Optional applicable arguments: "-clock_tree <name>" and "-power_domain <name>"
   ```

For detailed information about how to use CCOpt properties, see the "CCOpt Property System" section in Clock Tree Synthesis chapter in *Innovus User Guide*. For detailed description of all public CCOpt properties, see the CCOpt Properties chapter in *Innovus User Guide.*

Parameters

`-help`	Outputs a brief description for the `get_ccopt_property` command. For a detailed description of the command, use the man command: `man get_ccopt_property`.
`-cell` *`library_cell_name`*	
	Specifies the library cell to which the specified property applies.
`-clock_tree` *`clock_tree_name`*	
	Specifies the name of the clock tree whose property is to be returned.
`-clock_tree_source_group` *`source_group_name`*	
	Specifies the name of the clock tree source group whose property is to be returned.
`-delay_corner` *`corner_name`*	
	Specifies the name of the delay corner whose property is to be returned.

`-early`	Specifies that the property applies to the early signal.
`-fall`	Specifies that the property applies to the fall signal.
`-flexible_htree` *flexibleHtreeName*	
	Specifies the name of the flexible H-tree whose property is to be returned.
`-help` *property_name*	Gets help for the specified property. All other options are ignored.
`-inst` *instance_name*	Specifies the instance to which the property applies.
`-late`	Specifies that the property applies to the late signal.
`-lib_pin` *lib_pin_name*	Specifies the library pin to which the specific property applies.
`-list`	Displays property values as a list.
`-max`	Specifies that the maximum value for the property be returned.
`-min`	Specifies that the minimum value for the property be returned.
name	Specifies the name of the property whose value is to be returned. This parameter is required.
`-net` *net_name*	Specifies the name of the net level to which the specified property applies.
`-net_type leaf | trunk | top`	
	Specifies the net type to which the property applies. It could be leaf net, trunk net, or top net.
`-pin` *pin_name*	Specifies the pin object whose property is to be returned.
`-power_domain` *domain_name*	
	Specifies the power domain to which the property applies.
`-rise`	Specifies that the property applies to the rise signal.
`-skew_group` *skew_group_name*	
	Specifies the name of the skew group to which the specified property applies.

Examples:

- The following command retrieves the value of the `use_inverters` property:

  ```
  get_ccopt_property use_inverters
  ```

  The software returns the following:

  ```
  auto
  ```

- The following command gets detailed help for the specified property:

  ```
  get_ccopt_property -help use_inverters
  ```

  The software displays the following information:

  ```
  Usage: get_ccopt_property use_inverters:
  Specifies whether clock tree synthesis should prefer to use inverters rather
  than buffers when balancing the clock tree. If set to true, CTS will use
  inverters for the clock tree balancing process. If set to false, CTS will use
  the minimum number of levels of inverters required to maintain logical
  correctness. If set to auto (the default) CTS will use what it considers to be
  the best combination of buffers and inverters to get optimal quality of
  results.

  Valid values: auto true false

  Default: auto

  Optional applicable arguments: "-clock_tree <name>".
  ```

get_ccopt_skew_group_delay

```
get_ccopt_skew_group_delay
[-help]
[-check_type {setup | hold}]
[-delay_corner delay_corner]
[-delay_type {early | late}]
[-edge {rise | fall}]
[-exclude_pin_insertion_delays]
-skew_group skew_group_name
[-skew | -longest | -shortest ]
[-path_length distance_metric | -summarize_stage_depth cell_type_list]
[-all_active_sinks | -to pin | -from pin | -through pin]
[-virtual_delays_only | -real_delays_only]
[-wire_delays_only | -cell_delays_only]
```

By default, this command returns the longest source-to-sink delay for the specified skew group. Alternatively, you can use `-shortest` to return the shortest source-to-sink delay, or `-skew` to return the difference between the shortest and longest source-to-sink delay.

Optional arguments let you restrict the set of pins considered. For example, use `-to` to return the longest delay to the specified sink pin, use `-delay_type` and `-delay_corner` to specify how delays are calculated, and use `-wire_delays_only` to specify which delays are considered.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_skew_group_delay` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_skew_group_delay`.
`-all_active_sinks`	Specifies that the result should be a tcl dict of pairs of sink and delay, describing delays for all the active sinks of the skew group. For example, `{sink_a latency_a sink_b latency_b ... sink_n latency_n}`.
`-cell_delays_only`	Specifies that CCOpt only considers cell delays when calculating delays and ignores wire delays.
`-check_type {setup | hold}`	
	Specifies whether to use setup or hold timing as the check type to use for the specified skew group. If a check type is specified, but the `-delay_type` parameter is not specified, the software behaves in the following manner: • `-check_type -setup` will mean `-delay_type -late` • `-check_type -hold` will mean `-delay_type -early` **Note**: If a check type is not specified, the software will always look at what the views permit, preferring the “setup” view if there is a choice.
`-delay_corner delay_corner`	

	Specifies the delay corner to use when calculating delays. If this parameter is not specified, the software will use the delay corner specified using the CCOpt property, `primary_delay_corner`. However, if no valid delay corner is found, the software will error out. **Note**: For detailed help on the CCOpt property, `primary_delay_corner`, run the following command: `get_ccopt_property -help primary_delay_corner`
`-delay_type {early | late}`	
	Specifies whether to use early or late half delays. When `early` is specified, CCOpt uses only early path timing data to calculate delay, for the clock edge specified. When `late` is specified, CCOpt uses only late path timing data to calculate delay, for the clock edge specified. **Note**: If the delay type is not specified but the check type is specified as “setup”, the software will consider the delay type as “late”. If the check type is “hold”, the software will consider the delay type as “early”.
`-edge {rise | fall}`	Specifies the edge of the specified pin for which delay information is to be calculated. When `fall` is specified, CCOpt uses only `falling` clock edge timing data to calculate delay. When `rise` is specified, CCOpt uses only `rising` clock edge timing data to calculate delay.
`-exclude_pin_insertion_delays`	Specifies that the delay should exclude pin insertion delays.
`-from` *pin*	Specifies the pin to query delays from. This means that only paths from the given pin to a sink of the skew group will be considered.
`-longest`	Specifies that CCOpt will return the delay of the longest source-to-sink path within the skew group. This is the default option.

`-path_length {half_perim pin_to_pin_steiner routed}`	Specifies that CCOpt will report by the distance from the root measured using the specified distance metric. You can choose to report for any of the following metrics:
	• `half_perim`: The sum of the Manhattan distances between terminals on the path. This is not blockage-aware and is suitable for unbuffered clock trees.
	• `pin_to_pin_steiner`: The sum of lengths calculated using a pin-to-pin steiner route. This is blockage-aware and is suitable for unbuffered clock trees.
	• `routed`: The sum of pin-to-pin paths calculated on the full steiner for each net. This is blockage-aware but is not suitable for unbuffered clock trees.
	The routed metric is best post-CTS as it measures the actual clock path. The other metrics are good for pre-CTS although they can also be calculated post CTS. For pre-CTS, the `half_perim` metric is fast to calculate while the other metrics are slow.
	Example:
	`get_ccopt_skew_group_delay -skew_group skew_group:clk/default_constraint_mode -longest -path_length half_perim 1177.8065`
	`get_ccopt_skew_group_delay -skew_group skew_group:clk/default_constraint_mode -longest -path_length half_perim -to pin:nastyclock/flop001/CK 930.0045`
	Note:
	• You can only specify one metric at a time.
	• You have to specify a skew group and that the length reported will be from the skew group sources to the skew group sinks. This may not cover the entire clock tree. The calculated length will take account of any cells on the clock path, which may increase the path length. The behavior is consistent with delay. The -longest, -shortest, and -skew options work the same. This means that the software looks at all skew group sinks and finds the one with the longest/shortest distance. This sink will not always be the same with the three metrics.
	• This parameter is mutually exclusive with the `-summarize_stage_depth` parameter.

`-real_delays_only`	Specifies that CCOpt only considers real delays in the design. It will not include the virtual delays added by trial CTS to resolve skew constraints.
`-shortest`	Specifies that CCOpt will return the delay of the shortest source-to-sink path within the skew group.
`-skew`	Specifies that CCOpt will return the difference between the shortest and longest source-to-sink delays within the skew group.
`-skew_group` *skew_group_name*	
	Specifies the name of the skew group for which the delay information will be returned. This is a required parameter.
`-summarize_stage_depth` *cellTypeList*	

	Specifies that the command will consider the number of cells of the specified type(s) in the tree, instead of considering delay. Possible values are buffer, inverter,logic, clock_gate, and generator. You can also specify * to include all cell types.
	For example, the following command tells you the number of buffers and inverters along the specified path type in the skew group, `PM_HL_FUNC`.
	`get_ccopt_skew_group_delay -summarize_stage_depth {buffer inverter} -skew_group m_dsram_clk/PM_HL_FUNC`
	Note: The * setting is not used in combination with any other cell type. For example, the below is not a valid setting.
	`-summarize_stage_depth {* buffer}`
	Note: This parameter is mutually exclusive with the `-path_length` parameter.

`-through` *pin*	Specifies the pin to query delays through. This means that only paths from a source of the given skew group, through this pin, and to a sink of the given skew group, will be considered.
`-to` *pin*	Specifies the pin to query delays to. This means that only paths from a source of the given skew group to this pin will be considered.
`-virtual_delays_only`	Specifies that CCOpt will return the skew, shortest path delay, or longest path delay only considering the virtual path delays (added by trial balancing) in the design and any user pin insertion delays applied before CTS. It will not include real delays added by clustering buffers and existing cells in the design.
`-wire_delays_only`	Specifies that CCOpt will return the skew, shortest path delay, or longest path delay only considering the wire delays in the design. (that is, ignoring cell delays)

Examples

- Use the following command to list all skew groups in all clocks:

  ```
  get_ccopt_skew_groups *
  m_clk/PM_HL_FUNC m_digit_clk/PM_HL_FUNC m_dsram_clk/PM_HL_FUNC m_ram_clk/PM_HL_FUNC m_rcc_clk/PM_HL_FUNC
  m_spi_clk/PM_HL_FUNC refclk/PM_HL_FUNC
  ```

- Use the following command to list the sinks in the specified skew group:

  ```
  get_ccopt_property sinks  -skew_group m_clk/PM_HL_FUNC
  TDSP_DS_CS_INST/g395/A1 ROM_512x16_0_INST/CLK SPI_INST/present_state_reg[0]/CP SPI_INST/dflag_reg/CP S..
  ```

- Use the following command to get the longest source to sink delay for the specified sink:`get_ccopt_skew_group_delay -skew_group m_clk/PM_HL_FUNC -to SPI_INST/dflag_reg/CP`

- Use the following command to get the number of buffers and inverters along the specified path type in the skew group, `PM_HL_FUNC`:

  ```
  get_ccopt_skew_group_delay -summarize_stage_depth {buffer inverter} -skew_group  m_dsram_clk/PM_HL_FUNC
  ```

  The software returns the following value:

  ```
  4
  ```

Related Information

- `get_ccopt_skew_groups`
- `get_ccopt_property`
- `get_ccopt_skew_group_path`
- `delete_ccopt_skew_groups`
- `modify_ccopt_skew_group`
- `report_ccopt_skew_groups`
- `set_ccopt_property`
- The following topics in the *Innovus User Guide*
  - Generating Reports in Clock Tree Synthesis
  - Manual Setup and Adjustment of the Clock Tree Specification

get_ccopt_skew_group_path

```
get_ccopt_skew_group_path
[-help]
[-check_type {setup | hold}]
[-delay_corner delay_corner]
[-delay_type {early | late}]
[-show_generator_paths]
-skew_group skew_group_name
[-longest  | -shortest]
[-summarize_stage_depth cell_type_list]
[-virtual_delays_only  | -real_delays_only]
[-wire_delays_only  | -cell_delays_only]
[-sink pin | -below pin]
```

This command returns the path delay information for the specified skew group. By default, this command returns the longest source-to-sink path in the specified skew group, which is the path with the largest delay. Paths are returned as a list of pins. You can use `-shortest` to return the shortest source-to-sink path rather than the longest.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_skew_group_path` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_skew_group_path`
`-below pin`	Specifies that CCOpt will only consider paths below this pin.
`-cell_delays_only`	Specifies that CCOpt will only consider cell delays (ignoring wire delays). By default both cell and wire delays are used to calculate delays.
`-check_type {setup | hold}`	
	Specifies whether the check type for the specified skew group should be setup or hold. If a check type is specified, but the `-delay_type` parameter is not specified, the software behaves in the following manner: • `-check_type -setup` will mean `-delay_type -late` • `-check_type -hold` will mean `-delay_type -early` **Note**: If a check type is not specified, the software will always look at what the views permit, preferring the “setup” view if there is a choice.
`-delay_corner delay_corner`	

	Specifies the delay corner to use when calculating delays. (use `all_delay_corners` to see all configured delay corners) If this parameter is not specified, the software will use the delay corner specified using the CCOpt property, `primary_delay_corner`. However, if no valid delay corner is found, the software will error out. **Note**: For detailed help on the CCOpt property, `primary_delay_corner`, run the following command: `get_ccopt_property -help primary_delay_corner`
`-delay_type {early | late}`	
	Specifies whether to use early or late half delays. When `early` is specified, CCOpt uses only early path timing data to calculate path delay, for the clock edge specified. When `late` is specified, CCOpt uses only late path timing data to calculate path delay, for the clock edge specified. **Note**: If the delay type is not specified but the check type is specified as “setup”, the software will consider the delay type as “late”. If the check type is “hold”, the software will consider the delay type as “early”.
`-longest`	Specifies that CCOpt will return the longest path delay within the skew group. This is the default option.
`-real_delays_only`	Specifies that CCOpt will only consider the real path delays in the design. It will not include the virtual path delays added by trial CTS to resolve skew constraints.
`-shortest`	Specifies that CCOpt will return the shortest source-to-sink path within the skew group (that is, the path with the smallest source-to-sink delay). By default, this command returns the longest path.
`-show_generator_paths`	Specifies that CCOpt follows generated clock tree paths when determining the longest source-to-sink path. By default generated clock tree paths are not followed.
`-sink` *pin*	Specifies that CCOpt will return the longest path to this pin for the specified skew group.
`-skew_group` *skew_group_name*	
	Specifies the name of the skew group for which path information will be returned. This is a required parameter.
`-summarize_stage_depth` *cell_type_list*	

	Specifies that the command will consider the number of cells of the specified type(s) in the tree, instead of considering delay. Possible values are buffer, inverter,logic, clock_gate, and generator. You can also specify * to include all cell types.
	For example, the following command shows you the path with most buffers and inverters in the skew group, `PM_HL_FUNC`.
	`get_ccopt_skew_group_path -summarize_stage_depth {buffer inverter} -longest -skew_group m_dsram_clk/PM_HL_FUNC`
	Note: The * setting is not used in combination with any other cell type. For example, the below is not a valid setting.
	`-summarize_stage_depth {* buffer}`

`-virtual_delays_only`	Specifies that CCOpt will return the shortest path delay or longest path delay only considering the virtual path delays (added by trial balancing) in the design and any user pin insertion delays applied before CTS. It will not include real path delays added by clustering buffers and existing cells in the design.
`-wire_delays_only`	Specifies that CCOpt will only consider wire delays (ignoring cell delays). By default both cell and wire delays are used to calculate delays.

Examples

- Use the following command to retrieve the list of skew groups:
  ```
  get_ccopt_skew_groups *
  m_clk/PM_HL_FUNC m_digit_clk/PM_HL_FUNC m_dsram_clk/PM_HL_FUNC m_ram_clk/PM_HL_FUNC m_rcc_clk/PM_HL_FUNC
  m_spi_clk/PM_HL_FUNC refclk/PM_HL_FUNC
  ```
- Use the following command to retrieve the paths with most buffers and inverters in the skew group, `PM_HL_FUNC`:
  ```
  get_ccopt_skew_group_path -summarize_stage_depth {buffer inverter} -longest -skew_group
  m_dsram_clk/PM_HL_FUNC
  ```

get_ccopt_skew_groups

```
get_ccopt_skew_groups
[-help]
pattern
[-regexp]
```

This command returns a list of skew groups whose names match the specified pattern.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_skew_groups` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_skew_groups`
`pattern`	Returns skew groups that match this pattern. This is a required parameter.
`-regexp`	When specified, treats all patterns as full Tcl regular expressions. If not specified, pattern is treated as a wildcard pattern.

Examples

- The following command returns all skew groups:
  ```
  get_ccopt_skew_groups *
  m_clk/PM_HL_FUNC m_digit_clk/PM_HL_FUNC m_dsram_clk/PM_HL_FUNC m_ram_clk/PM_HL_FUNC m_rcc_clk/PM_HL_FUNC
  m_spi_clk/PM_HL_FUNC refclk/PM_HL_FUNC
  ```
- The following command returns all skew groups associated with the clock, `m_digit_clk`:
  ```
  get_ccopt_skew_groups m_digit_clk*
  m_digit_clk/PM_HL_FUNC
  ```
- The following command returns all skew groups whose name contains the word "ram":
  ```
  get_ccopt_skew_groups ram -regexp
  m_dsram_clk/PM_HL_FUNC m_ram_clk/PM_HL_FUNC
  ```

get_ctd_win_id

```
get_ctd_win_id
[-help]
[-all]
[-detail]
```

Retrieves the IDs of the CTD windows. If no parameters are specified, the command retrieves the window ID of the current active CTD window. For example, if you create a window with the ID, `user_id`, and then run this command without specifying any parameters, the software displays the following information:

```
ctd_win -title my_title -id user_id
get_ctd_win_id
user_id
```

Note: Before using this command, ensure that a CTD window is open. You can open a CTD window using the `ctd_win` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ctd_win_id` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ctd_win_id`
`-all`	Retrieves the IDs of all CTD windows.
`-detail`	Retrieves the IDs of CTD windows, with a mapping to their titles.

Examples

- The following command retrieves the ID of all CTD windows in the current session:

  ```
  get_ctd_win_id -all
  ```

  user_id1 user_id2 user_id3

- The following command retrieves the IDs of CTD windows, with a mapping of their titles:

  ```
  get_ctd_win_id -detail
  ```

  ```
  user_id2 : Clock Tree Debugger : title2
  ```

  where, `user_id2` is the window ID, Clock Tree Debugger is the window type, and `title2` is the mapping title for this window.

get_ctd_win_title

```
get_ctd_win_title
[-help]
[-all | -id WindowIDName]
```

Retrieves the titles of the CTD windows. If no parameters are specified, the command retrieves the title of the current active CTD window.

Note: Before using this command, ensure that a CTD window is open. You can open a CTD window using the `ctd_win` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ctd_win_title` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ctd_win_title`
`-all`	Retrieves the IDs of all CTD windows.
`-id` *`WindowIDName`*	Retrieves the title of the CTD window with the specified ID. **Note**: The parameters, `-all` and `-id` are mutually exclusive.

Examples

- The following command retrieves the titles of all CTD windows in the current session:

  ```
  get_ctd_win_title -all
  ```

  ```
  {user_id1 : Clock Tree Debugger : title1} {user_id2 : Clock Tree Debugger : title2} {user_id3 : Clock Tree Debugger : title3}
  ```

- The following command retrieves the title of the CTD window with the ID, `user_id2`:

  ```
  get_ctd_win_title -id user_id2
  ```

  ```
  user_id2 : Clock Tree Debugger : title2
  ```

  where, `user_id2` is the window ID, Clock Tree Debugger is the window type, and `title2` is the mapping title for this window.

- Clock Menu chapter in the *Innovus Menu Reference.*

get_lib_clock_tree_path_delay

```
get_lib_clock_tree_path_delay
[-help]
-base_pin base_pin_name
[-delay_type {max | min}]
[-edge {rise | fall}]
[-mode analysis_mode_name]
[-power_domain power_domain_name]
-transition transition_time
-view analysis_view_name
```

This command retrieves information about the Liberty `max_clock_tree_path` and `min_clock_tree_path` delay attributes for a library pin. You can then use Tcl to apply the `set_clock_latency` command options, as required. The value returned by the `get_lib_clock_tree_path_delay` command is in the default system units, such that the user can pass to the `set_clock_latency` command directly. The same units are used for the `-transition` value.

If the library pin does not have a corresponding `min/max_clock_tree_path` delay attribute, the command returns a value of `0`. If other errors are encountered, the command fails.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_lib_clock_tree_path_delay` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_lib_clock_tree_path_delay`
`-base_pin` *`base_pin_name`*	Specifies the name of the base pin for which the `min/max_clock_tree_path` attribute value is to be retrieved. This is a required parameter.
`-delay_type {max | min}`	Specifies whether to use `max` or `min` delays. You can specify either `max` or `min` to retrieve the `max_clock_tree_path` and `min_clock_tree_path` delay values, respectively. *Default*: `max`
`-edge {rise | fall}`	Specifies whether the delay should be retrieved for the rising edge or the falling edge of the signal. *Default*: `rise`
`-mode` *`analysis_mode_name`*	Specifies the Liberty timing library mode value to be used while retrieving the delay attributes for the library pin. If no mode definition is available, the default look-up table (LUT) is used. The detailed use model is provided below. **User-Specified Item**: **Software Behavior** • mode + delay_type: Use the specified mode and the specified delay_type LUT • mode: Use the specified mode and the first max LUT • delay_type: Use the first specified delay type LUT • No mode and no delay type: Use the first max LUT For more information about setting modes, see `set_mode`.
`-power_domain` *`power_domain_name`*	Specifies the name of the power domain. This parameter is only required to be specified when the same base cell has different models between different power domains.
`-transition` *`transition_time`*	Specifies the input transition time. This is a required parameter.
`-view` *`analysis_view_name`*	Specifies the analysis view name. This is a required parameter.

Examples:

- Use the following command to retrieve the value of `max_clock_tree_path` delay at the rising edge of the specified pin:
  `get_lib_clock_tree_path_delay -base_pin macro_lib_cell/CLK -view setup_func_m40 -transition 0.1`
- Use the following command to retrieve the value of `min_clock_tree_path` delay at the falling edge of the specified pin:
  `get_lib_clock_tree_path_delay -base_pin macro_lib_cell/CLK -view setup_func_m40 -delay_type min -edge fall -transition 0.1`
- Use the following command to retrieve the value of `max_clock_tree_path` delay when `macro_lib_cell` is specified only in the `setup_func_m40c` view of `PD_TOP` power domain:
  `get_lib_clock_tree_path_delay -base_pin macro_lib_cell/CLK -view setup_func_m40 -power_domain PD_TOP -transition 0.1`

Related Command

- `set_clock_latency`

gui_zoom_ctd

```
gui_zoom_ctd
[-help]
[-id string]
[-in | -out | -selected]
[-vertical_range {ymin ymax}]
```

Zooms into or out of the CTD window.

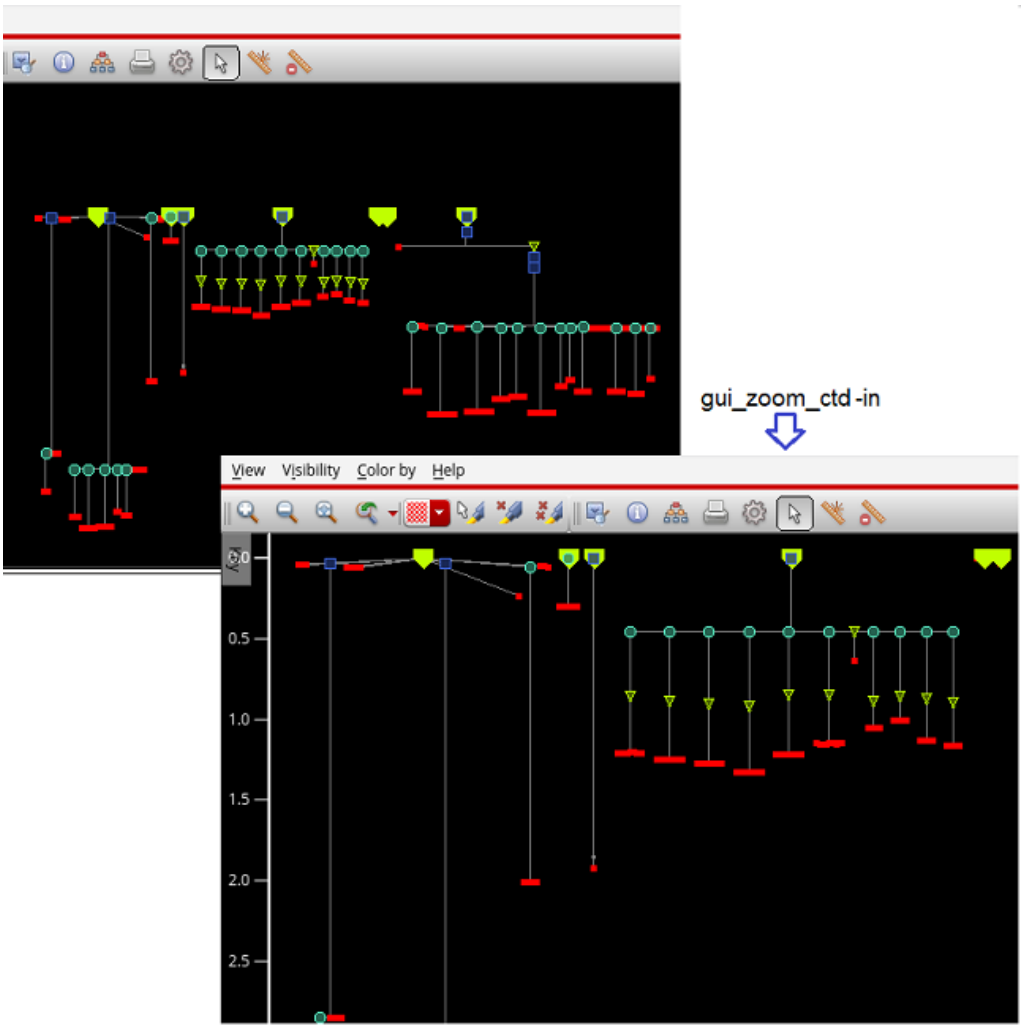
Parameters

`-help`	Prints a brief description of the `gui_zoom_ctd` command. For a detailed description of the command, use the `man` command: `man gui_zoom_ctd`
`-id string`	Specifies the window ID of the CTD window in which to zoom in or zoom out.
`-in`	Zoom into the CTD window.
`-out`	Zoom out of the CTD window.
`-selected`	Zoom to enclose all selected objects.
`-vertical_range {ymin ymax}`	Zoom to a specific vertical latency range. If CTD is in timing-based mode, the window will zoom to the clock tree parts where latency is between *ymin* and *ymax*, and the unit is the same as global timing unit. If CTD is in unit delay mode, the window will zoom to the clock tree parts where stage depth is between *ymin* and *ymax*. For example, if CTD is in timing-based mode, then the command, `gui_zoom_ctd -vertical_range {0 1.5}` will zoom to the clock tree parts where latency is between 0 and 1.5, the unit is the same as `get_time_unit`. If CTD is in unit delay mode, then the command, `gui_zoom_ctd -vertical_range {0 1.5}` will zoom to the clock tree parts where stage depth is between 0 and 1.5. **Note**: The window only zooms in vertical.

Examples

Use the following command to zoom in to the CTD:

```
gui_zoom_ctd -in
```



Select an instance and use the following command to zoom into the selected instance:

```
gui_zoom_ctd -selected
```

merge_clock_cells

```
merge_clock_cells
[-help]
[-only_above_flops]
[-only_clock_gates]
[-only_clock_logics]
```

When specified without any parameters, the command merges both clock gates and clock logic. You can specify the parameters, `-only_clock_gates` or `-only_clock_logics` to merge only clock gates or clock logics, respectively. The command ignores the settings of the `cts_merge_clock_logic and cts_merge_clock_gates` properties.

The log will show the names of instances that will be merged by saying, "Merging clock gates...", or "Merging clock logics", or "Merging clock gates and clock logics".

The summary tables in the log will list the number of instances that are merged. Running this command also sets the `cannot_merge_reason` property on the instances that could not be merged so the summary tables in the log will also provide reasons for why some instances could not be merged. This is shown in the "Examples" section below.

For details of all the above-mentioned properties, see the CCOpt Properties chapter of the *Innovus User Guide*.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `merge_clock_cells` parameter. For a detailed description of the command and all of its parameters, use the man command: `man merge_clock_cells`
`-only_above_flops`	Specifies that CCOpt should merge clock gates that only drive flops and not the ones that drive RAMs, latches, black boxes, or any other clock tree sink that is not a flop.
`-only_clock_gates`	Specifies that only clock gates should be merged and not clock logics.
`-only_clock_logics`	Specifies that only clock logics should be merged and not clock gates.

Examples

- When you run the following command, the summary table that is generated is shown below:
  ```
  merge_clock_cells -only_clock_gates
  ```

  Summary of the merge of duplicate siblings
  ```
  ------------------------------------------------------------
  Description                          Number of occurrences
  ------------------------------------------------------------
  Total clock gates                              2
  Globally unique enables                        1
  Potentially mergeable clock gates              1
  Actually merged clock gates                    0
  ------------------------------------------------------------
  ------------------------------------------------------
  Description                       Number of occurrences
  ------------------------------------------------------
  Total clock logics                         2
  Actually merged clock logics               0
  ------------------------------------------------------
  ------------------------------------------------------------
  Cannot merge reason                  Number of occurrences
  ------------------------------------------------------------
  UniqueUnderParent                              1
  ClockLogicMergingDisabledOnTree                2
  ------------------------------------------------------------
  ```
  In the above example, the first table is for clock gates – there are two in this design. No clock gates were merged.
  The second table is for clock logics – there are two in this design. No clock gates were merged.
  The third table provides the reasons as to why the instances could not be merged. Logic merging has been disabled because of the –only_clock_gates parameter. If the logics cannot be merged, then the clock gates are not siblings and cannot be merged.

- When you run the following command, the summary table that is generated is shown below.
  ```
  merge_clock_cells
  ```

  ```
  Summary of the merge of duplicate siblings
  ------------------------------------------------------
  Description                        Number of occurrences
  ------------------------------------------------------
  Total clock gates                           2
  Globally unique enables                     1
  Potentially mergeable clock gates           1
  Actually merged clock gates                 1
  ------------------------------------------------------
  ------------------------------------------------
  Description                      Number of occurrences
  ------------------------------------------------
  Total clock logics                        2
  Actually merged clock logics              1
  ------------------------------------------------
  ---------------------------------------------
  Cannot merge reason     Number of occurrences
  ---------------------------------------------
  UniqueUnderParent                1
  ---------------------------------------------
  ```

In the above example, the clock logics got merged - one logic got merged with its sibling logic. This means that the clock gates became siblings and were merged.

Related Information

`get_ccopt_property -help property_name`

modify_ccopt_skew_group

```
modify_ccopt_skew_group
[-help]
[-make_exclusive]
-skew_group skew_group_name
[-add_sinks pins | -remove_sinks pins]
[-add_ignore_pins pins | -remove_ignore_pins pins]
```

This command is used internally to add or remove sinks in existing skew groups produced automatically by the `create_ccopt_skew_group` command, but you can also use it to modify existing skew_group objects. Sinks and ignore pins can be added or removed using the appropriate switches.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `modify_ccopt_skew_group` parameter. For a detailed description of the command and all of its parameters, use the man command: `man modify_ccopt_skew_group`
`-add_ignore_pins pins`	Specifies the ignore pins to be added to the skew group.
`-add_sinks pins`	Specifies the sink pins to be added to the skew group.
`-make_exclusive`	When specified, sets the `exclusive_sinks_rank` property of the specified skew group (using the -skew_group parameter) to a value of one more than the current exclusive_sinks_rank of all skew groups sharing the current skew group mode.
`-remove_ignore_pins pins`	Specifies the ignore pins to be removed from the skew group.
`-remove_sinks pins`	Specifies the sink pins to be removed from the skew group.
`-skew_group skew_group_name`	Specifies the user-defined identifier for the skew group to be modified.

Example

- The following command specifies the sink pins to be added to the specified skew group:
  ```
  modify_ccopt_skew_group -skew_group clkA -add_sinks f1/ck
  ```

preserve_ccopt_port

```
  preserve_ccopt_port
[-help]
{[portname [-location {x y} | -reset ]] | -reset_all  | [-list  [-file filename]] | -tcl_list}
```

This command preserves module ports for the flexible h-tree feature. It can be used on any module port in the clock tree. It will preserve the specified module ports in both, clock tree synthesis and flexible h-tree synthesis. Any sinks connected downstream of the ports will remain downstream, and only those ports will be considered downstream.

Note: Currently, physical locations are only supported for flexible h-tree synthesis, and only on partition boundaries, although they will be accepted on all other module ports. Also, ports belonging to hInsts that have siblings but are not defined as partitions are not supported.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `preserve_ccopt_port` parameter. For a detailed description of the command and all of its parameters, use the man command: `man preserve_ccopt_port`
`-file` *`filename`*	Specifies the name of the preserved port list report.
`-list`	Prints a list of currently preserved ports.
`-location`	Provides the location of the preserved port specified using the *`portname`* parameter.
`portname`	Specifies the name of the port.
`-reset`	Resets the preservation settings for the preserved port specified using the *`portname`* parameter.
`-reset_all`	Resets all port preservation settings.
`-tcl_list`	Returns a tcl list of currently preserved ports. **Note**: The parameters, `-list` and `-tcl_list` are mutually exclusive.

Examples

- Use the following command to mark a port on a partition boundary as preserved and set the location:
  ```
  preserve_ccopt_port m0/ck -location {100 100}
  ```
- Use the following command to see the report, which shows both the port that was set and its sibling:
  ```
  preserve_ccopt_port -list
  Port m0/ck fixed at (100.000,100.000)
  Sibling port m1/ck fixed at (900.960,100.000)
  ```
- Use the following command to view the report of preserved ports as a tcl list:
  ```
  preserve_ccopt_port -tcl_list
  ```
  The software returns the following information:
  ```
  {m0/ck 100.0 100.0} {m1/ck 900.96 100.0}
  ```

- Use the following command to reset the port, in this case by specifying the sibling:
  ```
  preserve_ccopt_port -reset m1/ck
  ```
  Now both ports have been cleared
  ```
  preserve_ccopt_port -list
  ```
  The software returns nothing.

report_ccopt_cell_filtering_reasons

```
report_ccopt_cell_filtering_reasons
[-help]
[-cell_type buffer | inverter | logic | delay | clock_gate]
[-clock_trees {string1 string2 ...}]
[-file file_name]
[-power_domain power_domain_name]
[-tcl_list]
```

Reports the reasons for filtering the specified cell types. The report can be saved as a file by specifying the `-file` parameter of the command or it can be viewed as a Tcl list by specifying the `-tcl_list` parameter. The output of the command is also included in the log.

In the report, "all" is used for the Clock tree names where the reason is common to all clock_trees. Some of the reasons for filtering that are reported and their brief descriptions are provided below:

- `Unbalanced rise/fall delays` : The difference between rise and fall delays for the cell is bigger than 20%, or any of rise or fall timing arcs is missing in the library.
- `Too tall`: The cell height is bigger than the maximum cell height specified using the `max_cell_height` property.
- `Wrong power context` : The cell does not match the power context requirements. For example, do not have same power context on all pins.
- `Not available in all views` : The cell is not available in all analysis views because the library does not contain all the specified views (corner cases) in the design for that specific cell. To avoid this filtering, check the libraries and the MMMC configuration to see why the cell is not available in some views.
- `Always on but not in cpf`: The cell is marked as always on but does not match the CPF description. You can avoid this filtering by checking/updating the CPF.
- `Weak max cap cell`: The cell is unable to drive enough capacitance at certain clock frequencies. This check is controlled by the CCOpt property, `frequency_dependent_max_cap_usability_check_max_cap_fanout_factor`. The default value of this property is 4. The cells that cannot drive four instances of that cell are filtered. You can reduce this value to avoid the filtering, for example, by relaxing the requirement so that the cell only has to be able to drive one or two instances. Alternatively, since this is controlled by the period on the clock_tree, you can check the `effective_clock_period` property to see if those are correct.
- `Library trimming`: The cell was removed automatically because it is an inefficient cell. The cell was removed as an inefficient cell to reduce the library size and save runtime. To avoid removing such cells, disable library trimming.
- `Can't use due to library mismatch`: Check the library data for the cell - both timing and physical data for the cell are needed. There is a mismatch between LEF and liberty libraries because the cell is missing in one of them.
- `Invalid for balancing`: The cell is filtered out because it does not match several predefined properties for balancing, such as: 1) cell delay is too small; 2)cell has an invalid (rise/fall) timing arc.
- `No test enable signal`: The clock gate cell is filtered out because it does not have a test enable input.
- `Has test enable signal`: The clock gate cell is filtered out because it has a test enable input.
  Note: The above two cell filtering reasons are context dependent. The software filters all clock gates, reporting the clock gates with test enables as one set and the clock gates without test enables as another set. A clock gate either has a test enable or it does not have one, so all clock gates are listed in one of the two sets. However, if you need a clock gate with no test enable signal, but there are no such clock gates, you can use a clock gate that has a test enable signal. But the other way around is not possible, which means if you need a clock gate with test enable signal but there is no such clock gate, you cannot use one that does not have a test enable signal.

- `Has observable output`: Clock gates without observability outputs are preferred, if they are available. Normally any cells with observability outputs will be filtered out. But if all the available cells have observability outputs they will not be filtered.
- `Edge sensitive`: The clock gate cell is filtered out because it is not positive edge sensitive.
- `Cannot be legalized`: The cell is filtered because it cannot physically be legalized in the power domain.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_cell_filtering_reasons` parameter. For a detailed description of the command and all of its parameters, use the man command: man `report_ccopt_cell_filtering_reasons`.
`-cell_type buffer | inverter | logic | delay | clock_gate`	
	Restrict the report the specified library cell type.
`-clock_trees {string1 string2 ...}`	
	Restricts the report to the specified clock trees
`-file` *file_name*	Specifies that a copy of the contents of the report will be saved to the specified file name.
`-power_domain` *power_domain_name*	Restricts the report to the specified power domain.
`-tcl_list`	Returns the report as Tcl formatted data, and formats the `-file` as tcl, if specified.

Examples

- Use the following command to filter reasons for clock gate cell types:

```
report_ccopt_cell_filtering_reasons -cell_type clock_gate

Filtering reasons for cell type: clock gate cell
================================================

-------------------------------------------------------------------------------------------------
Clock trees Power domain   Reason                  Library cells
-------------------------------------------------------------------------------------------------
{ clk4 }    auto-default   No test enable signal  { TLATNCAX12 TLATNCAX16 TLATNCAX2 TLATNCAX20
                                                    TLATNCAX3 TLATNCAX4 TLATNCAX6
                                                    TLATNCAX8 }
{ clk4 }    auto-default   Has test enable signal { TLATNTSCAX12 TLATNTSCAX16 TLATNTSCAX2
                                                    TLATNTSCAX20 TLATNTSCAX3 TLATNTSCAX4
                                                    TLATNTSCAX6 TLATNTSCAX8 }
-------------------------------------------------------------------------------------------------
```

- Use the following command to filter reasons for buffer cell types:

```
report_ccopt_cell_filtering_reasons -cell_type buffer

Example output format:

Filtering reasons for cell type: buffer
=======================================

-----------------------------------------------------------------------------
Clock trees   Power domain   Reason             Library cells
-----------------------------------------------------------------------------
all           AO             Library trimming  { BUFFD12BWP BUFFD2BWP BUFFD3BWP
                                                   BUFFD4BWP BUFFD6BWP BUFFD8BWP
                                                   PTBUFFD2BWP }
all           PLL            Unbalanced        { BUFFD12BWP BUFFD2BWP BUFFD3BWP

  - `effective_clock_period`

  For details, see the CCOpt Properties chapter in the *Innovus User Guide*.
- The following topic in the *Innovus User Guide*
  - Generating Reports in Clock Tree Synthesis

report_ccopt_cell_halo_violations

```
report_ccopt_cell_halo_violations
[-help]
[-add_markers | -clear_markers]
[-file fileName]
[-num number]
[-summary]
```

This command is used to report clock instances with clock halo violations.

By default, when the command is specified without any arguments, it will check for halo violations for clock halos defined using all of the following CCOpt property pairs:

- `cell_halo_x` / `cell_halo_y`
- `cell_density` / `adjacent_rows_legal`
- `cell_halo_sites` / `cell_halo_rows`

The report can be viewed as a text file and in the Violation Browser within the Innovus GUI.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_cell_halo_violations` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_ccopt_cell_halo_violations`
`-add_markers`	Adds any detected clock halo violations to the Violation Browser.
`-clear_markers`	Removes any markers added to the Violation Browser by the `report_ccopt_cell_halo_violations` command.
`-file` *`fileName`*	Specifies the name of the file in which the contents of the report will be saved.
`-num` *`number`*	Specifies the number of violations to report for each clock.
`-summary`	Prints a report providing information about the instances with cell halos and the instances with cell halo violations or "Failed instances". This report contains a summary table titled, "Clock Cell Halo Rule Check in Summary".

Example

The following command prints the summary of the cell halo violation report:

```
report_ccopt_cell_halo_violations -summary
```

The software prints the following report:

```
Clock Cell Halo rule Check in Summary
=====================================

-------------------------------------------------------
Clock       Instances with cell_halo Failed Instances
-------------------------------------------------------
```

```
funcclk1            4                   3
funcclk2            4                   3
funcclk3            4                   2
-------------------------------------------------------
total number of violating instances: 8
```

Use the following command to view the detailed "Clock Cell Halo Rule Violations" table.

```
report_ccopt_cell_halo_violations
```

The software prints the following report:

```
Clock Cell Halo Rule Violations
*******************************
```

No.	Cell	Instance	In clock	Power domain	Cell Halo (x, y)	Violating instance	From clock	Intrusion (x, y)
1	INVD1BWP	RESULTS_CONV_INST/g18692	m_rcc_clk	TD8PCore	(3, 0)	RESULTS_CONV_INST/RC_CG_HIER_INST8/RC_CGIC_INST	m_rcc_clk	(2.94, 1.26)
2	INVD1BWP	RESULTS_CONV_INST/g18693	m_rcc_clk	TD8PCore	(3, 0)	RESULTS_CONV_INST/RC_CG_HIER_INST9/RC_CGIC_INST	m_rcc_clk	(2.94, 1.26)
3	INVD1BWP	RESULTS_CONV_INST/g18688	m_rcc_clk	TD8PCore	(3, 0)	RESULTS_CONV_INST/RC_CG_HIER_INST8/RC_CGIC_INST	m_rcc_clk	(2.58, 1.26)

Note: The "Power Domain" column helps to understand where the halo value comes from in the case where the halo has been set per power domain.

Use the following set of commands to view the clock halo violations in the Violation Browser

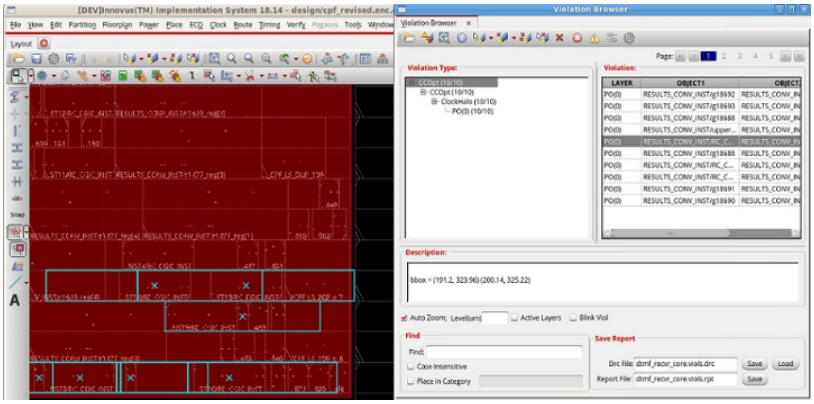
Create cell halo violations using the following property:

```
set_ccopt_property cell_halo_x 3
```

Use the following command to add the detected clock halo violations to the Violation Browser and display them in the GUI:

```
report_ccopt_cell_halo_violations -add_markers
```

You will see the following:



Use the following command to clear the clock halo violations in the Violation Browser and delete markers in the GUI:

```
report_ccopt_cell_halo_violations -clear_markers
```

You will see the following:

The following topic in the *Innovus User Guide*

- Clock Cell Halo Violations Reporting

report_ccopt_clock_tree_convergence

```
report_ccopt_clock_tree_convergence
[-help]
[-file fileName]
```

This command is used to report a summary of the convergence above clock sinks and to identify the names of sinks with the highest number of clock path networks. If there are sinks with many paths leading to them, there can be a considerable impact on runtime. Reducing the complexity of the logic, or excluding sinks that need not have timing constraints from the clock trees can help improve runtime. An example of the report is shown below.

```
Convergence above clock sinks
=============================
-----------------------------------------------------------------
Number of paths to sink PIOs DFFs  Other sinks Total
-----------------------------------------------------------------
1                       1    10118 0          10119
8                       54   2134  183        2371
16                      13   311   18         342
32                      2    0     0          2
700                     3    164   5          172
1400                    5    0     0          5
-----------------------------------------------------------------
Sinks with most paths leading to them
=====================================
---------------------------------
Sink             Number of paths
---------------------------------
Owest/nout[0]    1400
Owest/nout[1]    1400
Owest/nout[2]    1400
Owest/nout[3]    1400
Owest/nout[4]    1400
---------------------------------
---------------------------------
```

In the above sample report, 5 primary IOs have 1400 paths leading to them from the clock sources.The report also shows a table with the names of sinks with most paths leading to them. In the "Sinks with most paths leading to them" section of the report, the five sinks, `Owest/nout[n]`, have 1400 paths leading to them. These sinks are likely to be problematic and need to be checked.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_clock_tree_convergence` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_ccopt_clock_tree_convergence`
`-file` *`fileName`*	Specifies the file name in which the report will be saved.

Related Information

- The following topic in the *Innovus User Guide*
  - Clock Tree Convergence Reporting

report_ccopt_clock_tree_drv

```
report_ccopt_clock_tree_drv
[-help]
[-clock_trees {list_of_clock_trees}]
[-delay_corners list_of_delay_corner_names]
[-drv_types {transition max_cap max_source_to_sink_net_length}]
[-early]
[-exclude_violation_types {dont_touch_nets pre_routed_nets}]
[-file file_name]
[-late]
[-num_nets num | all]
[-views {list_of_views}]
```

This command is used to report design rule violations (DRVs) in the clock network.

The report consists of three sections:

1. Constraint summary: Lists all the implicit and explicit targets that CTS is targetting, along with which corners are being constrained.
2. Violation summary: Counts nets in the DAG with what types of violations exist.
3. Top N detailed net violation listing: Outputs a detailed list of nets that have violations.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_clock_tree_drv` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_ccopt_clock_tree_drv`
`-clock_trees {`*`list_of_clock_trees`*`}`	Restricts the report to the specified clock trees. By default, it reports DRVs for all clock trees.
`-delay_corners` *`list_of_delay_corner_names`*	Filters the report for a specific constrained delay corner. By default, it reports for all delay corners.
`-drv_types {transition max_cap max_source_to_sink_net_length}`	Filters to choose the types of violation to report on. By default, all types of violations are reported.
`-early`	Reports only the early half of the delay corners.
`-exclude_violation_types {dont_touch_nets pre_routed_nets}`	Specifies certain nets to be excluded if they are known to be not fixable. By default, all nets are included. You can choose to exclude dont_touch nets and pre-routed nets.
`-file file_name`	Saves a copy of the contents of the report to the specified file name. *Default*: `{}`
`-late`	Reports only the late half of the delay corners.
`-num_nets num | all`	Specifies the number of nets for which the violations should be reported. You can specify a number or specify all to report for all nets. By default, violations are rpeorted for 10 nets.
`-views {`*`list_of_views`*`}`	Restricts the report to the delay corners associated with the specified views.

Example

Use the following command to report the violations for all nets in the specified report file:

```
report_ccopt_clock_tree_drv -num_nets all -out_file report_file1
```

For sample report, see Clock Tree Network DRV Reporting.

Related Information

- `create_ccopt_clock_tree_spec`
- Clock Tree Synthesis chapter in the *Innovus User Guide*.

report_ccopt_clock_tree_structure

```
report_ccopt_clock_tree_structure
[-help]
[-check_type {setup | hold}]
[-clock_trees {list_of_clock_trees}]
[-delay_corner corner_name]
[-delay_type {early | late}]
[-expand_below_logic]
[-expand_generated_clock_trees {independently | inline | independently_and_inline}]
[-include_reporting_only_skew_groups]
[-file file_name]
[-show_sinks]
[-update_timing]
```

Reports the structure of the clock network as a text report. When the command is run without specfying the `-update_timing` parameter, the report format is as follows:

- The summary information is added below the name of the clock tree
- The slew, capacitance, and co-ordinate information is not included
- The input and output pin information is merged in a single line

For details, see the examples below.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_clock_tree_structure` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_ccopt_clock_tree_structure`
`-check_type {setup | hold}`	Specifies whether setup or hold views are used for the report. By default, setup view is used for the report.
`-clock_trees {list_of_clock_trees}`	Restricts the report to the specified clock trees.
`-delay_corner corner_name`	Reports in the specified delay corner. By default, the software will use the primary-half delay corner that is set using the CCOpt property, `primary_delay_corner`. Use the `get_ccopt_delay_corner` command to retrieve the name of the CCOpt primary-half delay corner.
`-delay_type {early | late}`	Reports in the specified delay type, early or late. When late is specified, only the late half of the delay corners are reported. When early is specified, only the early half of the delay corners are reported. By default, late half of the delay corners are reported.

`-expand_below_logic`	When this parameter is specified, the subtree below each multi-input logic will be printed in its entirety every time it is encountered. When this parameter is not specified, then by default, the clock tree below a multi-input clock logic is reported only once, which is at the first place it is encountered in the report. Subsequent visitations of the subtree will simply note the presence of an omitted subtree, for example, "...71 `fanout omitted`". **Note**: For clock networks with ladders of reconverging clock logic, this can produce large volumes of output.
`-expand_generated_clock_trees {independently | inline | independently_and_inline}`	
	Specifies how generated clock trees should be displayed. The following options are available: `independently`: display generated clock trees at the top level. This is the default display. `inline` : display generated clock trees as fanout of their generator inputs `independently_and_inline`: display generated clock trees both at the top level and as fanout of their generator inputs
`-file` *file_name*	Saves a copy of the report in the specified file. *Default*: `{}`
`-include_reporting_only_skew_groups`	When specified, the report additionally includes the reporting-only skew groups. A reporting-only skew group is a skew group whose `constrains` property is set to `none`. Such a skew group imposes no clock balancing constraint and will not be considered by CTS. By default, the reporting-only skew groups are not included in the report.
`-show_sinks`	Includes all clock network sinks in the report. This parameter controls whether the clock network sinks, which are the non-generator flops/latches, are included in the report or not. By default, these are not included in the interest of minimizing the report output. Instead, a count of the number of sinks is displayed,for example. `"... 209 sinks omitted"`. When this parameter is specified, per-skew group latencies for each sink are included. **Note**: The report identifies macros in the clock tree. This means that if your clock sink is a macro, the report will show “macro sink” instead of just “sink”.
`-update_timing`	When specified, the report includes detailed timing information including pin slew, capacitance, and location along with the clock tree structure.

Examples

- Use the following command to report the structure of the clock network for the specified clock trees, `m_clk` and `m_digit_clk`:

  ```
  report_ccopt_clock_tree_structure -clock_trees {m_clk m_digit_clk}
  ```

  A part of the report is shown below.

  ```
  Clock tree m_clk:
  Total FF: 115
  ```

```
Max Level: 5
  (L1) TEST_CONTROL_INST/g137/ZN (ND2D1BWP)
  \_  (L1) port TEST_CONTROL_INST/m_clk
       \_ ... (21 sinks omitted)
       \_  (L2) DMA_INST/CPF_LS_158_m_clk/I -> Z (LVLHLD2BWP)
        |   \_ ... (8 sinks omitted)
        |   \_  (L3) DMA_INST/RC_CG_HIER_INST0/RC_CGIC_INST/CP -> Q (CKLNQD1BWP)
        |       \_ ... (8 sinks omitted)
        \_  (L2) RESULTS_CONV_INST/CPF_LS_159_m_clk/I -> Z (LVLHLD2BWP)
        |   \_ ... (15 sinks omitted)
        |   \_  (L3) RESULTS_CONV_INST/RC_CG_HIER_INST1/RC_CGIC_INST/CP -> Q (CKLNQD1BWP)
        |   |   \_ ... (9 sinks omitted)
        |   \_  (L3) RESULTS_CONV_INST/RC_CG_HIER_INST2/RC_CGIC_INST/CP -> Q (CKLNQD1BWP)
        |   |   \_ ... (16 sinks omitted)
```

.....

```
Clock tree m_digit_clk:
 Total FF: 9
 Max Level: 3
   (L1) TEST_CONTROL_INST/g141/ZN (IOA21D1BWP)
   \_  (L1) port TEST_CONTROL_INST/m_digit_clk
        \_ ... (9 sinks omitted)
```

- Use the following command to report the structure of the clock network inlcuding the timing information for the specified clock tree, `m_clk`:

```
report_ccopt_clock_tree_structure -clock_trees {m_clk} -update_timing
```

```
Clock tree m_clk:
TEST_CONTROL_INST/g137/ZN root output at (273.210,301.000), lib_cell ND2D1BWP, level 1, slew 9.719ns, wire_cap

     wire_cap 0.021pF, load_cap 0.015pF
```

- Use the following command to report the structure of the clock network with generated clock trees expanded inline for the specified clock trees, `m_clk` and `m_digit_clk`:

```
report_ccopt_clock_tree_structure -clock_trees {m_clk m_digit_clk} -expand_generated_clock_trees inline
```

```
Clock tree m_clk:
Total FF: 115
```

```
Max Level: 5
(L1) TEST_CONTROL_INST/g137/ZN (ND2D1BWP)
\_  (L1) port TEST_CONTROL_INST/m_clk
   \_ ... (21 sinks omitted)
   \_   (L2) DMA_INST/CPF_LS_158_m_clk/I -> Z (LVLHLD2BWP)
   |    \_ ... (8 sinks omitted)
   |    \_ (L3) DMA_INST/RC_CG_HIER_INST0/RC_CGIC_INST/CP -> Q (CKLNQD1BWP)
   |        \_ ... (8 sinks omitted)
   \_   (L2) RESULTS_CONV_INST/CPF_LS_159_m_clk/I -> Z (LVLHLD2BWP)
   |    \_ ... (15 sinks omitted)
   |    \_ (L3) RESULTS_CONV_INST/RC_CG_HIER_INST1/RC_CGIC_INST/CP -> Q (CKLNQD1BWP)
   |   |    \_ ... (9 sinks omitted)
   |    \_ (L3) RESULTS_CONV_INST/RC_CG_HIER_INST2/RC_CGIC_INST/CP -> Q (CKLNQD1BWP)
   |   | \_ ... (16 sinks omitted)
   |    \_ (L3) RESULTS_CONV_INST/RC_CG_HIER_INST3/RC_CGIC_INST/CP -> Q (CKLNQD1BWP)

report_ccopt_clock_trees

```
  report_ccopt_clock_trees
[-help]
[-clock_trees {list_of_clock_trees}]
[-delay_corners {list_of_delay_corners} | -views {list_of_views}]
[-file file_name]
[-histograms]
[-list_special_pins]
[-no_invalidate]
[-num_cap_violating_pins number_of_pins]
[-num_fanout_violating_nets number_of_nets]
[-num_length_violating_nets number_of_nets]
[-num_resistance_violating_nets number_of_nets]
[-num_slew_violating_pins number_of_pins]
[-skip_timing_update]
[-summary]
[-tcl_list]
[-early | -late]
```

This command reports a summary of all defined clock trees. In particular, this report provides a summary of numbers of clock gates at different depths in each clock tree. Use the `report_ccopt_clock_trees` command to monitor the amount of clock gating used in the design and the buffering used in the clock tree. You can run this command any time after defining or extracting clock trees.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_clock_trees` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_ccopt_clock_trees`
`-clock_trees {list_of_clock_trees}`	
	Specifies that the report will be restricted to the specified clock trees.
`-delay_corners {list_of_delay_corners}`	
	Specifies that the report will be restricted to the specified delay corners. **Note**: The `-delay_corners` and `-views` parameters are mutually exclusive.
`-early`	Specifies that only the early half of the delay corners will be reported.
`-file file_name`	Specifies that a copy of the contents of the report will be saved to the specified file name.
`-histograms`	Specifies that histograms of key information will be displayed.
`-late`	Specifies that only the late half of the delay corners will be reported.
`-list_special_pins`	Specifies that the report will list individual pins that are stop, ignore, min, or other special type of pins.

`-no_invalidate`	Specifies that the timing engine should not be invalidated. The timing engine is used to calculate the timing data that is displayed in the report. By default, this is invalidated when you generate the report, so all the timing data is recalculated. This increases the time taken to generate the report. Use the `-no_invalidate` option to reuse the existing timing data for the report.
`-num_cap_violating_pins` *number_of_pins*	
	Specifies the maximum number of capacitance violating pins reported in the "Max capacitance violation summary across all clock trees" table of the report. By default, the software reports the top 10 violations.
`-num_fanout_violating_nets` *number_of_nets*	
	Specifies the maximum number of violating fanout nets reported in the "Max fanout violation summary across all clock trees" table of the report. By default, the software reports the top 10 violations.
`-num_length_violating_nets` *number_of_nets*	
	Specifies the maximum number of `max_source_to_sink_net_length` violating nets reported in the "Max length violation summary across all clock trees" table of the report. By default, the software reports the top 10 violations.
`-num_resistance_violating_nets` *number_of_nets*	
	Specifies the maximum number of `max_source_to_sink_net_resistance` violating nets reported in the "Max resistance violation summary across all clock trees" table of the report. By default, the software reports the top 10 violations.
`-num_slew_violating_pins` *number_of_pins*	
	Specifies the maximum number of worst slew violating pins that are reported in the "Slew violation summary across all clock trees" table. By default, the software reports the top 10 violations.
`-skip_timing_update`	Specifies that the timing engine should not be updated. The timing engine is used to calculate the timing data that is displayed in the report. By default, when you generate the report, the timing data is recalculated. This increases the time taken to generate the report. Specify this parameter to skip calculation of timing data.
`-summary`	Specifies that just the summary table should be displayed in the report.
`-tcl_list`	Specifies that the report will be created as Tcl data instead of a text report.
`-views {`*list_of_views*`}`	Restricts the report to the delay corners associated with the specified views. **Note**: The `-delay_corners` and `-views` parameters are mutually exclusive.

Examples

Example1: **Clock Timing Summary table**

```
Clock Timing Summary:

report_ccopt_pin_insertion_delays

```
  report_ccopt_pin_insertion_delays
[-help]
[-bin_size string]
[-check_type {setup | hold}]
[-clock_trees {string1 string2 ...}]
[-delay_corner delay_corner_name]
[-delay_type {early | late}]
[-file file_name]
[-skew_groups {string1 string2 ...} | -include_reporting_only_skew_groups]
[-sources {string1 string2 ...}]
```

Reports pin insertion delays at clock tree sinks. By default, the report visits all the clock tree sinks, and checks for pin insertion_delay at each sink. Statistics about the distribution of pin insertion_delay values are generated and reported. The report provides a quick overview of the distribution and nature of the pin insertion delays found, which can be used to identify the problem areas such as excessively large skews, surprisingly numerous skews, or large numbers of small skews, and so on.

The `-clock_trees` and `-skew_groups` parameters are used to restrict the scope of the report as a subset of the clock tree sinks, which means that when the `-clock_trees` parameter is specified, only those sinks that are under the listed clock trees are selected, and when the `-skew_groups` parameter is specified, only those sinks that are under the listed skew groups are selected. By default, the report analyzes the pin insertion delays that are found under the CCOpt primary half corner. The `-delay_corner`, `-check_type`, and `-delay_type` parameters permit the selection of another half corner to report against.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_pin_insertion_delays` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_ccopt_pin_insertion_delays`
`-bin_size string`	Specifies a bin (bucket) size for the report histograms. By default the software uses the histogram bin size specified using the CCOpt property, pin_insertion_delay_histogram_bin_size. Use this parameter to override this default bin size value. For details, see CCOpt Properties in the *Innovus User Guide*.
`-check_type {setup | hold}`	
	Specifies the check type for the specified skew group to be reported. You can specify either `setup` or `hold`. If a check type is specified, but the `-delay_type` parameter is not specified, the software behaves in the following manner: • `-check_type -setup` will mean `-delay_type -late` • `-check_type -hold` will mean `-delay_type -early` **Note** : If a check type is not specified, the software will always look at what the views permit, preferring the “setup” view if there is a choice.
`-clock_trees {string1 string2 ...}`	

	Restricts the report to the specified clock trees. This means that only those sinks that are under the specified clock trees are selected for reporting. *Default*: all defined clock trees
`-delay_corner` *`delay_corner_name`*	
	Reports in the specified delay corner. By default, the software will use the primary-half delay corner that is set using the CCOpt property, `primary_delay_corner` .
`-delay_type {early | late}`	
	Reports in the specified delay type, `early` or `late`. When `late` is specified, only the late half of the delay corners are reported. When `early` is specified, only the early half of the delay corners are reported. *Default:* `late`
`-file` *`file_name`*	Specifies that a copy of the contents of the report be saved to the specified file name.
`-include_reporting_only_skew_groups`	When specified, the report additionally includes the reporting-only skew groups. A reporting-only skew group is a skew group whose `constrains` property is set to `none`. Such a skew group imposes no clock balancing constraint and will not be considered by CTS. By default, the reporting-only skew groups are not included in the report. If a reporting-only skew group is explicitly specified using the `-skew_groups` parameter, then that skew group is always included in the report output. **Note**: The `-include_reporting_only_skew_groups` and `-skew_groups` parameters are mutually exclusive. If both these parameters are specified together, the software errors out.
`-skew_groups {string1 string2 ...}`	
	Restricts the report to the specified skew groups. This means that only those sinks that are under the specified skew groups are selected for reporting. **Note**: The `-include_reporting_only_skew_groups` and `-skew_groups` parameters are mutually exclusive. If both these parameters are specified together, the software errors out. *Default*: all defined skew groups

`-sources {string1 string2 ...}`	Restricts the report to skew group sink pins that have a pin insertion delay value from one of the listed sources.
	This `-sources` list of categories takes wildcard values that are expanded to matching categories.
	For example:
	`report_ccopt_pin_insertion_delays -sources u*`
	This is equivalent to:
	`report_ccopt_pin_insertion_delays -sources {useful_skew user}`

Example

The following command reports the pin insertion delays at all clock tree sinks.

```
report_ccopt_pin_insertion_delays
```

Note: The CCOpt pin insertion delays are +ve valued if they produce an advance, and -ve valued if they produce a delay. This can be viewed in the report output shown below.

```
Positive (advancing) pin insertion delays

  - Generating Reports in Clock Tree Synthesis

report_ccopt_preserved_clock_tree_ports

```
  report_ccopt_preserved_clock_tree_ports
[-help]
[-out_file filename]
[-tcl_list]
```

This command reports all currently preserved ports set using the `set_ccopt_preserved_clock_tree_port` command. You can choose to save the information in a file or view it as a tcl list by using the relevant parameter.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_preserved_clock_tree_ports` parameter. For a detailed description of the command, use the man command: `man report_ccopt_preserved_clock_tree_ports`
`-out_file filename`	Specifies the name of the preserved port list report file.
`-tcl_list`	Returns a tcl list of currently preserved ports.

Example

- Use the following command to view the report of preserved ports as a tcl list:
  ```
  report_ccopt_preserved_clock_tree_ports -tcl_list
  ```
  The software returns the following information:
  ```
  {m0/ck 100.0 100.0} {m1/ck 900.96 100.0}
  ```

report_ccopt_skew_groups

```
report_ccopt_skew_groups
[-help]
[-delay_corners {list_of_delay_corners} | -views {list_of_views}]
[-exclude_pin_insertion_delay]
[-exclude_source_latency]
[-file file_name]
[-from sources]
[-histograms]
[-include_voltage {on | off | auto} | -summary]
[-no_invalidate]
[-paths number_of_paths]
[-skew_groups list_of_skew_groups | -include_reporting_only_skew_groups]
[-skip_timing_update]
[-summarize_stage_depth cell_type_list]
[-tcl_list]
[-through list_of_pins]
[-to list_of_sinks]
[-early | -late ]
```

This command displays information about skew and insertion delay in skew groups. By default, the `report_ccopt_skew_groups` command displays two summary tables at the beginning of the report. The first table lists the insertion delays and skews (along with target values) for each skew group in each timing corner. The second table lists the start and end points of the min and max paths in the skew group. The remainder of the report contains detailed min and max path information for each skew group, in each timing corner.

You can customize the columns included in the skew group report by configuring `set_ccopt_property skew_group_report_columns`.

You can customize the size of the histogram ranges by configuring `set_ccopt_property skew_group_report_histogram_bin_size`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_skew_groups` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_ccopt_skew_groups`
`-delay_corners list_of_delay_corners`	
	Specifies that the report will be restricted to the specified delay corners. **Note**: The `-delay_corners` and `-views` parameters are mutually exclusive.
`-early`	Specifies that only the early half of the delay corners will be reported.
`-exclude_pin_insertion_delay`	
	Specifies that pin insertion delay should be excluded from the report.
`-exclude_source_latency`	Specifies that source latency of the clocks should be excluded from the report.

`-file` *file_name*	Specifies that a copy of the contents of the report will be saved to the specified file name.
`-from` *sources*	Specifies the list of sources of the skew group to consider for the report. If specified, only paths beginning at one of the sources specified will be reported.
`-histograms`	Specifies that histograms of key information will be displayed.
`-include_voltage {on | off | auto}`	Prints the voltage column. The following options are available: • `on`: always prints the extra voltage column • `off`: the extra voltage column is not printed • `auto`: only prints the extra voltage column when voltages are different **Note**: This parameter is mutually exclusive with the `-summary` parameter. This is because path delays are not displayed in the summary tables. *Default*: `auto`
`-include_reporting_only_skew_groups`	When specified, the report additionally includes the reporting-only skew groups. A reporting-only skew group is a skew group whose `constrains` property is set to `none`. Such a skew group imposes no clock balancing constraint and is not considered by CTS. By default, the reporting-only skew groups are not included in the report. If a reporting-only skew group is explicitly specified using the `-skew_groups` parameter, then that skew group is always included in the report output. **Note**: The `-include_reporting_only_skew_groups` and `-skew_groups` parameters are mutually exclusive. If both these parameters are specified together, the software errors out.
`-late`	Specifies that only the late half of the delay corners will be reported.
`-no_invalidate`	Specifies that the timing engine should not be invalidated. The timing engine is used to calculate the timing data that is displayed in the report. By default, this is invalidated when you generate the report, so all the timing data is recalculated. This increases the time taken to generate the report. Use the `-no_invalidate` option to reuse the existing timing data for the report.
`-paths` *number_of_paths*	Specifies the number of paths to report on for each timing corner. *Default*: `1`
`-skew_groups` *list_of_skew_groups*	
	Restricts the report to the specified skew groups. By default, all defined skew groups are displayed.
`-skip_timing_update`	Specifies that the timing engine should not be updated. The timing engine is used to calculate the timing data that is displayed in the report. By default, when you generate the report, the timing data is recalculated. This increases the time taken to generate the report. Specify this parameter to skip calculation of timing data.
`-summarize_stage_depth` *cell_type_list*	

	Specifies that the command will consider the number of cells of the specified type(s) in the tree, instead of considering delay while reporting. Possible values are buffer, inverter, logic, clock_gate, and generator. You can also specify `*` to include all cell types.
	The following command shows a report of the skew groups with counts of the buffers and inverters, instead of the delay.
	`report_ccopt_skew_groups -summarize_stage_depth {buffer inverter}`
	Note: The `*` setting is not used in combination with any other cell type. For example, the below is not a valid setting.
	`-summarize_stage_depth {* buffer}`

`-summary`	Specifies that just the summary table should be displayed in the report.
`-tcl_list`	Specifies that the report will be created as Tcl data instead of a text report.
`-through` *list_of_pins*	Provides a list of pin objects representing points that all # paths reported must pass through. The paths must pass through one of the pins specified.
`-to` *list_of_sinks*	Provides a list of pin objects representing all the sinks of skew groups to consider for the report. If specified, only paths terminating at one of the sinks specified will be reported.
`-views {`*list_of_views*`}`	Restricts the report to the delay corners associated with the specified views. **Note**: The `-delay_corners` and `-views` parameters are mutually exclusive.

Examples

Example1: Use the following command to display the skew group information as a summary table in the report:
`report_ccopt_skew_groups -summary`

```

-    max RESULTS_CONV_INST/r941_reg[15]/CP
                                     m_spi_clk/PM_HL_FUNC    0.301     -         0.303     -
```

Note:

- The “Timing Corner” column specifies the delay corner, timing check type (setup or hold) and derate type (early or late) reporting conditions for the skew group. All *early corners are reported using early clock derates and all *late corners are reported using late clock derates. A skew group row with no timing column specification is using the timing corner specified above it.
- The "Skew Target Type" column shows either "explicit", “auto computed” or “ignored”. Only the timing corner(s) with "explicit" or "auto computed" are actually considered during clock tree construction, and only these corners will have a numeric skew target in the “Target Skew” column. Generally, only timing corners with late derates for a delay corner are activated for clock tree construction.
- The "Skew window occupancy" column is defined as the percentage of sinks in the skew group that fall within the user-defined skew target. It is computed by finding a min and max latency window in which the largest proportion of sinks fall. The intent of this column is to indicate, when the skew target is not met, some measure of how badly it has not been met by showing the largest proportion of sinks that occupy the desired skew target.

Example2: Use the following command to shows a report of the skew groups with counts of the buffers and inverters, instead of the delay:

```
report_ccopt_skew_groups -summarize_stage_depth {buffer inverter} -skew_groups m_dsram_clk/PM_HL_FUNC

Timing for timing corner AV_HL_FUNC_MIN_RC1_dc:hold.late, max clock_path:

report_ccopt_worst_chain

```
report_ccopt_worst_chain
[-help]
[-check_type {setup | hold}]
[-file filename]
[-through pin | -through_file filename]
[-view viewname]
```

This command displays information about the worst chain, which is the chain that contains the path with the worst negative slack or WNS in the design. CCOpt is able to move slack between paths, so the fundamental timing constraint is not from one flop to the next, but chains of flop–to–flop paths. At each flop, timing can be shifted before or after the flop in order to make the physical optimization problem easier.

The command reports a chain as a series of nodes linked together by timing paths. Additionally, it contains information to let you determine how well the chain has been optimized. This report contains the following information:

- The timing chain containing the worst flop-to-flop path, which is identified in the report output by the string, "*WNS*"
- Timing path and constraint information to show why that WNS cannot be improved
- The path group name for each path

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_worst_chain` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_ccopt_worst_chain`
`-check_type setup | hold`	
	Specifies whether setup views or hold views are used for the report. *Default*: By default, only the worst chain for setup views is reported.
`-file filename`	Specifies that a copy of the contents of the report will be saved to the specified file name.
`-through pin`	Specifies the path through which the worst chain is being reported. When this parameter is specified, the chain containing the given pin or port is reported. The timing path which contains the `-through` pin is labelled with “*SEL*”. When this parameter is not specified, the chain with the WNS timing path is reported. The WNS timing path in the chain is labelled “*WNS*”.
`-through_file filename`	
	Creates a worst chain report for each pin or port in the specified file. **Note**: The parameters, `-through` and `-through_file` are mutually exclusive.
`-view viewname`	Specifies the view for which the worst chain is being reported.

Example

Following is an example of the report output:

```
report_ccopt_worst_chain

reset_all_ccopt_preserved_clock_tree_ports

```
  reset_all_ccopt_preserved_clock_tree_ports
[-help]
```

This command resets all preservation settings that have been specified using the `set_ccopt_preserved_clock_tree_port` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reset_all_ccopt_preserved_clock_tree_ports` parameter. For a detailed description of the command, use the man command: `man reset_all_ccopt_preserved_clock_tree_ports`

Example

- Use the following command to reset all the ports:
  ```
  reset_all_ccopt_preserved_clock_tree_ports
  ```

Related Commands

- `reset_ccopt_preserved_clock_tree_port`
- `report_ccopt_preserved_clock_tree_ports`
- `set_ccopt_preserved_clock_tree_port`

reset_ccopt_config

```
reset_ccopt_config
[-help]
[-preserve_sink_insertion_delays]
```

Resets the CCOpt configuration. The command functions in the same manner as the `delete_ccopt_clock_tree_spec` command, but also takes out all values set using the `set_ccopt_property` command. This command basically wipes out all CCOpt-specific data in Innovus. However, you can preserve the pin insertion delays on clock tree sinks by specifying the `-preserve_sink_insertion_delays` parameter.

Parameter

`-help`	Outputs a brief description of the `reset_ccopt_config` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reset_ccopt_config`
`-preserve_sink_insertion_delays`	When specified, preserves pin insertion delays currently configured on clock tree sinks.

Example

- The following command resets the CCOpt configuration:
  `reset_ccopt_config`

Related Commands

- `delete_ccopt_clock_tree_spec`
- `restore_ccopt_config`
- `save_ccopt_config`
- `set_ccopt_property`

reset_ccopt_preserved_clock_tree_port

```
  reset_ccopt_preserved_clock_tree_port
[-help]
{portname}
```

This command resets the preservation settings for the specified preserved port that have been specified using the `set_ccopt_preserved_clock_tree_port` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reset_ccopt_preserved_clock_tree_port` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reset_ccopt_preserved_clock_tree_port`
portname	Specifies the name of the port.

Example

- Use the following command to reset the port:
  ```
  reset_ccopt_preserved_clock_tree_port m1/ck
  ```

Related Commands

- `report_ccopt_preserved_clock_tree_ports`
- `reset_all_ccopt_preserved_clock_tree_ports`
- `set_ccopt_preserved_clock_tree_port`

reset_ccopt_routing_state

```
reset_ccopt_routing_state
[-help]
[-excluded {netname1 netname2.....}]
[-no_delete_routes]
[-reset_preroutes]
```

Resets the status of the CCOpt clock nets to "routed". The default behavior of the software is to then delete these nets, but you can specify the `-no_delete_routes` parameter to stop these nets from being deleted. The purpose of this command is to reset the routing state post NanoRoute, so that it can be rerun later using the `route_ccopt_clock_tree_nets` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reset_ccopt_routing_state` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reset_ccopt_routing_state`
`-excluded {netname1 netname2.....}`	Specifies the list of nets whose routing state is not to be reset.
`-no_delete_routes`	Specifies that the nets whose status is set to routed should not be deleted.
`-reset_preroutes`	When specified, resets the status of pre routes. By default, the pre-routes will be skipped.

Example

- The following command resets the routing state of clock nets without deleting them and excluding the specified net:

  ```
  reset_ccopt_routing_state -no_delete_routes -excluded {clock1111}
  ```

Related Command

- `route_ccopt_clock_tree_nets`

restore_ccopt_config

```
restore_ccopt_config
[-help]
input_path
```

Reads the CCOpt configuration from the specified directory path. The CCOpt configurations are saved using the `save_ccopt_config` command.

Note: The CCOpt configuration is not restored if the `restoreDesign -mmmcFile` option is set. In this case, the software issues the following warning:

```
**WARN: (IMPIMEX-4016): The saved CCOpt configuration will not be restored, as the -mmmcFile option has been set.
To restore the CCOpt configuration try restoring the design again without using the -mmmcFile option.
```

Parameters

`-help`	Outputs a brief description that includes type and default information for each `restore_ccopt_config` parameter. For a detailed description of the command and all of its parameters, use the man command: `man restore_ccopt_config`
`input_path`	Specifies the user-defined directory path from where to read the CCOpt configuration.

Examples

- Use the following command to write the configuration scripts to the `./az_ccopt dir`:
  ```
  save_ccopt_config ./az_ccopt
  ```
- Use the following command to clear the configuration:
  ```
  reset_ccopt_config
  ```
- Use the following command to restore the saved configuration by sourcing all the configuration scripts in the `./az_ccopt dir`:
  ```
  restore_ccopt_config ./az_ccopt
  ```

Related Commands

- `save_ccopt_config`
- `reset_ccopt_config`

route_ccopt_clock_tree_nets

```
route_ccopt_clock_tree_nets
[-help]
[-mesh]
```

Performs routing of CCOpt clock tree nets using the CCOpt route guides. Use this command after running `ccopt_design`.

CCOpt uses internal clock routes during the early stages of CTS. It then generates route guides that are passed to NanoRoute for final clock tree routing. This is done by default for full CTS runs. If, for some reason, you have disabled final clock tree routing in CCOpt, then this command can be used to complete the clock tree routing based on the CCOpt route guides. When the `-mesh` parameter is specified, the command only routes the mesh nets.

Note: Before running this command, ensure that the CCOpt data structures are in place.

Parameters

`-help`	Outputs a brief description for `route_ccopt_clock_tree_nets` parameter. For a detailed description of the command and all of its parameters, use the man command: `man route_ccopt_clock_tree_nets`
`-mesh`	Specifies that only mesh nets should be routed.

Related Commands

- `ccopt_design`
- `clock_opt_design`

route_ccopt_flexible_htrees

```
route_ccopt_flexible_htrees
[-help]
[nets net+]
```

Routes CCOpt flexible h-tree nets as a separate step after running the `synthesize_ccopt_flexible_htrees` command. The following use models are supported:

1. Routing during H-tree syntheses:
    a. `create_ccopt_flexible_htree`
    b. `synthesize_ccopt_flexible_htrees`
2. Routing after H-tree synthesis (block level)
    a. `create_ccopt_flexible_htree`
    b. `synthesize_ccopt_flexible_htrees -use_estimated_routes`
    c. `route_ccopt_flexible_htrees`

Note: When using this command, the software expects the input routes of nets in the flexible H-tree to be fully connected, as it is the case for routes generated by `synthesize_ccopt_flexible_htrees -use_estimated_routes`. If this expectation is not met, then unexpected results such as open nets may occur and you should check for connectivity-related warnings in the log file.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `route_ccopt_flexible_htrees` parameter. For a detailed description of the command and all of its parameters, use the man command: `man route_ccopt_flexible_htrees`
`-nets net+`	Specifies a list of flexible h-tree nets to route. The specified nets must all have been created by the `synthesize_ccopt_flexible_htrees` command. By default, the software automatically determines all the flexible h-tree nets that need to be routed.

Related Commands

- `create_ccopt_flexible_htree`
- `synthesize_ccopt_flexible_htrees`

Related Properties

You can also set the following properties on the flexible H-tree design objects by using the `set_ccopt_property` command:

- `adjust_sink_grid_for_aspect_ratio`
- `final_cell`
- `flexible_htree`
- `flexible_htree_placement_legalization_effort`

For detailed information about all public CCOpt properties, see the CCOpt Properties chapter in the *Innovus User Guide*. You can also use the following command:

```
get_ccopt_property -help propertyName
```

save_ccopt_config

```
save_ccopt_config
[-help]
output_path
```

Writes the CCOpt configuration to the specified directory.

Note: The content of the files generated using this command is proprietary. The files may not be in any particular format, or even human-readable, and are subject to change. The only supported use of the output of `save_ccopt_config` command is as input to the `restore_ccopt_config` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `save_ccopt_config` parameter. For a detailed description of the command and all of its parameters, use the man command: `man save_ccopt_config`
`output_path`	Specifies the user-defined directory to which the CCOpt configuration scripts will be saved.

Example

- The following command writes the CCOpt configuration scripts to the `./az_ccopt dir`:
  ```
  save_ccopt_config ./az_ccopt
  ```

Related Commands

- `restore_ccopt_config`
- `reset_ccopt_config`

set_ccopt_preserved_clock_tree_port

```
  set_ccopt_preserved_clock_tree_port
[-help]
{[portname [-location {x y}]]}
```

This command preserves module ports for the flexible h-tree feature. It can be used on any module port in the clock tree. It will preserve the specified module ports in both, clock tree synthesis and flexible h-tree synthesis. Any sinks connected downstream of the ports will remain downstream, and only those ports will be considered downstream.

Note: Currently, physical locations are only supported for flexible h-tree synthesis, and only on partition boundaries, although they will be accepted on all other module ports. Also, ports belonging to hInsts that have siblings but are not defined as partitions are not supported.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_ccopt_preserved_clock_tree_port` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_ccopt_preserved_clock_tree_port`
`-location`	Provides the location of the preserved port specified using the *portname* parameter.
portname	Specifies the name of the port.

Example

- Use the following command to mark a port on a partition boundary as preserved and set the location:
  ```
  set_ccopt_preserved_clock_tree_port m0/ck -location {100 100}
  ```

Related Commands

- report_ccopt_preserved_clock_tree_ports
- reset_all_ccopt_preserved_clock_tree_ports
- reset_ccopt_preserved_clock_tree_port

set_ccopt_property

```
set_ccopt_property
[-help]
name
value
[-cell library_cell_name]
[-clock_tree clock_tree_name]
[-clock_tree_source_group source_group_name]
[-delay_corner delay_corner_name]
[-flexible_htree flexibleHtreeName]
[-help propertyname]
[-inst instance_name]
[-lib_pin pin_name]
[-net net_name]
[-net_type leaf | trunk | top]
[-pin pin_name]
[-power_domain domain_name]
[-skew_group skew_group_name]
[-early | -late]
[-rise | -fall]
[-min | -max]
```

This command is used to set the values of various CCOpt object properties.

There are some properties that cannot be set by you because these are read-only properties. This means that you can obtain information about these properties by using the `get_ccopt_property` command, but you cannot change that information. However, there are writable properties that can be modified. These properties let you configure different aspects of CCOpt behavior. This command is used to set the writable CCOpt properties.

To set a property, you need to specify the property name, value, object type, and object pattern. The following syntax are acceptable:

1. `set_ccopt_property <name> <value> [-obj <obj_pattern>]`
2. `set_ccopt_property <name> [-obj  <obj_pattern>] <value>`
3. `set_ccopt_property [-obj <obj_pattern>] <name> <value>`

Where,

name is the name of the property to be set

value is the new value to which you want to set the property

For example, all three commands below are equivalent:

1. `set_ccopt_property target_skew 0.1 -skew_group sg1`
2. `set_ccopt_property target_skew -skew_group sg1  0.1`
3. `set_ccopt_property -skew_group sg1 target_skew 0.1`

For details about the key considerations for setting CCOpt properties, getting properties from Tcl, getting a list of properties and their detailed descriptions, key/value pairs, and defaults for key/value pairs, see the "CCOpt Properties and Configuration" section in the Clock Tree Synthesis chapter of the *Innovus User Guide*. For detailed descriptions about all the public CCOpt properties, see the CCOpt Properties chapter of the *Innovus User Guide*.

Parameters

`-help`	Outputs a brief description for the `set_ccopt_property` command. For a detailed description of the command, use the man command: `man set_ccopt_property`
`-cell` *`library_cell_name`*	Specifies the library cell to which the property applies.
`-clock_tree` *`clock_tree_name`*	Specifies the clock tree to which the property applies.
`-clock_tree_source_group` *`source_group_name`*	Specifies the clock tree source group to which the property applies.
`-delay_corner` *`delay_corner_name`*	Specifies the delay corner to which the property applies.
`-early`	Specifies that the property applies to the early signal.
`-fall`	Specifies that the property applies to the fall signal.
`-flexible_htree` *`flexibleHtreeName`*	Specifies the flexible H-tree to which the property applies.
`-help` *`propertyname`*	Provides help for the specified property. Other options are ignored.
`-inst` *`instance_name`*	Specifies the instance to which the property applies. This parameter enables properties to be added to instances.
`-late`	Specifies that the property applies to the late signal.
`-lib_pin` *`pin_name`*	Specifies the library pin to which the property applies.
`-max`	Specifies the maximum value for the property.
`-min`	Specifies the minimum value for the property.
`name`	Specifies the name of the property to be set.
`-net` *`net_name`*	Specifies the net level to which the property applies.
`-net_type` *`leaf	trunk	top`*	Specifies the net type to which the property applies. It could be leaf net, trunk net, or top net.
`-pin` *`pin_name`*	Specifies the pin to which the property applies.
`-power_domain` *`domain_name`*	Specifies the power domain to which the property applies.
`-rise`	Specifies that the property applies to the rise signal.
`-skew_group` *`skew_group_name`*	Specifies the skew group to which the property applies.
`value`	Specifies the new value to which to set the property.

Examples

- The following commands will cause all ‘trunk’ type clock tree nets to be routed using route_type ‘`CTS_2w2s`’ and all ‘leaf’ type clock tree nets to be routed using route_type ‘`CTS_1w2s`’:

  ```
  set_ccopt_property route_type -net_type trunk CTS_2w2s
  set_ccopt_property route_type -net_type leaf CTS_1w2s
  ```

- The following command will cause all ‘trunk’ clock tree nets for clock trees matching pattern “`MAIN`*” to be routed with route_type ‘`NDR_xtra_wide`’:

  ```
  set_ccopt_property route_type -net_type trunk -clock_tree MAIN* NDR_xtra_wide
  ```

- The following command sets the net type to `leaf`:

  ```
  set_ccopt_property -net_type leaf
  ```

- The example below specifies that clock tree synthesis should use inverters when balancing clock tree ct1:

  ```
  set_ccopt_property use_inverters -clock_tree ct1 true
  ```

- Some properties are global, and others are specific to a particular object. Some examples are provided below.
  - The `adjacent_rows_legal` property is global. This means that you can set this property using the following command:

    ```
    set_ccopt_property adjacent_rows_legal true/false
    ```

  - Some properties can be set on particular objects. For example, minimum number of transitive fanout for a net to be routed as a top net can be set for a clock tree:

    ```
    set_ccopt_property -clock_tree clk500m routing_top_min_fanout 10000
    ```

  - Some other properties can be set per object AND per early/late path. For example, the `insertion_delay` property can be set in the following manner:

    ```
    set_ccopt_property insertion_delay 0.8 -pin pinA -early
    set_ccopt_property insertion_delay 0.7 -pin pinA -late
    ```

Related Information

- `get_ccopt_property`
- `unset_ccopt_property`
- For details about the key considerations for setting CCOpt properties, getting properties from Tcl, getting a list of properties and their detailed descriptions, key/value pairs, and defaults for key/value pairs, see The CCOpt Property System topic in the *Innovus User Guide*.

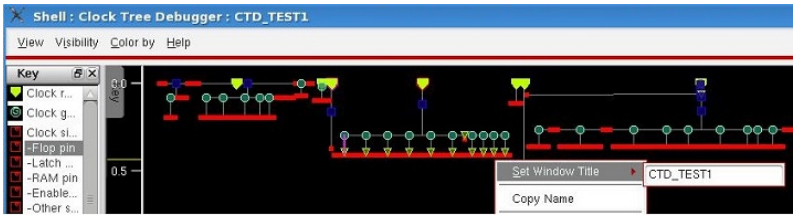
set_ctd_win_title

```
set_ctd_win_title
[-help]
title
[-id WindowIDName]
```

Specifies the title of the CTD window. By default, this command is used to set the title of the current active CTD window either if a unique ID has not been specified for this window or if you want to change the existing window ID.

You can also set the window title from the context menu of the Clock Tree Viewer in the CTD. Click Set Window Title, type the title for the CTD session, and press enter. The new title appears in the top bar of the CTD. This is shown in below image.



Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_ctd_win_title` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_ctd_win_title`
`-id` *`WindowIDName`*	Specifies the ID of the window whose title is to be set. If there are several CTD windows open in the current session, with window IDs, `user_id1, user_id3, user_id3`, and so on, with corresponding window titles, `title1, title2, title3`, and so on, then the following command will only change the `title1` of window with ID, `user_id1`, to `my_new_title`. `set_ctd_win_title my_new_title -id user_id1`
`title`	Specifies the title to be given to the specified window. This parameter is required.

Examples

- The following command sets the window title of the current CTD window, `my_title`, to `my_new_title`:

  ```
  set_ctd_win_title my_new_title
  ```

  The active CTD window title will be changed from:

  ```
  my_test.tcl : Clock Tree Debugger : my_title
  ```

  to:

  ```
  my_test.tcl : Clock Tree Debugger : my_new_title
  ```

- The following command retrieves the window IDs of CTD windows, with a mapping of their window titles:

  ```
  get_ctd_win_id -detail
  ```

  ```
  user_id2 : Clock Tree Debugger : title2
  ```

where, `user_id2` is the window ID, Clock Tree Debugger is the window type, and title2 is the mapping title for this window.

show_ccopt_cell_name_info

```
show_ccopt_cell_name_info
[-help]
```

Returns the list of cell name codes. All new cell instances created by CCOpt have an identifying code in their name to let you determine why that cell was created. This command lists all available codes and their meanings.

Parameters

`-help`	Outputs a brief description for the `show_ccopt_cell_name_info` parameter. For a detailed description of the command, use the man command: `man show_ccopt_cell_name_info`

Example

- The following command returns a list of all available codes and their meanings:

```
show_ccopt_cell_name_info

Creators:
CTSG Unnamed - this should not be used any more.
cuk Cts: Unknown creator, will not appear in the netlist.
ccl_a Cts: Created during clustering by the agglom clustering algorithm.
cbi Cts: Created by the swapping buffers and inverters for power.
cex Cts: Existing cells in the clock tree which cannot be removed.
coi Cts: Cells created as a result of cancelling out inversions
lbl Cts: Created by the clustering process to meet the slew target
ccl Cts: Created by the clustering process to meet the slew target
ccd Cts: Created by clustering for balancing the tree - these cells are not necessary to meet the slew
target.
cci Cts: Created by the clustering process to fix inversion.
csf Cts: Created by the CTS slew fixing step in cases where clustering did not meet the slew target.
cms Cts: Created during the process of physically moving clock gates to improve their enable timing.
cid Cts: Created by CTS on the outputs of weak driving cells to reduce insertion delay.
cdb Cts: Created by CTS to balance the delays in the clock tree.
cdbw Cts: Created by CTS to balance the delays in the clock tree.
cwb Cts: Created by CTS to balance the wire delays in the clock tree.
cfo Cts: Created by CTS to reduce fanout skew.
csk Cts: Created by the CTS skew fixing step to finely balance the clock tree.
cmf Cts: Created by CTS to buffer long nets.
cbc Cts: Created by the clock tree conditioning step to clone off sub trees that cannot optimized by gated
synthesis, such as those parts above RAMs, black boxes, and lockup latches.
css Cts: Created by the early cloning of simple sink allocations.
cdc Cts: A clock driver created by adding driver cell process for property add_driver_cell.
cpd Cts: A clock driver created below an input port or above an output port specified by property
add_port_driver.
ccg Cts: A clock gate created by one of the gated synthesis algorithms.
cse Cts: A clock driver created above exclude pins to remove them from the clock tree.
cfh Cts: A clock driver created as part of a flexible H-tree.
cat Cts: Created by the add_clock_tree_source_group_roots command
cpc_drv Cts: A clock driver created by post conditioning.
cpc_sk Cts: A clock driver created by post conditioning.
PRO Post-route optimization.
PRO_drv Post-route optimization.
PRO_sk Post-route optimization.
sfc Cloned by slew fixing.
ccc Cts: Created by the clone_clock_cells command.
grb Cts: A clock driver created by global route buffering.
sgb Cts: A clock driver created by source group balancing.
idc Cloned to reduce insertion delay
vgb Cts: A clock driver created by VG buffering.
USK skewClock
cff Cts: A clock driver created by fanout fixing.
```

synthesize_ccopt_flexible_htrees

```
synthesize_ccopt_flexible_htrees
[-help]
[-block_master_clone]
[-dry_run]
[-spec_file fileName]
[-use_estimated_routes | -trial_mode {true | false | placement_only | routing_only}]
```

This command is used to synthesize all flexible H-trees that have been created but not previously synthesized, in one go. The flexible H-trees are created using the `create_ccopt_flexible_htree` command. The `synthesize_ccopt_flexible_htrees` command helps reduce the runtime by synthesizing all flexible H-trees in one go as compared to if the flexible H-trees were synthesized one at a time. This is because when you use this command, nanoRoute is called only once to route all flexible H-trees at the same time.

Note: You must run the `synthesize_ccopt_flexible_htrees` command to synthesize any flexible H-trees previously created using the `create_ccopt_flexible_htree` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `synthesize_ccopt_flexible_htrees` parameter. For a detailed description of the command and all of its parameters, use the man command: `man synthesize_ccopt_flexible_htrees`
`-block_master_clone`	When specified, blocks master/clone partitions for H-tree instances and nets. If this parameter is not specified, and the master/clone partitions do not contain H-tree sink pins, then the software will error out with the following error: `**ERROR: (IMPCCOPT-1506): Flexible H-tree 'htree' uses a sink grid, which is not supported on master/clone designs unless master/clone partitions are blocked during flexible H-tree synthesis. If applicable, master/clone partitions can be blocked using synthesize_ccopt_flexible_htrees -block_master_clone.`
`-dry_run`	Runs the synthesis algorithm but do not insert the H-tree into the database.
`-spec_file` *fileName*	Specifies the name of the clock tree specification script file. When the file name is specified, the clock tree specification file is not amended to reflect the new state of the clock tree. Instead, the amendments, which are in the form of Tcl commands, are written to the file specified using this parameter.
`-trial_mode {true | false | placement_only | routing_only}`	When set, enables trial routing and placement mode for flexible H-tree synthesis. The following settings are available: `true`: Run routing and detailed placement in trial mode. `false`: Run neither routing nor detailed placement in trial mode. This is the default setting. `placement_only`: Only run detailed placement in trial mode. `routing_only` : Only run routing in trial mode. **Note**: The `-trial_mode` and `-use_estimated_routes` parameters are mutually exclusive. *Default*: `false`
`-use_estimated_routes`	Specifies that NanoRoute should not be called. So, the routing estimates are left in the netlist. **Note**: The `-trial_mode` and `-use_estimated_routes` parameters are mutually exclusive.

Example

- The following set of commands are used to synthesize a flexible H-tree under the pins "`rootC/Y`". The sinks will be of the type `INVX9` and will be placed in the specified sink grid. Other buffers added to the H-tree will be of type `INVX13`. The flexible H-tree is then synthesized using the `synthesize_ccopt_flexible_htrees` command.

```
create_ccopt_flexible_htree -name htreeC -sink_grid {6 6} -final_cell INVX9 -trunk_cell INVX13 -pin
rootC/Y
synthesize_ccopt_flexible_htrees
```

Related Information

unset_ccopt_property

```
unset_ccopt_property
[-help]
name
[-cell library_cell_name]
[-clock_tree clock_tree_name]
[-clock_tree_source_group source_group_name]
[-delay_corner delay_corner_name]
[-flexible_htree flexibleHtreeName]
[-help property_name]
[-inst instance_name]
[-lib_pin pin_name]
[-net net_name]
[-net_type leaf | trunk | top]
[-pin pin_name]
[-power_domain domain_name]
[-skew_group skew_group_name]
[-early | -late]
[-rise | -fall]
[-min | -max]
```

This command is used to reset the CCOpt object properties to their default values.

The `-help` parameter of the command when used with the property name is used to retrieve detailed help on the property (`unset_ccopt_property property_name -help`). For example, run the following command to view detailed help on the `use_inverters` property:

```
unset_ccopt_property use_inverters -help
```

The software displays the following information:

```
Specifies whether clock tree synthesis should prefer to use inverters rather
than buffers when balancing the clock tree. If set to true, CTS will use
inverters for the clock tree balancing process. If set to false, CTS will use
the minimum number of levels of inverters required to maintain logical
correctness. If set to auto (the default) CTS will use what it considers to be
the best combination of buffers and inverters to get optimal quality of
results.
```

Default: `auto`

Valid values: `auto true false`

Applies to: `Global, clock_tree`

Note: For detailed description of all public CCOpt properties, see the CCOpt Properties chapter in the *Innovus User Guide.*

Parameters

`-help`	Outputs a brief description for the `unset_ccopt_property` command. For a detailed description of the command, use the man command: `man unset_ccopt_property`
`-cell` *`library_cell_name`*	Specifies the library cell to which the property applies.

`-clock_tree` *clock_tree_name*	
	Specifies the clock tree to which the property applies.
`-clock_tree_source_group` *source_group_name*	
	Specifies the clock tree source group to which the property applies.
`-delay_corner` *delay_corner_name*	
	Specifies the delay corner to which the property applies.
`-early`	Specifies that the property applies to the early signal.
`-fall`	Specifies that the property applies to the fall signal.
`-flexible_htree` *flexibleHtreeName*	
	Specifies the flexible H-tree to which the property applies.
`-help` *property_name*	Provides help for the specified property. All other options are ignored.
`-inst` *instance_name*	Specifies the instance to which the property applies. This parameter enables properties to be added to instances.
`-late`	Specifies that the property applies to the late signal.
`-lib_pin` *pin_name*	Specifies the library pin to which the property applies.
`-max`	Specifies the maximum value for the property.
`-min`	Specifies the minimum value for the property.
name	Specifies the name of the property to unset.
`-net` *net_name*	Specifies the net level to which the property applies.
`-net_type` *leaf | trunk | top*	
	Specifies the net type to which the property applies. It could be leaf net, trunk net, or top net.
`-pin` *pin_name*	Specifies the pin to which the property applies.
`-power_domain` *domain_name*	
	Specifies the power domain to which the property applies.
`-rise`	Specifies that the property applies to the rise signal.
`-skew_group` *skew_group_name*	Specifies the skew group to which the property applies.

Examples

- Use the following command to return the default value of the post_conditioning property:
  ```
  get_ccopt_property post_conditioning
  ```
  The software returns the following information:
  ```
  1
  ```
- Use the following command to set the property to the new value:
  ```
  set_ccopt_property post_conditioning 0
  ```
- Use the following command to check the new value of this property:
  ```
  get_ccopt_property post_conditioning
  ```
  The software returns the following information:
  ```
  0
  ```
- Use the following command to unset the property:
  ```
  unset_ccopt_property post_conditioning
  ```
- Use the following command to check the value of this property now:
  ```
  get_ccopt_property post_conditioning
  ```
  The software returns the following information:
  ```
  1
  ```

Related Information

- `get_ccopt_property`
- `set_ccopt_property`
- For details about the key considerations for setting CCOpt properties, getting properties from Tcl, getting a list of properties and their detailed descriptions, key/value pairs, and defaults for key/value pairs, see the The CCOpt Property System in the *Innovus User Guide*.

update_ccopt_clock_tree

```
update_ccopt_clock_tree
[-help]
clock_tree
[-generated_by sink_pins]
```

Updates the specified clock tree. This command converts a normal (non-generated) clock tree into a generated clock tree. It is intended for internal use only, and should never be required in a CCOpt flow, because the `create_ccopt_clock_tree_spec` command issues `create_ccopt_clock_tree` and `create_ccopt_generated_clock_tree` commands in the correct order to ensure that the right type of clock trees are created. This command is only required when you are translating a legacy FE-CTS clock tree specification for use with CCOpt, which is done using the `-ckSpec` option of the `ccopt_design` command. This is because, in this case, the legacy FE-CTS clock specification may be in a different order than that required by CCOpt.

This command can be seen in the output of `ccopt_design -ckspec -cts -genScriptOnly filename`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `update_ccopt_clock_tree` parameter. For a detailed description of the command and all of its parameters, use the man command: `man update_ccopt_clock_tree`
`clock_tree`	Specifies the name of the clock tree to update. This parameter is required.
`-generated_by` *`sink_pins`*	Specifies the sink pins in the parent clock trees from which this clock tree is generated.

Example

- The following command updates the specified clock tree:
  ```
  update_ccopt_clock_tree m_clk
  ```

Related Commands

- `ccopt_design`
- `clock_opt_design`
- `delete_ccopt_clock_trees`
- `get_ccopt_clock_trees`
- `report_ccopt_clock_trees`

update_clock_latencies

```
update_clock_latencies
[-help]
```

Updates the IO latencies for clock sinks specified using the `consider_during_latency_update` property. You can set the following values for this property:

```
set_ccopt_property consider_during_latency_update true | auto | false
```

- `true`: Consider this pin during latency update.
- `auto`: Consider this pin during latency update only if it is an active sink of a non-reporting only sink group. This is the default value.
- `false`: Do not consider this pin during latency update. This setting is appropriate for sinks that have a large user pin insertion delay applied.

When the above property is set, use the `update_clock_latencies` command to update the IO latencies.

Parameters

`-help`	Outputs a brief description of the `update_clock_latencies` command. For a detailed description of the command, use the man command: `man update_clock_latencies`

Related Information

The following property:

- `consider_during_latency_update`

For details, see the CCOpt Properties chapter in the *Innovus User Guide*.

You can also use the following command:

`get_ccopt_property -help` *`propertyName`*

update_clock_tree_source_latency

```
update_clock_tree_source_latency
[-help]
-clock_tree_source_groups source_group_list
```

Stores clock arrival and transition times at the clock tree source group roots in preparation for multi-tap CTS.

This command may be helpful for configuring arrival times for clock structures in which a mesh drives the source group roots. With other structures such as H-tree, which have a single driver per net, the source group roots are usually defined as generated clock trees and CTS will automatically propagate the clock arrival times from the clock source, through the drive structure, up to the inputs of the source group roots. Flexible H-tree synthesis takes care of all this automatically. However for mesh applications, the CTS clock specification, clock trees defined by the `create_ccopt_clock_tree` and `create_ccopt_generated_clock_tree` commands, cannot include nets with multiple drivers, so CTS cannot automatically propagate arrival times through the clock mesh. For these structures, the source group is typically defined as a collection of non-generated clock trees, and the arrival times are explicitly annotated at their roots before the start of CTS.

This command simplifies the process by querying the timing engine for arrivals and transitions and setting the `source_latency` and `source_input_max_trans` properties at the roots of the specified source group or groups.

Note: The `update_clock_tree_source_latency` command queries the timing graph to get arrival times and transitions. If timing is not already available, the command will first perform a timing graph update, which may take some time. Also, the command assumes that for a particular source group there is a single common clock phase present at all roots. If there is no common clock phase at all roots, or if there are multiple common clocks phases, the command will issue an error message and quit. Also, if a specified source group includes any generated clock trees, the command will issue an error message and quit.

Parameters

`-help`	Outputs a brief description of the `update_clock_tree_source_latency` command. For a detailed description of the command, use the man command: `man update_clock_tree_source_latency`
`-clock_tree_source_groups source_group_list`	
	The list of clock tree source groups for whose clock roots the latencies will be stored. This parameter is required to be specified.

Example

The following command updates the latencies for a single source group, `four_taps`. In this case, timing is already available and no timing graph update is required.

```
update_clock_tree_source_latency -clock_tree_source_groups four_taps

Updating clock tree source latencies for source group 'four_taps'.

Found common clock 'clock' at all source group roots.

Set source timing for 4 roots of source group 'four taps'.

dly_abc_worst:

latency: late rise: [0.565ns, 0.602ns], late fall: [0.816ns, 0.852ns], early rise: 0.000ns, early fall: 0.000ns
transition: late: [0.119ns, 0.120ns], early: [0.119ns, 0.120ns]
```

Related Information

- `create_ccopt_clock_tree`
- `create_ccopt_generated_clock_tree`
- The following properties:
  - `source_latency`
  - `source_input_max_trans`

  For detailed information about the above properties, see the CCOpt Properties chapter in the *Innovus User Guide*. You can also view the property help by running the following command:
  `get_ccopt_property -help property name`

update_clock_tree_spec_annotations

```
update_clock_tree_spec_annotations
[-help]
[-file file_name]
```

Updates all ideal nets, transition and delay annotations to match active timing constraints and removes all prior annotations from the clock tree specification. When this command is specified, all prior annotations are removed from the clock tree specification and the `set_annotated_transition` and `set_annotated_delay` values are mapped to the `annotated_transition` and `annotated_delay_to` property settings. The updated settings can be written to a file using the `-file` option or they can be applied immediately.

The following properties are provided to model the data captured by `set_ideal_network`, `set_annotated_delay`, `set_annotated_transition`, `set_ideal_latency` and `set_ideal_transition`:

- **ideal_net**

  If set the clock tree timing engine will consider this net as ideal.

  Default: `false`
  Required argument: `net`

- **annotated_delay_to**

  Overrides any clock tree timing engine-computed cell arc or net arc delays to the specified pin, in a manner similar to that of SDC set_annotated_delay command.

  For **cell arcs**: The format is dict where the keys are pins and the values are a rise fall delay pair. For example:

  ```
  "<from pin 1> {<from rise delay 1> <from fall delay 1>} <from pin 2> {<from rise delay 1> <from fall delay 2>}"
  ```

  For **net arcs**: The format is dict where the keys are pins and the values are the delay. For example:

  ```
  "<from pin 1> <delay 1> <from pin 2> <delay 2>}"
  ```

  For convenience, set the property using a single value that will apply to all available delays from pins and rise/fall from edges. For example, "0.100".

  Default: `""`

  Applicable arguments: `"-delay_corner <name>", "-pin <name>", "-early", "-late", "-rise" and "-fall". Required: "-pin <name>".`

- **annotated_transition**

  Overrides any clock tree timing engine-computed transition at the specified pin, in a manner similar to that of SDC `set_annotated_transition` command.

  Default: `auto`

  Applicable arguments: `"-delay_corner <name>", "-pin <name>", "-early", "-late", "-rise" and "-fall". Required: "-pin <name>".`

Parameters

`-help`	Outputs a brief description of the `update_clock_tree_spec_annotations` command. For a detailed description of the command, use the man command: `man update_clock_tree_spec_annotations`.
`-file` *`file_name`*	Writes commands to the specified file instead of applying the changes in memory.

Example

Use the set of commands listed below to define a transition annotation at `pin b1/I`, delay annotation at `net_b1`, update the annotations from CTE to clock tree timing engine (CTTE), and verify that the annotation is corrected applied at clock tree timing engine (CTTE).

```
set_interactive_constraint_modes [all_constraint_modes]
set_propagated_clock [all_clocks]

create_ccopt_clock_tree -name clk -source clk -no_skew_group
create_ccopt_skew_group -name clk/default_constraint_mode -sources clk -auto_sinks
```

Annotate transition at b1/I pin using the below command:

```
set_annotated_transition 1.234 [get_pins {b1/I}]
```

Annotate delay at net_b1 net using the below command:

```
set_annotated_delay 2.345 -net -from [get_pins {b1/Z}] -to [get_pins {b2_2/I}]
```

Update the annotations from CTE to CTTE using the below command:

```
update_clock_tree_spec_annotations
```

The log shows the following information:

```
<CMD> update_clock_tree_spec_annotations

Conformal Commands

- runCLP

runCLP

```
runCLP
[-cpf fileName]
[-cmd cmdFile]
[-extraLib lib …]
[-extraVlog fileName …]
[-post_synthesis]
[-setupOnly]
[-useEEQCellWithLibertyInfo]
[-user_config ConfigurationFile]
```

Verifies the current design with the power intent file (CPF and 1801) using Conformal Low Power (CLP).

To use this command, specify the path to the CLP (lec) installation before running the Innovus software, and the CLP license is also required. You can use this command after loading a design.

By default, Innovus software generates the following files, then runs CLP

- Netlist (clp_input/feclp.v)
- CPF/1801 file (feclp.cpf or feclp.upf)
- dofile (clp_input/feclp.tcl)

Parameters

`-extraLib` *lib …*	Specifies a list of extra libraries. *Data_type*: string, optional
`-extraVlog` *fileName …*	Specifies a list of extra Verilog files. *Data_type*: string, optional
`-cpf` *fileName*	Specifies the CPF file to use as input to the verification tool. *Default:* `./feclp.cpf`, generated by the Innovus software. *Data_type*: string, optional
`-cmd` *cmdFile*	Specifies the Tcl file to use as input to the verification tool. *Default*: `./clp_input/feclp.tcl`, generated by the Innovus software. *Data_type*: string, optional
`-post_synthesis`	Supports the post_synthesis mode. *Data_type*: bool, optional
`-setupOnly`	Generates input files, but does not run the verification tool. *Data_type*: bool, optional
`-useEEQCellWithLibertyInfo`	Uses an EEQ cell with timing library definition as the master cell of a leaf instance. *Data_type*: bool, optional
`-user_config` *ConfigurationFile*	Specifies the user configuration file. *Data_type*: string, optional

Delay Calculation Commands and Global Variables

- Delay Calculation Commands
- Delay Calculation Global Variables

Delay Calculation Commands

- addDeCap
- addDeCapCellCandidates
- cleanupExcludeNet
- clearDeCapCellCandidates
- deleteDeCap
- getDelayCalMode
- reportDeCap
- reportDeCapCellCandidates
- reportDelayCalculation
- saveExcludeNet
- saveSignalStormConstraint
- setDelayCalMode
- translateSNDCSetupFile
- writeSetLoad

addDeCap

```
addDeCap
[-help]
-totCap total_cap_in_fF
[-cells cellName]
[-addFixAttr]
[-area x1 y1 x2 y2 | -exclude {{x1 y1 x2 y2} ...}]
[-effort [low | high]]
[-prefix prefixName]
[-noFixDRC]
[-log logName]
[-maxNrIter number]
[-fromFile fileName]
[-pgNet netName]
```

Adds the specified total decoupling capacitance to the design. The software chooses from the available decoupling capacitance cell candidates, and adds enough cells until their combined total capacitance value equals the user-specified value.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `addDeCap` parameter. For a detailed description of the command and all of its parameters, use the man command: `man addDeCap`.
`-addFixAttr`	Specifies that the decap cell being placed is Fixed. Use this parameter after inserting decoupling capacitance.
`-area x1 y1 x2 y2`	Defines an area within the design in which to add the decoupling capacitance. *Default:* Entire design area x1: Specifies the area's lower left point on the x axis. y1: Specifies the area's lower left point on the y axis. x2: Specifies the area's upper right point on the x axis. y2: Specifies the area's upper right point on the y axis.

`-cells` *cellName …*	Specifies the cells to use for decoupling capacitance insertion. The specified cells must first be defined using the `addDeCapCellCandidates` command. *Default:* Any cell previously defined with the `addDeCapCellCandidates` command. **Note**: The `-cells` parameter is order dependent.
`-effort [low | high]`	Specifies the approach to use when inserting decoupling capacitance. *Default:* `low` Specify one of the following: Uses a homogeneous approach to add the decoupling capacitance. That is, the software treats all areas the same when adding decoupling capacitance cells. Analyzes the peak current of the instances and tries to add more cells to the areas with high peak current density.
`-exclude {`*x1 y1 x2 y2*`} …`	Defines a blockage area within which decoupling capacitance cannot be inserted. You can specify one or more blockage areas. **Note:** The parameters `-exclude` and `-area` are mutually exclusive. When both parameters are specified on the command line, the tool throws an error.
`-noFixDRC`	Disables correction of DRC errors.
`-fromFile` *fileName*	Performs decoupling capacitance insertion using the information in the specified log file (created from a previous `addDeCap` session). This file can contain information for adding decoupling capacitance cells and for deleting existing decoupling capacitance cells.

`-log` *logName*	Outputs a log file with the specified name that contains information on where the decoupling capacitance cells were added. It can also contain information on where cells were deleted due to DRC violations. The log file can be used for tracking the location of decoupling capacitance and for debugging purposes. It can also be used to insert decoupling capacitance cells in a different session. The log file is output in the following format: `ADD` *cellName locationX locationY* [*orientation*] [*instanceName*] `DEL` *instanceName* It contains the cell name and the location where an instance of it was placed. It can also contain the orientation of the instance, and a name for the instance, if that name has not been used already. For example, the following line shows that a new instance of `CELL_8` with the name `Instance100` was added at the location 100 200, with an orientation of R0: `ADD CELL_8 100 200 R0 Instance100`
`-maxNrIter` *number*	Specifies the iteration for inserting decap if there is DRC. *Default*: 10
`-prefix` *prefixName*	Defines the prefix to use for the decoupling capacitance cells. *Default:* `DECAP`
`-pgNet` *netName*	Adds decap cells on the specified power rail. *Default:* Add decap cells irrespective of power nets.
`-totCap` *total_cap_in_fF*	Specifies the total decoupling capacitance to add to the design, in femtofarads (fF). The software uses the specified decoupling cell candidates and adds cells until their combined capacitance value equals *capacitance*.

Command Order

Use this command after defining decoupling capacitance cell candidates with the `addDecapCellCandidates` command.

Examples

- The following command adds 1000 fF of capacitance to the design using `DECAP10` and `DECAP8` cells, in that order:

  ```
  addDeCap -totCap 1000 -cells DECAP10 DECAP8
  ```

- The following command adds 6367.341 fF of capacitance to the specified area within the design, and marks the placement status of all instances as `Fixed`:

  ```
  addDeCap -totCap 6367.341 -area 600 600 900 900 -addFixAttr
  ```

Related Information

Related Information

- `deleteDeCap`
- `reportDeCap`

addDeCapCellCandidates

```
addDeCapCellCandidates
[-help]
{cellName capacitance | -fromFile fileName}
```

Defines the cells that can be used by the `addDeCap` command to insert decoupling capacitance into the design. Use this command to define the candidate cells before using the `addDeCap` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `addDeCapCellCandidates` parameter. For a detailed description of the command and all of its parameters, use the man command: man `addDeCapCellCandidates`.
`cellName capacitance`	Specifies the name and capacitance value in femtofarads (fF) for the cell candidate.
`-fromFile` *`fileName`*	Defines the cells and capacitance values contained in the specified file as decoupling capacitance cell candidates.

Example

The following commands define two decoupling capacitance cell candidates: `DECAP10` has a capacitance value of 10fF, and `DECAP8` has a capacitance value of 5fF.

```
addDeCapCellCandidates DECAP10 10
addDeCapCellCandidates DECAP8 5
```

Related Information

  - Adding Decoupling Capacitance
- `addDeCapCellCandidates`
- `clearDeCapCellCandidates`
- `reportDeCapCellCandidates`

cleanupExcludeNet

```
cleanupExcludeNet [-help]
```

Clears excluded net settings that were specified with the delaycal_exclude_net global variable. Any nets that were previously excluded from delay calculation using the `delaycal_exclude_net` variable are now included in delay calculation. You do not have to rebuild the timing graph to include the previously-excluded nets. Use this command after specifying the nets that are to be excluded from delay calculation.

Parameter

`-help`	Outputs a brief description of the `cleanupExcludeNet` command. For a detailed description of the command, use the man command: `man cleanupExcludeNet`.

Example

The following command clears excluded nets such that previously excluded nets are now included again in delay calculation:

```
cleanupExcludeNet
```

clearDeCapCellCandidates

```
clearDeCapCellCandidates
[-help]
```

Clears all available cells for decoupling capacitance insertion. You can use this command to clear previously defined decoupling cell candidates specified using the addDeCapCellCandidates command.

Parameter

`-help`	Outputs a brief description of the `clearDeCapCellCandidates` command. For a detailed description of the command, use the man command: man `clearDeCapCellCandidates`.

Example:

The following command clears all available decoupling cell candidates:

```
clearDeCapCellCandidates
```

Related Information

- Placing the Design chapter in the *Innovus System User Guide*
  - Adding Decoupling Capacitance
- `addDeCapCellCandidates`
- `reportDeCapCellCandidates`

deleteDeCap

```
deleteDeCap
[-help]
```

Deletes all decoupling capacitance cells. You can use this command to delete decoupling capacitance cells that you added using the addDeCap command.

Parameter

`-help`	Outputs a brief description of the `deleteDeCap` command. For a detailed description of the command, use the man command: `man deleteDeCap`.

Example

The following command deletes all of the decoupling capacitance cells in a design:

```
deleteDeCap
```

Related Information

- Placing the Design chapter in the *Innovus System User Guide*
  - Adding Decoupling Capacitance
- `addDeCap`
- `reportDeCap`

getDelayCalMode

```
getDelayCalMode
{-help]
[-combine_mmmc]
[-enable_high_fanout]
[-enable_low_memory_mode]
[-enable_quiet_receivers_for_hold]
[-equivalent_waveform_model]
[-ewm_type]
[-honorSlewPropConstraint]
[-ignoreNetLoad]
[-pessimistic_base_timing]
[-reportOutBound]
[-SIAware]
[-slewOutBoundLimitHigh]
[-slewOutBoundLimitLow]
[-socv_accuracy_mode]
[-socv_lvf_mode]
[-socv_use_lvf_tables]
[-quiet]
[-nonDefault]
```

Returns the current settings of the `setDelayCalMode` command. The following information is displayed:

- Parameter name
- Current value of the parameter
- Type (Boolean, string, and so on)
- Information on whether the parameter value is user-defined or default.

If you do not specify any parameter, the software displays current settings of all the `setDelayCalMode` command parameters.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setDelayCalMode` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man getDelayCalMode`.
`parameter_names`	Displays information for the specified parameters. See `setDelayCalMode` command for descriptions of the parameters that you can specify.
`-quiet`	Displays the current settings of the specified parameters in Tcl list format. If you specify `-quiet` without any other parameters, the software displays the current settings of all the `setDelayCalMode` parameters in Tcl list format.

Examples

- The following command displays the current settings of the `setDelayCalMode -combine_mmmc` parameter:
  ```
  getDelayCalMode -combine_mmmc
  ```
  The following information is displayed:
  ```
  -combine_mmmc early_late # enums={none early_late}, default=early_late
  early_late
  ```
- The following command displays the current settings of all the `setDelayCalMode` parameters:
  ```
  getDelayCalMode -quiet
  ```

Related Commands

- `setDelayCalMode`
- `reportDelayCalculation`
- `report_timing`

Related Information

- "Base Delay Analysis" chapter in the *Innovus System User Guide*

reportDeCap

```
reportDeCap
[-help]
-area x1 y1 x2 y2
```

Reports placed decoupling capacitance cells in the specified area.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reportDeCap` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reportDeCap`.
`-area x1 y1 x2 y2`	Defines the area for which to report placed decoupling capacitance cells.

Example

The following command reports placed decoupling capacitance cells in the specified area:

```
reportDeCap -area 250 250 1000 1000
```

Related Information

- Placing the Design chapter in the *Innovus User Guide*
  - Adding Decoupling Capacitance
- `addDeCap`
- `deleteDeCap`

reportDeCapCellCandidates

```
reportDeCapCellCandidates
[-help]
[-file outputFileName]
```

Reports the available cells for decoupling capacitance insertion. You use this command to report decoupling capacitance candidates previously specified using the addDeCapCellCandidates command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reportDeCapCellCandidates` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reportDeCapCellCandidates`.
`-file` *filename*	Outputs a list of the available cells for decoupling capacitance insertion to the specified file. This file can then be used by the `addDeCapCellCandidates` command to define cell candidates in a different session, or after cell candidates have been deleted.

Example

Following is a sample report generated by using the `reportDeCapCellCandidates` command:

```
############################################################
# Generated by: Cadence Innovus
# OS:         Linux x86_64(Host ID icdopt70s)
# Generated on: Tue Jan 25 11:47:55 2011
# Design:     dtmf_chip
# Command:     reportDeCapCellCandidates
############################################################
#The available decoupling capaictance cells:
#--------------------------
#Cell Name    Cap (fF)
#--------------------------
DECAP1 10
DECAP8 5
#--------------------------
```

Related Information

- Placing the Design chapter in the *Innovus System User Guide*
    - Adding Decoupling Capacitance
- `addDeCapCellCandidates`
- `clearDeCapCellCandidates`

reportDelayCalculation

```
reportDelayCalculation
[-help]
[-active_arcs]
-from string
[-max]
[-min]
[-outfile filename ]
[-show_all_attackers]
[-si]
[-thresholds]
-to string
[-view string ]
[-voltage]
[-waveform]
```

Reports the delay calculation information for a cell or net timing arc. You can use this command to report delay calculation details for the specified timing arc. The delay calculation report may be useful for debugging timing or for verifying timing data.

You can run the `report_timing` command before running `reportDelayCalculation` to have the correct timing window and aggressor slew.

The `reportDelayCalculation` command output shows 3-sigma multiplier, instead of single sigma. This ensures that the sigma representation for both the delay and transition time is the same.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reportDelayCalculation` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reportDelayCalculation`.
`-active_arcs`	Disables reporting of all the non-active parallel delay arcs and reports only the valid check arcs.
`-from` *string*	Specifies the name of the From port or pin. If the From port or pin is output of a cell and To port or pin is input of a cell, delay is calculated for the net and the delay type in the report is 'net delay.' If the From port or pin is input of a cell and To port or pin is output of a cell, delay is calculated for the cell and the delay type in the report is 'cell delay.'
`-max`	Indicates that the delay calculation report is for the worst-case operating conditions in min-max mode. If neither `min` nor `max` arguments are specified, then the default mode is set to `max`.
`-min`	Indicates that the delay calculation report is for the best-case operating conditions in min-max mode. If neither `min` nor `max` arguments are specified, then the default mode is set to `max`.
`-outfile` *filename*	Specifies the name of the output file in which to save the delay calculation report.
`-si`	Reports signal integrity (SI) related information.
`-show_all_attackers`	Allows you to report all the small attackers.
`-thresholds`	Displays the rise delay, rise slew, fall delay, fall slew, and slew delay threshold values for the From and To pins.
`-to` *string*	Specifies the name of the To port or pin. If the From port or pin is output of a cell and To port or pin is input of a cell, delay is calculated for the net and the delay type in the report is 'net delay.' If the From port or pin is input of a cell and To port or pin is output of a cell, delay is calculated for the cell and the delay type in the report is 'cell delay.'
`-view` *string*	Specifies the view name for which to print the delay calculation report when using the multi-mode multi-corner (MMMC) mode.

`-voltage`	Displays the voltage of the cell or net timing arc.
`-waveform`	Reports waveforms of the specified pins.

Examples

- The following command shows the cell delay calculation report for the From pin I1/A and To pin I1/Y:

```
reportDelayCalculation -from I1/A -to I1/Y
From pin : I1/A
To Pin : I1/Y
Cell : S2INVV1D1
Library : test

- setSIMode

saveExcludeNet

```
saveExcludeNet [-help] -file fileName
```

Reports the list of nets that are excluded from delay calculation. This includes the nets excluded by the delaycal_exclude_net variable and the nets that exceed the default value of 1,000 pins. You can use this command to save a file listing excluded nets previously defined using the `delaycal_exclude_net` variable.

Use this command after performing delay calculation.

Parameters

`-help`	Outputs a brief description that includes type and default information for the `saveExcludeNet` parameter. For a detailed description of the command and its parameter, use the man command: `man saveExcludeNet`.
`-file` *fileName*	Specifies the name of the excluded net file.

Example

- The following command saves the list of excluded nets to a file named `myfile.exc`:

  ```
  saveExcludeNet -file myfile.exc
  ```

saveSignalStormConstraint

```
saveSignalStormConstraint
[-help]
-outfile fileName
```

Translates constraint information from the Innovus software, such as boundary slews and loads, into signalStorm constraint syntax, and outputs it into a specified file. This file can then be included in, or sourced by, a signalStorm script to run standalone signalStorm. Use this command after loading the netlist and timing constraints.

Parameters

`-help`	Outputs a brief description that includes type and default information for the `saveSignalStormConstraint` parameter. For a detailed description of the command and its parameter, use the man command: `man saveSignalStormConstraint`.
`-outfile` *`fileName`*	Specifies the file to which to output the constraint information.

Examples

The following command saves a file containing Signal Storm constraint information:

```
saveSignalStormConstraint -outfile signalStorm.sndc
```

setDelayCalMode

```
setDelayCalMode
[-help]
[-accuracy_level level]
[-advanced_pincap_mode {0 | 1 | 2}]
[-advanced_node_pin_cap_settings {true | false}]

[-socv_use_lvf_tables {all | delay | slew | constraint}]
```

Sets global parameters for delay calculation. Use this command to specify any required delay calculation mode settings before running any commands that perform delay calculation, such as timing analysis and optimization. The parameters specified with the `setDelayCalMode` command are then used automatically whenever delay calculation takes place.

Use the `getDelayCalMode` command to return the current settings for the `setDelayCalMode` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setDelayCalMode` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setDelayCalMode`.
`-accuracy_level` *level*	Sets the accuracy level for delay calculations. You can use the `-accuracy_level` parameter to enable new enhancements for different process nodes (without using the `setDesignMode -process` parameter). **Note**: However, you can set the `setDesignMode -process` parameter to enable the delay accuracy level equivalent to the values given below: setDesignMode -process 16 == setDelayCalMode -accuracy_level 0 setDesignMode -process 10 == setDelayCalMode -accuracy_level 1 setDesignMode -process 7 == setDelayCalMode -accuracy_level 2 setDesignMode -process 5 == setDelayCalMode -accuracy_level 3 setDesignMode -process 3 == setDelayCalMode -accuracy_level 4 *Default*: 0, *Min*: 0, *Max*: 4

`-advanced_pincap_mode {0 | 1 | 2}`	Simulates the current stage and receiver stages together, such that the back miller effect is modeled dynamically. You can specify the following options: • `0`: Receiver current sources are computed using ECSM/CCS capacitance tables with the estimated input slew. • `1`: Receivers are no longer modeled as simple non-linear current source models. This results in increasing the delay calculation accuracy significantly as the modeling back miller effect improves. • 2: Uses advanced simulation-based approach to model the receiver back miller effect. *Default*: `0`
`-advanced_node_pin_cap_settings {true | false}`	Enables advanced node pin cap settings. *Default*: `false`

`-combine_mmmc {none | early_late | early_late_corner}`	Specifies whether delay calculation runs are to be combined for delay calculation simulations. This parameter provides user control for improving the run time of AAE for all analysis types by combining runs for early and late simulations into a single simulation. The views with common delay corners may also be combined into a single delay calculation simulation for added run time improvement. You can specify one of the following options: • `none`: Combines any delay calculation runs. Individual delay calculation simulations are performed for early and late simulations. This may result in significant CPU performance degradation due to the increased number of simulation runs performed. • `early_late`: Combines early and late simulations of a single corner into one delay calculation simulation. This will improve CPU performance by avoiding unnecessary delay calculation simulations. • `early_late_corner`: Combines early and late simulations of a single corner, and also combines views with common delay corners into a single delay calculation simulation. For example, the software will combine views with different `set_case_analysis` statements in one single simulation. This can result in a significant improvement in the CPU performance by avoiding unnecessary delay calculation simulations. *Default*: `early_late_corner`
`-early_irdrop_data_type {best_average | worst | best | average | worst_average}`	Allows you to set the early IR drop EIV values for different EIV voltages. *Default*: `worst`

`-enable_high_fanout {true | false}`	When this parameter is set to true, the default net delay will be annotated on high fanout nets. A net will be treated as a high fanout net when the fanout is more than the limit specified using the `delaycal_use_default_delay_limit` global variable. The default value of this variable is `1000` fanouts. The default net delay is also specified using this variable. The default net delay is 1ns. The cell delay will use the lumped capacitance that is specified using the `delaycal_default_net_load` global variable for table lookup. The default net load is `0.5pF`. The driver slew will use the default value of `0ps`, which can be changed by using the `delaycal_input_transition_delay` global variable and there will be no slew degradation along the interconnect. The default value of this parameter is `false`.
`-enable_input_slew_sensitivity_on_constraint {true | false}`	Enables the input slew sensitivity on constraints. When set to `true`, the input slew sensitivities at constrained and related pins will be considered by timing check sigma calculation. When set to `false`, the timing check arc is derived based on the nominal or mean slews only. *Default*: `false`
`-enable_quiet_receivers_for_hold {true | false}`	When set to `true`, the software forces some receivers as static (“quiet”). To compute the worst-case delays for early analysis, the software assumes that the receivers are not switching. This yields more conservative early delays. When set to `false`, the software assumes receivers may switch. *Default*: `false`

`-equivalent_waveform_model {none | no_propagation | propagation}`	Controls the equivalent waveform model to be used. You can specify one of the following options:
	• `none`: When this option is specified, the waveform shape beyond slew measurement points does not impact delays. This mode is equivalent to setting the following options in the previous releases:
	`setDelayCalMode -equivalent_waveform_model_type none`
	`setDelayCalMode -equivalent_waveform_model_propagation false`
	• `no_propagation`: In this mode, the impact of receiver waveform shape on the next stage delay is estimated and adjusted the net delay of the current stage. This mode is equivalent to setting the following options in the previous releases:
	`setDelayCalMode -equivalent_waveform_model_type ecsm`
	`setDelayCalMode -equivalent_waveform_model_propagation false`
	• `propagation`: When specified, the impact of input waveform shape is considered during delay calculation and the waveforms are propagated across each stage of the entire path.This mode is equivalent to setting the following options in the previous releases:
	`setDelayCalMode -equivalent_waveform_model_type ecsm`
	`setDelayCalMode -equivalent_waveform_model_propagation true`

	Default: `none`
`-equivalent_waveform_model_for_timing_check {true | false}`	Models the waveform distortion effect for timing check value look ups at both the data and clock pins. The model uses simulations to convert the distorted waveforms into equivalent waveforms (pre-driver waveforms in the libraries) by matching the pin CCB output waveforms. This feature requires the CCSN library. *Default*: `false`
`-ewm_type {moments | simulation}`	Specifies the equivalent waveform model (EWM) to be used. The options are described below: • `moments`: Enables moment-based equivalent waveform model. • `simulation`: Enables simulation-based equivalent waveform model. The simulation-based EWM is required for predicting delay in noisy waveforms. The `simulation` option requires noise models (ECSMN/CCSN). If noise models are not available, then the software defaults to moments-based EWM. It is recommended to use simulation-based EWM as it is more accurate than moment-based EWM. *Default*: `moments`

`-honorSlewPropConstraint {true | false}`	Determines whether to propagate the slew from the disabled timing arcs to the output pin. When this parameter is set to false, the slew from the disabled timing arc affects the delay of the next stage. Setting this parameter to false results in more accurate slew computation for the disabled timing arcs but can take longer run time. When set to true, the timing constraints defined using commands such as `set_disable_timing` and `set_case_analysis` impact the slew propagation, and the slew from the disabled timing arcs is not propagated. *Default* : `true`
`-irdrop_data_type {best_average | worst | best | average | worst_average}`	Allows you to set the early/late IR drop EIV values for different EIV voltages. *Default*: `worst`
`-irDrop_window_based {none | late | early | both}`	Searches window-based EIV values from the EIV database. *Default*: `both`
`-late_irdrop_data_type {best_average | worst | best | average | worst_average}`	Allows you to set the late IR drop EIV values for different EIV voltages. *Default*: `worst`
`-library_interpolation_mode {linear | non_linear}`	Controls library scaling mode - `linear` or `non_linear` - for the interpolation flow. *Default*: `linear`

`-ignoreNetLoad {true | false}`	When set to true, this parameter removes the default system requirement for having RC parasitics available for delay calculation. This parameter is used to get initial design timing when the design is not in a proper state to generate extracted results and an external SPEF source of parasitics is not available. The results obtained by enabling this parameter are equivalent to those obtained using a zero-cap, zero-resistance wire-load model for estimating delays. *Default* : `false`
`-reportOutBound {true | false}`	Generates a report that contains a list of index values (input transition) in the delay tables that are beyond the index range. The index values detected by this parameter can cause inaccurate delay values to be calculated. The report generated by this parameter can be used for debugging. When this parameter is set to `true`, the extrapolation information will be dumped into the following two files: • <design-name>.dc.outbound.slew.early.<view-name>.txt • <design-name>.dc.outbound.slew.late.<view-name>.txt The software writes a warning message in the log files noting that there are input transition values that are out of the index range of the timing table. The warning message also provides the file name for viewing the detail report. When set to `true`, the `-reportOutBound` parameter will generate reports that can be controlled using the `setOutboundReport` command. *Default*: `false`

`-reset`	Resets parameters to their default values. The `-reset` parameter *must* be the first parameter specified. If you specify `-reset` by itself, the software resets all `setDelayCalMode` parameters to their default values. If you specify parameters after `-reset`, the software resets only those parameters to their default values. **Note**: Any values that do not already match the default value and are reset will be reported.
`-SIAware {true | false}`	Enables SIAware delay calculation that also includes cross-talk induced delays. *Default*: `false` **Note:** SIAware delay calculation requires the design to be in Multi-Mode, Multi-Corner (MMMC) Mode and the analysis type to be set to on-chip variations. **Note**: The `timeDesign` and `optDesign -postRoute` commands will set the `-siAware` option to `true` to perform SI analysis. To disable SI analysis at the post-route stage you must explicitly set `-siAware` to `false`, so that base analysis is performed.
`-skip_slew_merge_from_disabled_path {false | true}`	Avoids merging slews from unconstrained, segmented paths and black-box output pin. When set to `true`, the software does not allow merging transitions from disabled paths. *Default*: `false`
`-signoff_alignment_settings {true | false}`	Enables signoff alignment settings. *Default*: `false`

`-slewOutBoundLimitHigh` *value*	Limits the maximum slew used in the analysis to the specified value. *Min*: 1 *Max*: 3.40282346638529e *Data type*: float *Default*: 3.40282346638529e+38
`-slewOutBoundLimitLow` *value*	Limits the minimum slew used in the analysis to the specified value. *Min*: 0.001 *Max*: 1 *Data type*: float *Default*: 0.5
`-socv_accuracy_mode {low | medium | high | ultra}`	Allows the ability to control levels of accuracy. This parameter specifies level-based accuracy effort for delays and slews. You can use one of the following options: • `low`: Ignores correlation between slews and delays. This is the default setting. • `medium`: Models correlation between immediate slew and delay. • `high`: Considers skewness of non-gaussian distribution into account for computing quantiles. The skewness is local to one stage only. • `ultra`: Considers skewness of non-gaussian distribution, and also propagates skewness to the next stage in PBA analysis.
`-socv_lvf_mode {moments | early_late}`	Controls interpretation of LVF data. *Default*: `moments`

`-socv_machine_learning_level {0 | 1}`	Enables the SOCV machine learning mode. For accurate SOCV analysis, the software creates several statistical models, which are not available with standard LVF library, such as correlation between cells delay and output slew, conversion of moments from late/early sigma tables, and effects of waveform distortion on sigma and mean shift. When the `-socv_machine_learning_level` parameter is set to 1, the software enables several machine learning algorithms to generate such models internally. *Default*: 0
`-socv_use_lvf_tables {all | delay | slew | constraint}`	Controls which type of variations are considered during analysis. *Default*: `all`

Examples

- The following command enables waveform propagation along the path for equivalent waveform model:

  ```
  setDelayCalMode -equivalent_waveform_model propagation
  ```

- If you have set the value of the `-SIAware` parameter to `true`, use the following command to reset the value of the parameter to the default value, which is `false`, and whch disables SI analysis during delay calculation:

  ```
  setDelayCalMode -reset -SIAware
  ```

  Now when you retrieve the value of the parameter using the `getDelayCalMode` command, the software returns the following:

  ```
  getDelayCalMode -SIAware
  -SIAware false # enums={true false}, default=false
  false
  ```

Related Information

- "Base Delay Analysis" chapter in the *Innovus System User Guide.*
- `getDelayCalMode`

translateSNDCSetupFile

```
translateSNDCSetupFile
[-help]
sndcSetupFile
outputFile
```

Uses a signalStorm delay calculator setup file as input and converts the transition time and capacitative loading portions to timing constraints commands, such as `set_annotated_transition` and `set_load`. The timing constraints commands are included in the specified output file. This command is useful only if you are using standalone signalStorm delay calculation.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `translateSNDCSetupFile` parameter. For a detailed description of the command and all of its parameters, use the man command: `man translateSNDCSetupFile`.
`outputFile`	Specifies the name of the output file, which contain the timing constraints commands.
`sndcSetupFile`	Specifies the name of the signalStorm delay calculator setup file that will be converted.

Example

The following command uses a signalStorm delay calculator setup file named `sndc.setup` and generates the `constraints.rpt` file, which contains the timing constraints commands:

```
translateSNDCSetupFile sndc.setup constraints.rpt
```

writeSetLoad

```
writeSetLoad
[-help]
[-direct]
[-excludeZeroCap]
[-includePinCap]
[-wire_load]
[-view viewName]
-file outFile
```

Writes the capacitive loading on each net to an output file. By default, the capacitance value does not include pin capacitance. You can set the load using the `set_load` command or else the software uses the load defined in the SPEF file. The latter is preferred for transferring parasitic information since the `set_load` command does not give full information regarding RCs.

You can use this command for dumping capacitance values for loading into third party tools. You can also use it for debugging, to examine cap load values for nets. But you can achieve this by other means such as using `report_net` and `get_property` commands, which does not require you to dump a file.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `writeSetLoad` parameter. For a detailed description of the command and all of its parameters, use the man command: `man writeSetLoad`.
`-direct`	Refers the ports directly for which the capacitive loading will be written. This option removes the dependency of using the get_nets command.
`-excludeZeroCap`	Excludes the nets not annotated in the design while writing out the capacitive loading on each net to the output file.
`-file outFile`	Specifies the name of the output file.
`-includePinCap`	Includes the pin capacitance while writing out the capacitive loading on each net to the output file.
`-view viewName`	Specifies the view name to use for writing out the capacitive loading.
`-wire_load`	Adds option '-wire_load' to "set_load" (i.e. set_load -wire_load) only on the output (out) and bi-directional (inout) ports in the output file.

Example

The following command writes the capacitive load in the report file `load.rpt`:

```
writeSetLoad -file load.rpt
```

The following report is generated:

```
set_load 1e-05 [get_nets {sig_out4000}]

set_load 0.00011 [get_nets {sig_in1000}]

set_load 0.00011 [get_nets {sig_in1001}]

set_load 0.00015 [get_nets {node_out6000}]
```

- delaycal_support_wire_load_model
- delaycal_use_default_delay_limit

delaycal_default_net_delay

`delaycal_default_net_delay` *`delay_value`*

Type: String

Default: `1000ps`

Sets the default net delay for delay calculation. The software uses this default value for nets that exceed 1,000 terminals. Delay calculation is performed for nets with fewer than 1,000 terminals.

Example

- The following global variable sets the net delay to `3 ns` for nets that exceed 1,000 terminals:

  ```
  set delaycal_default_net_delay 3ns
  ```

  The software displays the following information:

  ```
  Set Default Net Delay as 3000 ps.
  ```

- delaycal_default_net_load
- delaycal_input_transition_delay
- delaycal_use_default_delay_limit

delaycal_default_net_load

`delaycal_default_net_load` *`load_value`*

Type: String

Default: `0.5pF`

Sets the default net load for delay calculation. You can use this global variable to specify the default net load value that is used for nets that exceed 1,000 terminals.

Example

- The following global variable sets the net load to `2 pF` for nets that exceed 1,000 terminals:

  ```
  set delaycal_default_net_load 2pF
  ```

  The software displays the following information:

  ```
  Set Default Net Load as 2 pF.
  ```

Related Information

- "Base Delay Analysis" chapter in the *Innovus System User Guide*

Related Global Variables

- `delaycal_default_net_delay`
- `delaycal_input_transition_delay`
- `delaycal_use_default_delay_limit`

delaycal_input_transition_delay

`delaycal_input_transition_delay`

Type: String

Default: `4ps`

Sets the default input transition delays and the ideal clock transition time for delay calculation.

The default transition will be used at all places where transition is not defined (either by `set_input_transition`, `set_annotated_transition`, or any driving cell). For all the ports/pins that do not have any driving cell in fanin (or `set_input_transition`/`set_annotated_transition` settings) will also use this default slew value.

Note: It is mandatory to specify time units for this command. Valid time units are ps, ns, etc.

In addition, the default input transition value is applied to those pins to which the slew was not propagated. For example:

- Tiehi or tielo pins
- Macro output pins, which do not have a related input pin

Note: A macro output pin, which has a related input pin will most likely have slew propagation from the related input pin to the output pin.

- Macro output pins for which all the timing arcs are disabled
- Input ports without a user-specified transition value

Example

- The following global variable sets the input transition delay to 300ps for nets that exceed 1,000 terminals:

  ```
  set delaycal_input_transition_delay 300ps
  ```

  The software displays the following information:

  ```
  Set Input Pin Transition Delay as 300 ps.
  ```

Related Information

Related Global Variables

- delaycal_default_net_delay
- delaycal_default_net_load
- delaycal_use_default_delay_limit

delaycal_rd_rnet_fraction_threshold

`delaycal_rd_rnet_fraction_threshold`

Type: Double

Default: `0.000000`

Specifies the ratio of drive resistance to net resistance at which special handling of early path delays is invoked. When active, slews across early delay path nets are not degraded.

Example

- The following global variable specifies the Rd / Rnet threshold to be `1.0` for which early net slews are not degraded:

  ```
  set delaycal_rd_rnet_fraction_threshold 1.0
  ```

delaycal_support_min_max_pin_cap

```
delaycal_support_min_max_pin_cap {0 | 1}
```

Type: Integer

Default: `1`

Controls whether SignalStorm delay calculation respects Liberty pin capacitance ranges. A "`0`" setting is only required for correlation with the feDC delay engine.

Example

- The following global variable disables SignalStorm delay calculation support for Liberty pin capacitance ranges:
  ```
  set delaycal_support_min_max_pin_cap 0
  ```

Related Global Variable

- `delaycal_support_rise_fall_pin_cap`

delaycal_support_rise_fall_pin_cap

```
delaycal_support_rise_fall_pin_cap {0 | 1}
```

Type: Integer

Default: `1`

Controls whether feDC or SignalStorm delay engines respect Liberty `rise_capacitance` and `fall_capacitance` attributes.

Note: This global variable is for backward compatibility.

Example

- The following global variable disables feDC and SignalStorm delay calculation support for Liberty `rise_capacitance` and `fall_capacitance` attributes:

  ```
  set delaycal_support_rise_fall_pin_cap 0
  ```

Related Global Variable

- `delaycal_support_min_max_pin_cap`

delaycal_support_wire_load_model

```
delaycal_support_wire_load_model {0 | 1}
```

Type: Integer

Default: `0`

Enables support of Liberty wire-load models and related SDC commands.

Related Information

- "Base Delay Analysis" chapter in the *Innovus System User Guide.*

Related Commands

- `report_wire_load`
- `reset_wire_load_mode`
- `reset_wire_load_model`

- `set_wire_load_mode`
- `set_wire_load_selection_group`

delaycal_use_default_delay_limit

`delaycal_use_default_delay_limit`

Type: Integer

Default: `1000`

Sets the pin number threshold for nets for delay calculation. Nets that have more than the specified number of pins are excluded from delay calculation, and use the default delay values instead.

Net default delay values are:

- Net delay: `1 ns`
- Transition time: `0 ps`
- Net load: `0.5 pF`

Note: In post route stage, default delay calculation does not honor this variable. Slews and delays are computed based on actual parasitics.

To change the default delay values, set the following global variables:

- `delaycal_default_net_delay`
- `delaycal_default_net_load`
- `delaycal_input_transition_delay`

Example

- The following global variable sets the pin threshold number for nets to 2,000:

  ```
  set delaycal_use_default_delay_limit 2000
  ```

  The software displays the following information:

  ```
  Set Using Default Delay Limit as 2000.
  ```

Nets that exceed pin count of 2,000 are excluded from delay calculation and use the default delay values.

addBumpConnectTargetConstraint

```
addBumpConnectTargetConstraint
[-help]
{-bump list_of_bumps | -selected }
{ {-instName instance_name
      [ {-pinName pin_name | -netName net_name}
        [ -portNum value ]]}
    | -PGConnectType {ioring corering stripe iopin}}
```

Adds a string property in one or multiple bumps. If any of the specified/selected bump has a property value already, Innovus checks whether the new property value is exactly the same as the existing one. If not, the new property value is concatenated to the existing property string and separated by a space.

Using this command, you can add either a complete port numbering property (`inst:pin:port`) or an incomplete property, such as `inst` or `inst:pin` to PG bumps.

Parameters

`-help`	Prints a brief description that includes type and default information for each `addBumpConnectTargetConstraint` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man addBumpConnectTargetConstraint`
`-bump` *`list_of_bumps`* | `-selected`	
	Adds bump connect target constraint on specified or selected bumps. The option `-bump` can accept wildcards and `-selected` can have multiple bumps selected. In the multiple bump case, the same property is added onto all the bumps.
`-instName` *`instance_name`*	
	Specifies the connect target instance. If only `-instName` is specified and `-netName` or `-pinName` is not specified, the tool automatically finds the most suitable geometries in the instance specified by *`instance_name`*.
`-netName net_name`	Specifies the connect target net name. **Note:** This option cannot be used with `-pinName`.
`-PGConnectType {ioring corering stripe iopin}`	
	Specifies the PG connect type. Connection type can be I/O Ring (`ioring`), Core Ring (`corering`), Stripe (`stripe`), or I/O Pin (`iopin`).
`-pinName` *`pin_name`*	
	Specifies the connect target pin name. **Note:** This option cannot be used with `-netName`.
`-portNum value`	Specifies the connect target port number.

Examples

- The following command adds `bump_connect_target` property onto `Bump_1` on `VDD` net. Then `Bump_1` pairs with `PORT1` under the PIN connecting to `VDD` net of arealo `IOPADS_INST/esd`.
  ```
  addBumpConnectTargetConstraint -bump Bump_1 -instName IOPADS_INST/esd -netName VDD -portNum 1
  ```
- The following command adds `bump_connect_target` property onto `Bump_1`. Then `Bump_1` pairs with `PORT2` under the PIN whose name is `vdd!` of instance `DTMF_INST/ PLLCLK_INST`. `PORT2` is required with PORT `CLASS BUMP` attribute in LEF.
  ```
  addBumpConnectTargetConstraint -bump Bump_1 -instName DTMF_INST/PLLCLK_INST -pinName vdd! -portNum 2
  ```

assignBump

```
assignBump
[-help]
[{-area x1 y1 x2 y2 | -selected }]
[-constraint_file file_name]
[-exclude_region llx lly urx ury ...]
[-maxDistance distance]
[-multiBumpToMultiPad]
[{[[-pgnet net_list] | [-exclude_pgnet net_list]][-pginst instance_list]} [-pgonly]]
```

Assigns the bumps closest to the I/O cells, using euclidean distance, and adds bump connection target property onto bump. These bumps can be signal bumps specified in the Verilog netlist or power/ground (PG) bumps specified in the command line. From the 14.1 release, `assignBump` adds bump connect target to bumps by default during bump assignment.

This command is for flip chip designs. Bumps must be created or loaded from the I/O assignment file.

Use this command after the design is placed.

Note: The `assignBump` command does not affect any existing assignment. Hence, it will not reassign any existing power/ground assignments.

Support for CLASS BUMP Property

The `assignBump` command supports the `CLASS BUMP` of `PORT` in `LEF`. Using the `LEF` 5.7 syntax, you can add the `CLASS BUMP` property in the `PORT` of the hard macro `LEF`. With this property, `fcroute` is able to route from these ports to the assigned bump.

The `assignBump` command supports I/O pads or hard macros that have pins with multiple geometries. For the following hard macro definition in LEF, `assignBump` assigns three bumps for `block1`, including two bumps for pin `signal1` and one for pin `powerpin`.

:

```
    MACRO block1
        PIN signal1
            PORT
                CLASS BUMP ;
                LAYER … ;
                RECT … ;
            END
            PORT
                CLASS BUMP ;
                LAYER … ;
                RECT … ;
            END
        END signal1
        PIN powerpin
            PORT
                CLASS BUMP ;
                LAYER … ;
                RECT … ;
```

```
        END
      END powerpin
  END block1
```

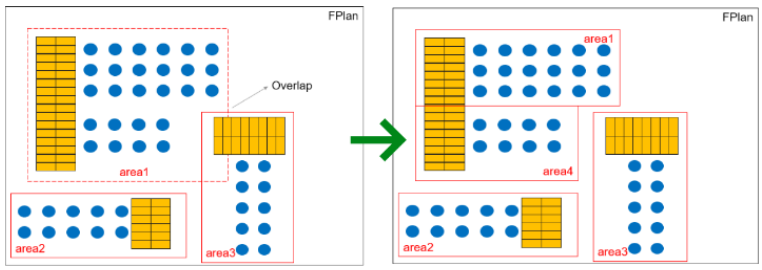
`fcroute` also supports routing for this kind of assignment. In the above example, routing happens from the two signal bump to the two port geometries and one power bump to the powerpin geometry with `CLASS BUMP` property.

The behavior of `CLASS BUMP` is summarized as below:

- If the `CLASS BUMP` property is not defined in any cell, `assignBump` assigns one bump to each IO pin and `fcroute` works normally.
- If any pin port in `CLASS PAD AREAIO` or `CLASS BLOCK` cells contains the `CLASS BUMP` property, `assignBump` uses the property for assignment.
- Each pin port with the `CLASS BUMP` property will have a bump assigned. This means a pin can have multiple bumps assigned to it if it has more than one port defined as CLASS `BUMP`. `fcroute` honors this property and routes the port and its assigned bump. A port with `CLASS BUMP` attribute with multiple geometries is considered as one object for assignment and routing.

Parameters

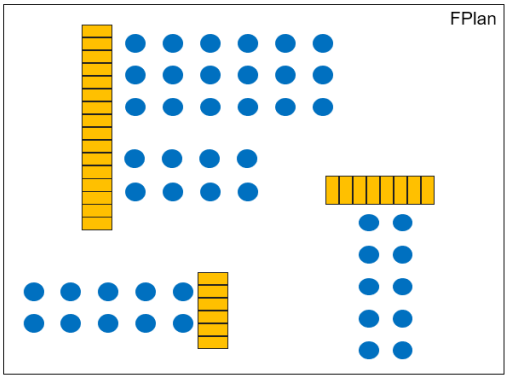
`-help`	Outputs a brief description that includes type and default information for each `assignBump` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man assignBump`
`-area` *`x1 y1 x2 y2`*	Assigns objects in the area specified by the *`x1`*, *`y1`*, *`x2`*, and *`y2`* coordinates. • If the specified area includes only bumps, `assignBump` assigns the selected bumps to IO cells based on the total shortest distance. • If the specified area includes only IO cells, `assignBump` assigns the selected IO cells to bumps based on the total shortest distance. • If the specified area includes both IO cells and bumps, then `assignBump` assigns the selected IO cells to the selected bumps. If the number of bumps are not enough, `assignBump` issues a warning. **Note:** The selected objects must be same as the ones selected by the command `windowSelect`. For designs with double pad rows, the following conditions must be kept in mind while defining area with `assignBump -area`: • All IO pads inside the area should be regular and should be placed in either two rows or two columns. If the pads are irregular, the tool will turn off double pad row assignment automatically and use the traditional optimization algorithm, based on minimal global length. • Define areas in such a way that there is only one double pad row in one area. • If two areas overlap, it means there are now two double pad rows in one area. The results of bump assignment in such situations might not be the most optimal. To get the most optimal results, split one of the areas into two to avoid overlap as shown below:



Now, you can assign bumps using the following commands:

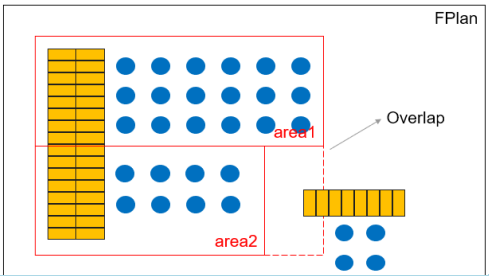
```
assignBump -area area1
assignBump -area area2
assignBump -area area3
assignBump -area area4
```

Note that for assigning bumps in a design with single pad rows, you can use `assignBump` without the `-area` option.



In the following example, the double pad area should be split to avoid overlaps as shown below. The rest of the bumps can be assigned without using the `-area` option:

```
assignBump -area area1
assignBump -area area2
assignBump
```



`-constraint_file` *file_name*	Specifies the path to the file containing bump assignment constraints. At present, the following types of bump assignment constraints are supported: • `SHARE_FIND_PORT` constraint to filter unnecessary ports • `ASSIGN_ANALOG_PG_NETS` constraint to specify which signal nets are analog PG nets • `SHARE_IGNORE_*` and `ASSIGN_IGNORE_*` constraints to exclude instances, macros, pins, or nets for assignment. • `ASSIGN_PAD2BUMP_RATIO` constraint to specify the pad to bump ratio per net, macro, or instance. For more information on specifying bump assignment constraints, refer to the "Using Bump Assignment Constraints" section of the Flip Chip Methodologies chapter of the *User Guide.*
`-exclude_pgnet` *net_list*	Specifies the names of the power/ground nets that must be excluded from bump assignment. Wild cards are supported in net names. The net names should be enclosed in double quotation marks (" ") or braces {}.
`-exclude_region` *llx lly urx ury ...*	Excludes bumps in the area specified by the lower-left x (*llx*), lower-left y (*lly*), upper-right x (*urx*), and upper-right y (*ury*) coordinates. You can specify multiple regions, which may be disjoint.
`-maxDistance` *distance*	Specifies the maximum distance, in microns, to look for a bump connection.
`-multiBumpToMultiPad`	Specifies that multiple pads need to be assigned to multiple bumps. This parameter is useful when you need to assign multiple pads on one net to multiple bumps based on shortest distance.
`-pginst` *instance_list*	Specifies the names of power/ground instances to which the power bumps are assigned. The instance names should be enclosed in double quotation marks (" ") or braces {}.
`-pgonly`	Assigns only power/ground nets to bumps. When this option is specified, signals are not assigned to bumps. **Note:** Option `-pginst` or `-pgnet|-exclude_pgnet` is required for option `-pgonly`.
`-pgnet` *net_list*	Specifies the names of the power/ground nets to which the bumps are assigned. The net names should be enclosed in double quotation marks (" ") or braces {}. By default, bumps are assigned to all pads whose ports are connected to power/ground nets.
`-selected`	Assigns selected bumps to the closest I/O instances or selected I/O instances to the closest bumps. • If only bumps are selected, `assignBump` assigns the selected bumps to IO cells based on the total shortest distance. • If only IO cells are selected, `assignBump` assigns the selected IO cells to bumps based on the total shortest distance. • If both IO cells and bumps are selected, `assignBump` assigns the selected IO cells to the selected bumps. If there are not enough bumps, `assignBump` issues a warning. **Note:** The `-selected` parameter works with other options of `assignBump`, except `-area` and `-exclude_region`.

Examples

- The following command assigns bumps to the power and ground nets, `VDD` and `VSS`, within the area specified by `600.0` (`llx`), `960.0` (`lly`), `2600.0` (`urx`), and `4100.0` (`ury`) coordinates.

  ```
  assignBump -pgnet {VDD VSS} -area {600.0 960.0 2600.0 4100.0}
  ```

- The following command assigns multi-PG pads to bumps:

  ```
  assignBump -pgonly -pgnet {VDD VSS}
  ```

Related Information

- `assignPGBumps`
- `assignSigToBump`

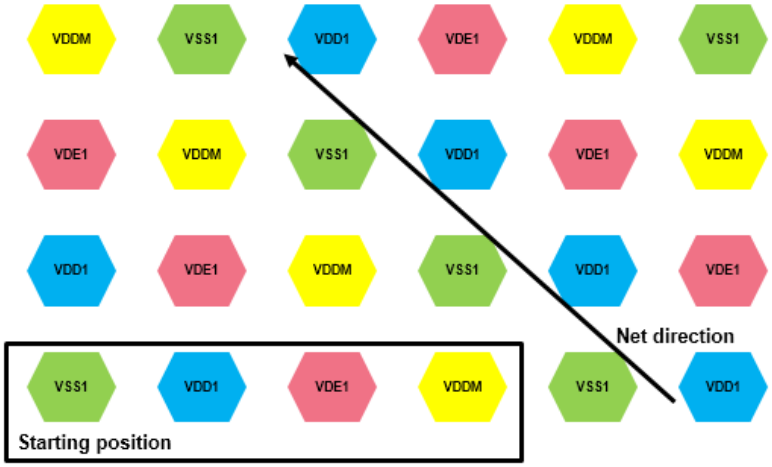
assignPGBumps

```
assignPGBumps
[-help]
[-connectType {ioring | corering | stripe | iopin}]
-nets {name_list}
[-selected | -floating | -bumps {bump_name_list}]
[-V | -H | -checkerboard [-square {width height}]]
```

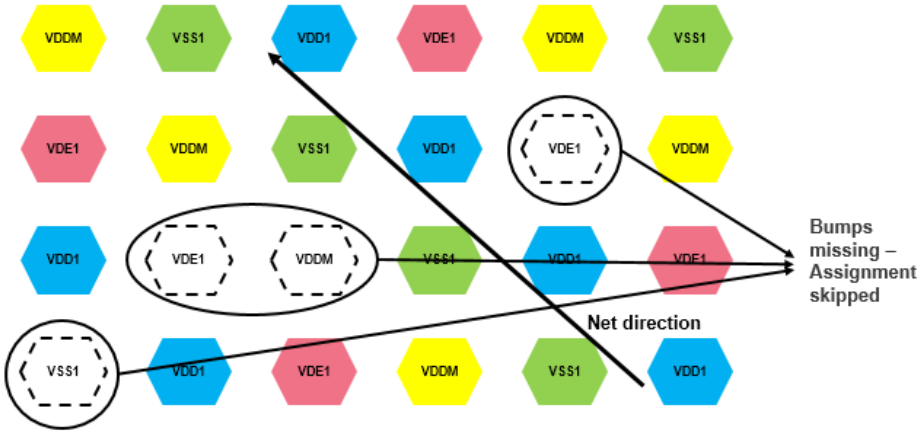
Assigns power and ground bumps to connect flip chip I/O pins and adds property value onto bumps. Use this command after bumps are created. It overwrites existing assignments for selected bumps.

Parameters

`-help`	Prints a brief description that includes type and default information for each `assignPGBumps` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man assignPGBumps`
`-bumps {bump_name_list}`	Specifies the names of the bumps to be assigned. The names must be enclosed in braces. Wildcards are supported in bump names. **Note**: This parameter cannot be used with `-selected` and `-floating`.
`-checkerboard`	Specifies that the checkerboard style of bump assignment will be used if multiple nets are defined using the `-nets` parameter:  The `-checkerboard` parameter is typically used for a regular (rectangular) bump array. To apply this pattern for an irregular (rectilinear) bump array, first form a regular array by creating virtual bumps in the areas where there are no bumps. Next, assign the bumps using the checkerboard pattern and then remove the virtual bumps. **Notes** • The checkerboard style can be used with more than two nets, as shown below: `assignPGBumps -nets {VSS1 VDD1 VDE1 VDDM} -checkerboard -selected`



The `-checkerboard` option for multiple nets can be used in a regular bump matrix with the same bump cell for all bumps and the same X/Y pitch between bumps. If bumps are missing in the pattern, the tool skips assignment to maintain the diagonal, staggered net direction.



- The checkerboard style can support irregular bump assignment when used with the `-square` parameter. For details, see the description of the `-square` parameter.

`-connectType {ioring | corering | stripe | iopin}`	
	Specifies the bump connect type when assigning power/ground bumps. Connection type can be I/O Ring, Core Ring, Stripe, or I/O Pin.
`-floating`	Assigns all floating bumps.

`-H`	Specifies that the horizontal style of bump assignment will be used if multiple nets are defined using the `-nets` parameter: `-nets {`*`name_list`*`}`	Specifies the net names. Net names must be enclosed in braces.
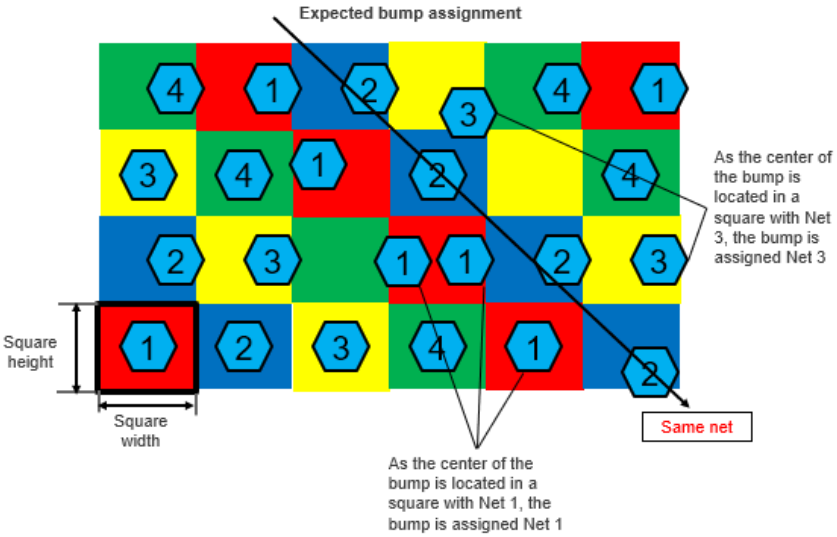
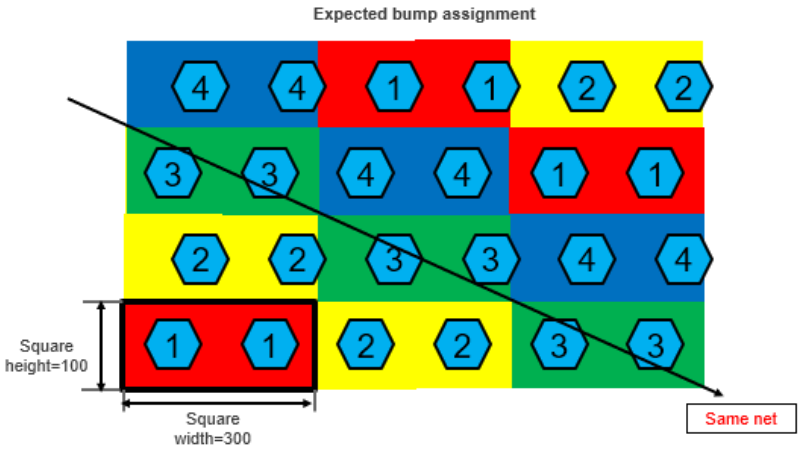
`-selected`	Assigns selected bumps.
`-square {`*`width height`*`}`	Specifies the width and height of a square in the checkerboard style of bump assignment. Use this parameter if you want to apply the checkerboard style of bump assignment for an irregular bump matrix. When you specify the `-square` parameter, the tool creates a virtual checkerboard made of squares of the specified dimensions and then assigns the squares with the specified nets. The square to which a bump belongs is determined based on the location of its center. The tool then assigns the corresponding net to the bump. For example, the following command creates a virtual checkerboard with squares of width 150 and height 100, assigns the squares with the Nets 1, 2, 3, and 4, and assigns the nets to bumps based on the square on which their center is located: `assignPGBumps -nets {1 2 3 4} -checkerboard -selected -square {150 100}` **Case A**  As shown in Case B below, the assignment is dependent on the location of the center of the bumps. **Case B**



The assignment also changes if you change the dimensions specified for the checkerboard squares. For example, the following command creates a virtual checkerboard with squares of width 300 and height 100.

```
assignPGBumps -nets {1 2 3 4} -checkerboard -selected -square {300 100}
```

Case C



Note that although the bump locations are same in both Cases A and C, the assignments in Case C are different from Case A because of the change in square dimensions.

Notes

- The `-square` parameter can be used only if `-checkerboard` is specified.
- The `-square` parameter can be used for selected as well as floating bumps.

`-V`	Specifies that the vertical style of bump assignment will be used if multiple nets are defined using the `-nets` parameter: 
Example

- The following command assigns selected bump to the power net `VDD`:
  ```
  assignPGBumps -nets VDD -selected
  ```
- The following command assigns only the specified bumps to the power net `VDD`:
  ```
  assignPGBumps -nets VDD -bumps {Bump_1 Bump_2 Bump_3}
  ```

- The following command assigns floating bumps to the specified nets in the horizontal style:
  ```
  assignPGBumps -H -floating -nets {VSS1 VDD1 VDE1}
  ```
- The following command assigns selected power/ground bumps in the checkerboard style to the VDD and VSS nets:
  ```
  assignPGBumps -selected -nets {VDD VSS} -checkerboard
  ```
- The following command assigns all the floating bumps in checkerboard pattern to the VDD and VSS nets:
  ```
  assignPGBumps -floating -nets {VDD VSS} -checkerboard
  ```

Related Information

assignSigToBump

```
assignSigToBump
[-help]
{ {{-net net_name | {-top_pin port [-bump_pin bump_pin_name]}} {-bumps bump_name_list | -selected}} }
```

Assigns selected or specified bumps to the specified net or pin. The command supports signal, power, as well as ground nets. Feedthrough bumps with multiple pins are also supported.

Parameters

`-help`	Prints a brief description that includes type and default information for each `assignSigToBump` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man assignSigToBump`
`-bump_pin` *`bump_pin_name`*	Specifies the name of the bump pin that has to be assigned to the specified top pin. Use this option for feedthrough bumps, which have multiple pins. This parameter can be used only with the `-top_pin` parameter.
`-bumps` *`bump_name_list`*	Specifies the bumps to be assigned to the net specified with `-net`. Use braces to enclose the bump names.
`-net` *`net_name`*	Specifies the signal or PG net to which bumps are to be assigned.
`-selected`	Assigns the selected bumps to the specified net.
`-top_pin` *`port`*	Specifies the name of the top-level pin to which bumps are to be assigned. After assignment, the pin name of the bump is the top-level pin name and the net name of the bump is the net name of the specified pin. This parameter cannot be used with the `-net` parameter.

Examples

- The following command assigns `bump_1` and `bump_2` to the signal net `sig[1]`:
  ```
  assignSigToBump -net sig[1] -bumps {bump_1 bump_2}
  ```
- The following command assigns `bump_1` to the power net `VDD`:
  ```
  assignSigToBump -net VDD -bumps bump_1
  ```
- The following command assigns the selected bumps to the ground net `VSS`:
  ```
  assignSigToBump -net VSS -selected
  ```
- The following command assigns the `PIN_1` pin of the `bump1` feedthrough bump to the top-level pin, `CLK_IN`:
  ```
  assignSigToBump -bumps bump1 -top_pin CLK_IN [-bump_pin PIN_1]
  ```

Related Information

changeBumpMaster

```
changeBumpMaster
[-help]
-bumpMasterName bumpMasterName
[-fromBumpMasterName bumpMasterName ]
[-location_type {cell_center cell_lowerleft geometry_center geometry_lowerleft}]
{-netName netName | -allBumps | -bump_name bump_list | -selected}
```

Enables you to replace the cell master for specified bumps.

Parameters

`-help`	Prints a brief description that includes type and default information for each `changeBumpMaster` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man changeBumpMaster`
`-allBumps`	Specifies that all bumps will use the new cell master specified using the `-bumpMasterName` parameter.
`-bumpMasterName bumpMasterName`	
	Specifies the name of the new cell master.
`-bump_name bump_list`	
	Specifies the list of bumps for which you want to change the bump master. Use this parameter if you want to change the cell master of specific bumps, which may or may not have the same cell master originally.
`-fromBumpMasterName bumpMasterName`	
	Specifies the name of the old cell master. Use this parameter to replace the cell master of bumps using a specific bump master.
`-location_type {cell_center cell_lowerleft geometry_center geometry_lowerleft}`	
	Specifies the location type. *Default*: `cell_lowerleft`
`-netName netName`	Specifies that all bumps connected to the specified net will use the new cell master. For example, if the *netName* is VDD, all connected bumps will use the cell master specified using the `-bumpMasterName` parameter.
`-selected`	Changes the bump master of selected bumps to the new cell master as specified using the `-bumpMasterName` parameter.

Examples

- The following command changes the cell master of selected bumps from `BUMPCELL` to `BGA_PAD`:
  ```
  changeBumpMaster -bumpMasterName BGA_PAD -selected -fromBumpMasterName BUMPCELL
  ```
  Note: The change happens only for those of the selected bumps that originally belonged to `BUMPCELL`. If a selected bump belongs to a cell master other than `BUMPCELL`, its cell master is not changed.
- The following command changes the cell master of all the bumps connected to the net `int` to `BUMP_PWR`:
  ```
  changeBumpMaster -bumpMasterName BUMP_PWR -netName int
  ```
- The following command changes the cell master of all the bumps in the design to `BUMP_PWR`:
  ```
  changeBumpMaster -bumpMasterName BUMP_PWR -allBumps
  ```
- The following command changes the the cell master of all the bumps connected to the net `int` to `BUMP_PWR` and specifies their location type as `geometry_center`:
  ```
  changeBumpMaster -bumpMasterName BUMP_PWR -netName int -location_type geometry_center
  ```

checkBondPadSpacing

```
checkBondPadSpacing [-help]
```

Checks for bond pad spacing violations after using the `spaceBondPad` command. You can use this command at any time after using the `spaceBondPad` command.

Parameters

`-help`	Prints a brief description of the `checkBondPadSpacing` command. For a detailed description of the command, use the `man` command: `man checkBondPadSpacing`

Related Commands

- `fixBondPad`
- `getBondPad`

[ [[-bumpPitch {pitch_value [bump_name]}]
   [-bumpToPinPitch {pitch_value {[bump_name] [inst_pin_name [pin_x pin_y]]}}]]
  | -bumpMaxPitch max_pitch_value | -bumpToEdgePitch pitch_value]
[-onBumpGrid [-onBumpGridTolerance bump_grid_name value]]
```

Checks the legality of the bump assignment and creates a report, which is either displayed in the console window or written to a file. Use this command for bump overlap and pitch checking. The `checkBump` command can be used after bumps are assigned with the `assignBump` command or defined in the I/O file with the signal name but without the `-fixed` constraint.

Bump-to-Bump Overlap Checking

`checkBump` checks bump overlaps, including overlap of dummy bumps, by default. If a bump overlaps with others, `checkBump` places violation markers on the center of the overlapped bumps and reports the total number of overlapped bumps.

The violation markers for bump overlap can be browsed in Violation Browser.

⚠ `checkBump`:

- Checks overlaps between regular bumps by checking for pin overlaps on bumps.
- Checks overlaps between dummy bumps by checking for OBS overlap.
- Checks overlaps between dummy bumps and regular bumps by checking for OBS and bump pin overlap.

Bump-to-Pin Overlap Checking

If `-bumpToPinOverlap` is used, `checkBump` checks for overlaps between bump shapes, including dummy bumps, and pins of the specified block. If the bump shape and the block pins are at the same location but on different layers, the tool does not consider them to be overlapping. However, if the bump shapes and the block pins are at the same location and on the same layer, they are reported as overlapping, as shown below:

Bump Pitch Checking

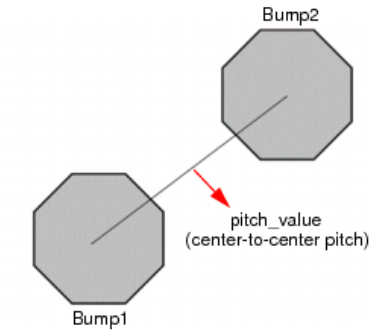
`checkBump` provides a bump pitch checking feature to record bumps that violate the bump pitch. The bump pitch checking feature has multiple options:

- `-bumpPitch` for checking the center-to-center pitch between bumps. The bumps that have a smaller center-to-center distance than the specified *`pitch_value`* are marked as spacing violations.
- `-bumpMaxPitch` for checking whether the center-to-center pitch between neighboring bumps violates the maximum spacing constraint.
- `-bumpToEdgePitch` for checking the pitch from the bump center to the guard or die edge.
- `-bumpToPinPitch` for checking the pitch between bump and pins of hard macros. The bumps and instance pin pairs that have a smaller bump_center-to-pin_center or bump_center-to-specified_pin_geometry_location distance than the *`pitch_value`* are marked as spacing violations.

In all these cases, bumps that violate the pitch request are marked as spacing violations and can be checked using the Violation Browser.

Bump-to-Bump Pitch Checking

For bump to bump pitch checking, the center-to-center bump pitch is needed. The center of a bump is calculated using the bump cell geometry at the topmost RDL layer.



Note: Only bump cell with single geometry at one RDL layer is supported. For multiple-layer bump cell, the topmost layer in the bump cell is the topmost RDL layer. If no geometry is defined at that layer, the geometry on the second topmost layer is used and a warning is issued:

No geometry at XX layer found; the geometry at XXX layer is used for bump center calculation.

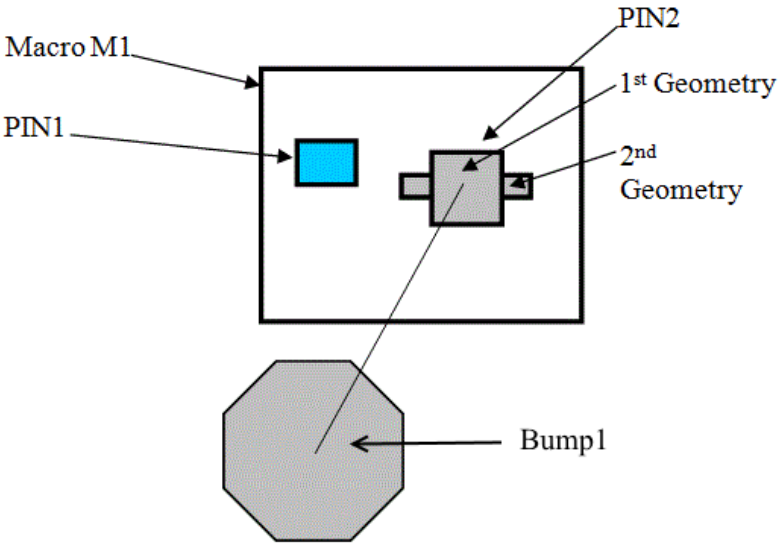
If the check is between a multiple-layer bump and a single-layer bump, the center is calculated using the geometries on the topmost layer in each cell. For example, in the following diagram, center-to-center pitch between `Bump1` and `Bump2` is calculated using the geometries on the top metal in `Bump1` and the second top metal layer in `Bump2`.

If there is no common layer in two bumps, there is no center-to-center pitch to be checked. For example, there is no violation to be reported for `Bump2` and `Bump3` in the above diagram.

Bump-to-Pin Pitch Checking

In some designs with IP macros, bumps have already been embedded inside the macro and are considered as macro pins. In this case, `checkBump` checks pitch between the bump center and the pin center. Bump center is defined in the same way as in the bump-to-bump case. Pin center calculation for pitch checking can vary as follows:

- Pin has multiple geometries on common layer
  `checkBump` selects all geometries of the pin if its layer is equal to bump's layer. For example, if bump only has topmost geometry, `checkBump` selects all the geometries on the topmost layer for pin. If the bump has both topmost and second layer geometry, `checkBump` selects the geometries for both layers. If no valid geometry of pin is found, `checkBump` skips the pin pitch checking for that pin.
  In the example below, the tool checks one by one the pitch for each geometry of `PIN2` on `Bump1`'s layer to see if there is a violation. That is, `checkBump` calculates the distance from the center of 1st geometry of `PIN2` to the center of `Bump1`. Then, it calculates distance from the center of 2nd geometry of `PIN2` to center of `Bump1`. For each check, `checkBump` reports a violation if the distance is less than `100`.
  ```
  checkBump -bumpToPinPitch {100 {Bump1 M1/PIN2}}
  ```



- Pin has multiple geometries and a particular geometry location is specified
  In case of multiple geometries, `checkBump` allows you to specify a location `[ pin_x pin_y ]`. If this location overlaps with a geometry, the pitch to this geometry is checked. `checkBump` calculates the distance from the center of this geometry to the bump center.

Note: `checkBump` does not support pin-to-pin pitch checking because such violations can only be fixed at LEF level which is beyond the flipchip tool capability. So in the following command:

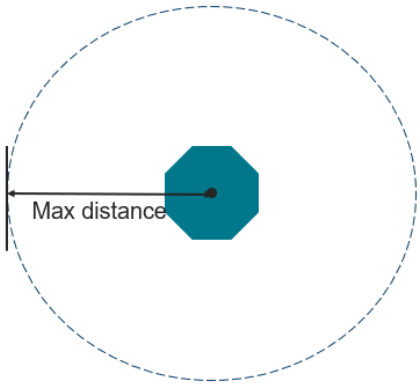
```
checkBump -bumpToPinPitch {100 {Bump1 M1/PIN1 M1/PIN2}}
```

`checkBump` checks `Bump1` and `M1/PIN1`; and `Bump1` and `M1/PIN2`; but not `M1/PIN1` and `M1/PIN2`.

Parameters

`-help`	Prints a brief description that includes type and default information for each `checkBump` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man checkBump`
`-area {x1 y1 x2 y2}`	Checks constraints for the bumps in the specific area. The unit is microns. The bumps selected by `-area` should be the same as the ones selected by the command `windowSelect`. If `-area` is used with `-bumpPitch`, `checkBump` checks the bump pitch only for the bumps in the specific area. If `-area` is specified without `-bumpPitch`, `checkBump` performs the default checks for the bumps in the specific area. **Note:** This parameter cannot be used with with `-bumpToPinPitch` or `-selected`.
`-bumpMaxPitch max_pitch_value`	

Checks whether the center-to-center pitch between neighboring bumps exceeds the *max_pitch_value*, which is specified in microns. For any bump, the search area is defined by a circle with a radius of *max_pitch_value* and the bump center as its center.

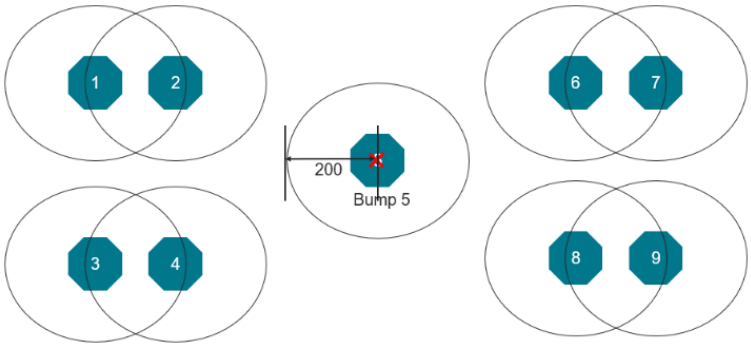


Search Area

If another bump is detected within a bump's search area, the bump is DRC free. If no other bump is detected in a bump's search area, the bump is marked with a maximum spacing violation and a warning message is displayed.

In the example below, only Bump 5 violates the maximum spacing constraint and is flagged with a maximum spacing violation:

```
checkBump -bumpMaxPitch 200
```



The `-bumpMaxPitch` parameter works on:

- all bumps in the design by default.
- selected bumps if `-selected` is specified.
- bumps in a specific area if `-area` is specified.
- same-net bumps if `-nets` is specified.

Note: The `-bumpMaxPitch` parameter cannot be specified along with the `-bumpPitch` or the `-bumpToEdgePitch` parameter.

`-bumpPitch {`*pitch_value* `[`*bump_name*`]}`

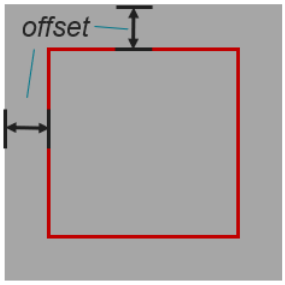
	Checks the center-to-center pitch between bumps. Here: • *pitch_value* represents the center-to-center pitch value in microns. • *bump_name* is the name of the bump. You can check pitch between two or more bumps. Wildcards can be used to specify bump names. If more than two bumps are specified, bump pitch is checked for all possible pairings. In the following example, checkBump checks center-to-center pitch between B1 and B2; B1 and B3; B2 and B3: `checkBump -bumpPitch {100 {B1 B2 B3}}` Any illegal pitch is logged as "Bump pitch between B1 and B2 XX < 100." Specifying bump names is optional. If bump names are specified, -bumpPitch works on the specified bumps. If bump names are not specified, -bumpPitch works on: ◦ selected bumps if -selected is specified. ◦ bumps in a specific area if -area is specified. ◦ all bumps in the design, if neither -selected nor -area is specified. **Note:** You can specify pitch checking multiple times in this option.
-bumpToEdgePitch *pitch_value*	
	Checks whether the pitch from the bump center to the guard or die edge is within the specified pitch value. If the detected pitch is less than the specified value, a warning is displayed and the bump is flagged with a spacing violation. *pitch_value* is specified in microns. By default, if -bumpToEdgePitch is specified, the tool checks the pitch from the bump center to the die edge. You can additionally specify -edgeOffset with this parameter to define a guard shape. If -edgeOffset is specified, the tool checks the distance from the bump center to the guard edge defined by -edgeOffset. If the bump center is outside the guard edge, the center-to-guard pitch will be a negative number, which is not allowed. The tool issues a warning in such cases. Check the **Examples** section to see how the -bumpToEdgePitch parameter can be used. The -bumpToEdgePitch parameter works on: • all bumps in the design by default. • selected bumps if -selected is specified. • bumps in a specific area if -area is specified. • bumps with specific nets if -nets is specified. **Note**: The -bumpToEdgePitch parameter cannot be specified along with the -bumpPitch or the -bumpMaxPitch parameter.
-bumpToPinOverlap *inst+*	

	Checks if the bump overlaps with the pins of the specified block. If the bump shape and the block pins are at the same location but on different layers, the tool does not consider them to be overlapping. However, if the bump shapes and the block pins are at the same location and on the same layer, they are reported as overlapping. The `-bumpToPinOverlap` parameter works on: • all bumps, by default. • selected bumps, if `-selected` is specified. • bumps in the specified area, if `-area` is specified. • bumps with the specified nets, if `-net` is specified. *`inst+`* should be of type block. Overwise, the tool reports an error.
`-bumpToPinPitch {`*`pitch_value`* `{[`*`bump_name`*`][`*`inst_pin_name`* `[`*`pin_x pin_y`*`]]}}`	
	Checks the center-to-center pitch between bumps and pins of hard macros. Here: • *`pitch_value`* represents the center-to-center pitch value in microns. • *`bump_name`* is the name of the bump. • *`inst_pin_name`* is the name of the instance pin. • *`pin_x`* and *`pin_y`* specify the pin geometry. **Note**: You can specify pitch checking multiple times in this option. Wildcards can be used in bump and pin names.
`-edgeOffset {`*`offset`* `[`*`cornerOffset`*`]}`	

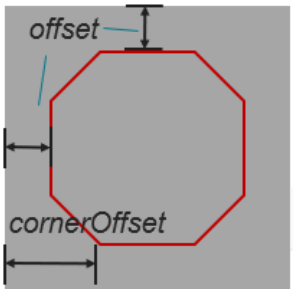
Defines the guard shape if it is different from the die boundary. The `-edgeOffset` parameter can be used only if the `-bumpToEdgePitch` parameter is specified.

You can specify either one or two values with the `-edgeOffset` parameter:

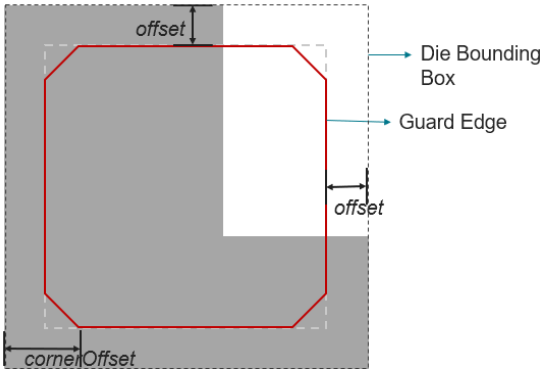
- If only one value (*`offset`*) is specified, the guard edge shape is a rectangle with the die boundary to guard edge distance being equal to the specified `offset` value.



- If two values (*`offset`* and *`cornerOffset`*) are specified, the guard edge shape is an octagon with 45-degree exterior angles. Here, the guard edge to the die boundary distance is the specified *`offset`* value and the distance from the die boundary to the lower-left point of the guard edge is the specified *`cornerOffset`* value.



In a rectilinear design, you can use the bounding box of the die as a reference for specifying the offset for the guard edge.



`-nets net+`	Checks constraints for the bumps with the specified nets. If `-bumpMaxPitch` is specified along with `-nets`, the tool checks for the maximum pitch constraint only between bumps belonging to the same net. For instance, in the example given below, if you specify the command `checkBump -bumpMaxPitch 300 -nets {VDD VSS}`, the tool checks: • Checks the `VDD Pitch1` between bump1 and bump3, `VDD Pitch2` between bump3 and bump4, and `VDD pitch3` between bump4 and bump6 • Checks the `VSS Pitch` between bump2 and bump5.  If `-bumpMaxPitch` is not specified, the tool performs default checks for the bumps with the specified nets. **Note**: The `-nets` parameter cannot be used along with the `-bumpToPinPitch` or `-relative_type` parameter.
`-onBumpGrid`	Checks if the bumps are on bump grids. This option cannot be used with any of the other parameters, except `-onBumpGridTolerance` and `-outfile`. The command errors out in the following cases: • If there is no bump grid in the DB - In this case, use the `create_bump_grid` command to create a bump grid. • If there are multiple bump grids on a single layer The command reports an error but keeps checking in the following case: • If there are multiple bump grids in different layers for one bump Warnings are reported in the following cases: • If there is no bump grid on the bump's layer • If a bump is off the bump grid - The bump is also marked with a DRC marker.
`-onBumpGridTolerance bump_grid_name value`	

	Specifies the tolerance value to be used when checking if bumps are on the specified bump grid. If this parameter is specified, the tool checks the Euclidean distance between the bump center and the specified grid and reports a violation only if the distance is more than the specified tolerance value. ⚠ • The `-onBumpGridTolerance` option can be specified only when `-onBumpGrid` is specified. • The value specified with `-onBumpGridTolerance` should be smaller than half of the Euclidean distance between two diagonal bump grid points. That is: $value < \frac{\sqrt{(bump_grid_pitch_x)^2+(bump_grid_pitch_y)^2}}{2}$ Otherwise, no violation can be reported.
`-outfile` *fileName*	Specifies the report filename. If no filename is specified, the report is printed to the console window.

`-relative_assignment`	Checks whether the net assignment of the target bump is equivalent to corresponding relative object. If not, it issues an error message and places a violation marker at the geometry center of the target bumps:
	• For `-relative_type embedded bump`, the following error message is displayed:
	`The assignment of $bump $net is not connected to the pin of the relative object $blockName/$pinName $expectedNet.`
	• For `-relative_type inst_pin_port`, the following error message is displayed:
	If `-relative_type` is specified as `embedded_bump` and there is no bump in the region being checked, `checkBump` does not check further for relative assignment and issues the following error message:
	`There is no bump overlapping with the relative object $blockName/$pinName located at {x2 y2} with relative offset {x y}. So stop checking the relative assignment for this relative object.`
	Note: This option can be used only if `-relative_type` is specified.

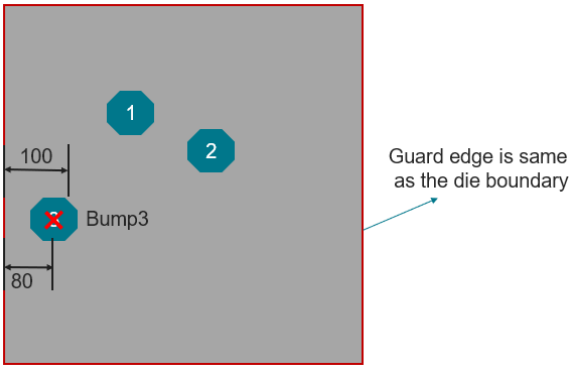
`-relative_object {`*inst_pin_port_list*`}`	

	Specifies the inst_pin_port list and supports wild cards. The format is `{inst:pin:port ...}` and `port` is of type integer. If `-relative_object` is specified, `checkBump` checks whether the geometry center of the target bumps is at the same location as the geometry center of the specified port. If not, it issues an error message and places a violation marker on the geometry center of the target bumps. In addition: • If no bump overlaps with the specified port, `checkBump` displays the message that there are no bumps in the design overlapping with the specified port. • If the specified ports do not exist, an error message is displayed. **Note**: When used with `-selected` or `-area`, the `relative_object` option works only on the specified bumps by selection or area.
`-relative_offset x y`	Specifies the offset of bump location compared with the corresponding relative object. This option can be used only if `-relative_type` is specified. *Default*: `{0 0}`
`-relative_type {embedded_bump inst_pin_port}`	
	Specifies the type of relative object: • `embedded_bump`: If this option is specified, `checkBump` checks whether the geometry center of the target bumps is at the same location as the geometry center of the overlapping embedded bumps. If not, it issues an error message and places a violation marker on the geometry center of the target bumps. In addition: ◦ If no bump overlaps with the embedded bumps, `checkBump` displays an error message as follows: `There is no bump overlapping with the relative object $blockName/$pinName located at {x2 y2} with relative offset {x y}.` ◦ If more than one bump is located at the region being checked, all bumps violating the embedded bump are reported. A summary of the number of the bumps violating the embedded bump is displayed. Violation markers are placed on the embedded bump as well as the bumps violating the embedded bump. The violations can be viewed in Violation Browser. ◦ If there are no embedded bumps, an error message is displayed. **Note**: As this check happens on the entire design, you cannot use the `-selected` or `-area` options if `-relative_type embedded_bump` is specified. • `inst_pin_port`: If the type is `inst_pin_port`, you must specify the `-relative_object {inst_pin_port_list}` option.
`-resetViolationMarker`	
	Resets violation markers.
`-select_violation_bumps`	
	Selects automatically all the bumps that are violating any check rules.

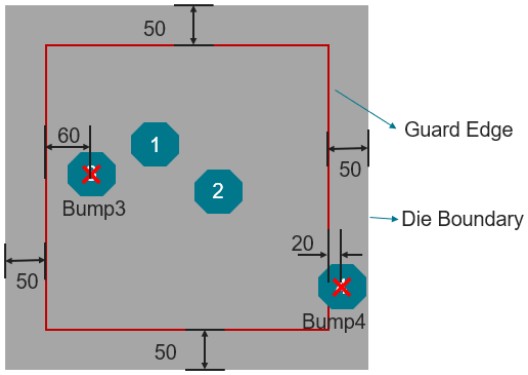
`-selected`	Checks constraints for selected bumps. If `-selected` is used with `-bumpPitch`, `checkBump` checks the bump pitch only for the selected bumps. If `-selected` is specified without `-bumpPitch`, `checkBump` performs the default checks for the selected bumps. **Note**: This parameter cannot be used with with `-bumpToPinPitch` or `-area`.

Example

- The following command checks the center-to-center pitch for all bumps. If the center-to-center distance between two bumps is smaller than 100, it reports a violation:
  ```
  checkBump -bumpPitch 100
  ```
- The following command checks the center-to-center pitch between bump_1 and bump_2:
  ```
  checkBump -bumpPitch {100 {bump_1 bump_2}}
  ```
- The following command checks the center-to-center pitch for the selected bumps:
  ```
  checkBump -bumpPitch 100 -selected
  ```
- The following command checks the center-to-center pitch for bumps in the specified area:
  ```
  checkBump -bumpPitch 100 -area {100 400 600 900}
  ```
- The following command checks whether the bump center to die edge pitch is less than 100 microns:
  ```
  checkBump -bumpToEdgePitch 100
  ```
  In the design below, Bump3 is flagged with a spacing violation and a warning message is displayed:

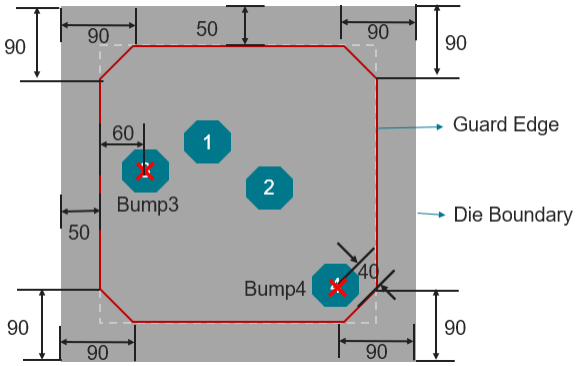
- The following command checks whether the bump center to guard edge pitch is less than 100 microns. The guard edge is offset from the die boundary by 50 microns:
  ```
  checkBump -bumpToEdgePitch 100 -edgeOffset 50
  ```
  In the design below, Bump3 and Bump4 are flagged with spacing violations and warnings are displayed:



- The following command checks whether the bump center to guard edge pitch is less than 100 microns. The guard edge is offset from the die boundary by 50 microns and the guard corners are offset by 90 microns:

  ```
  checkBump -bumpToEdgePitch 100 -edgeOffset {50 90}
  ```

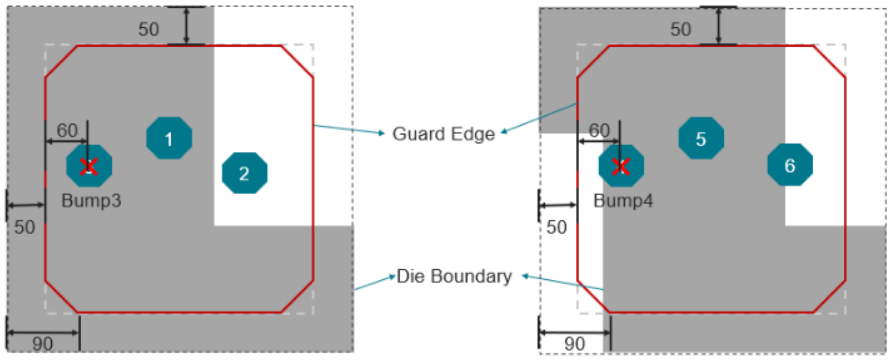
  In the design below, Bump3 and Bump4 are flagged with spacing violations and warnings are displayed:



- The following command checks whether the bump center to guard edge pitch is less than 100 microns. The guard edge is offset from the die boundary by 50 microns and the guard corners are offset by 90 microns:

  ```
  checkBump -bumpToEdgePitch 100 -edgeOffset {50 90}
  ```

  In the rectilinear designs below, Bump3 and Bump4 are flagged with spacing violations and warnings are displayed. However, Bumps2 and Bump6 are DRC free even though they are outside the die boundary because they are still within the guard shape:



- The following command checks the bump assignment and sends the report to `test.rpt`:

  ```
  checkBump -outfile test.rpt
  ```

  A sample report file is as follows:

  ```

ciopLoadBumpColorMapFile

```
ciopLoadBumpColorMapFile
[-help]
bumpColorFile
```

Loads the bump color map file to change the color of assigned bumps. The command supports all the colors specified in the Qt color table. A list of recognized color names can be found at `http://www.w3.org/TR/SVG/types.html#ColorKeywords`.

The bump color map file supports wildcards for ease of use. For example, instead of specifying `tdigit[1] green`, `tdigit[2] green` and so on, you can specify `tdigit* green` in the bump color map file to color all `tdigit` bumps green.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `ciopLoadBumpColorMapFile` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man ciopLoadBumpColorMapFile`
`bumpColorFile`	Specifies the name of the bump color map file to load.

Example

- The following command loads the bump color map file `BumpColor.Map` and assigns colors to bumps in the design:

  ```
  ciopLoadBumpColorMapFile BumpColor.Map
  ```

  Output:

  ```
  port_pad_data_out[8] wheat
  tdigit* green
  ```

Related Information

- `assignBump`

copy_bump

```
copy_bump
[-help]
[-assigned]
[-name_format {format}]
-shift {X Y}
{-bumps {bump_list} | -selected }
```

Copies bumps to the specified location with the same pitch constraint. By default, the target bumps after copy are unassigned and named with the default format `Bump_%i` by the tool. Here, `%i` refers to the index of the bump, which starts at one more than the number of existing bumps in the design. Use the option `-name_format` to name the copied bumps. If there are any name collisions, an error is given and the bumps are not copied.

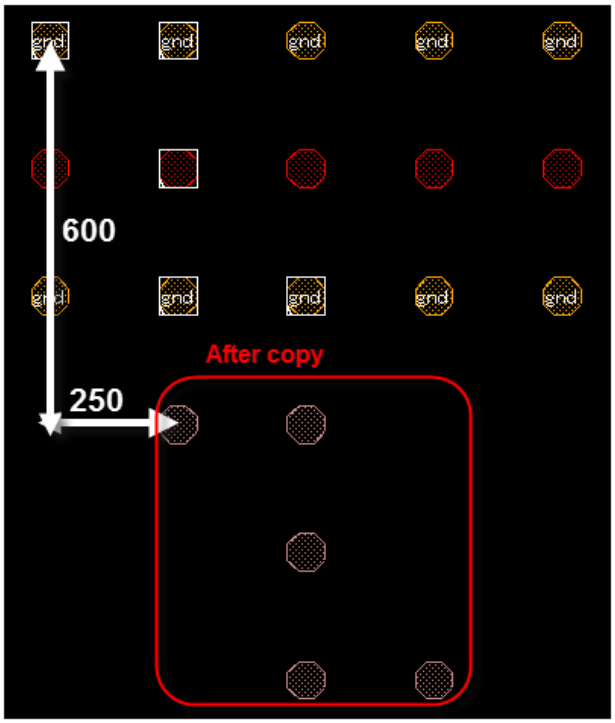
Parameters

`-help`	Prints a brief description that includes type and default information for each `copy_bump` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man copy_bump`
`-assigned`	Copies the bumps and their assigned signals.
`-bumps {`*`bump_list`*`}`	Specifies names of the bumps to be copied. You can use wildcards in the bump list.
`-name_format {`*`format`*`}`	
	Specifies the name format for the target bumps. The format is similar to the `printf` format, except that it uses `%i` for index and `%o` for original name of source bump. `%i` mean the index of bump, which starts at one more than the number of existing bumps in the design.
`-selected`	Copies only the selected bumps.
`-shift {X Y}`	Specifies the distance in microns from the source location to the target location in X/Y direction

Examples

- The following command copies the selected bumps, `Bump_1` to `Bump_5`, and pastes them with a `{250 -600}` shift. The copied bumps are named `Bump_1_copy`, `Bump_2_copy`, and so on.

  ```
  copy_bump -selected -shift {250 -600}  -name_format {%o_copy}
  ```



- Assuming that the number of bumps in the design is `15`, the following command copies the selected bumps, `Bump_1` to `Bump_5`, and pastes them with a `{250 -600}` shift. The copied bumps are named `Bump_1_copy_16`, `Bump_2_copy_17`, ..., and `Bump_5_copy_20`:

  ```
  copy_bump -selected -shift {250 -600} -name_format {%o_copy_%i}
  ```

- Assuming that the number of bumps in the design is `15`, the following command copies the selected bumps, `Bump_1` to `Bump_5`, and pastes them with a `{250 -600}` shift. The copied bumps are named `Bump_16`, `Bump_17`, ..., and `Bump_20`, according to the default name format:

  ```
  copy_bump -selected -shift {250 -600}
  ```

create_bump

```
create_bump
[-help]
[-allow_outside_of_die]
[-allow_overlap_control {keep_all keep_existing_bumps keep_new_bumps}]
-cell bumpcell_name
[-check_drc]
[-edge_spacing {left bottom right top}]
[-exclude_bump_area {rect_list}]
[ [-keep_out_region width height] | [-keep_out_pitch value] ]
[-loc x y]
[-loc_type {cell_center | cell_lowerleft | geometry_center | geometry_lowerleft}]
[-name_format {string, %i, %r, %c}]
[-orientation {R0 R90 R180 R270 MX MX90 MY MY90}]
[-respect_placement_blockage]
[-return_bumps_name]
[-start_index index]
[-pitch x y [-pattern_full_chip | -pattern_side {side width} | -pattern_array {row column} | -pattern_ring width | -
pattern_center {row column}]]
[-stagger_type type [-stagger_offset value]]
[-relative_type {embedded_bump inst_pin_port block}
  [[-relative_object {inst_pin_port_list}]
   [-relative_block inst+] [-relative_block_constraint fileName]
   [-relative_assignment] [-relative_offset x y]]]
[{-pattern_full_chip  | -pattern_array {row column} | -pattern_center {row column}} [-start_from {lower_left
upper_left lower_right upper_right}]]
```

Creates bumps and instances of bump cells based on the specified pattern. Use one of the following parameters to specify the bump pattern in the chip:

- `-pattern_full_chip`
- `-pattern_side {side width}`
- `-pattern_array {row column}`
- `-pattern_ring width`
- `-pattern_center {row column}`

If none of the above patterns is specified, `create_bump` creates a single bump at the specified location.

`create_bump` also enables you to create bumps based on pin location.

Note - During bump placement trials, if you click the *Undo* button (or use the `undo` command) after running `create_bump`, the bump floorplan will return to the state it was in before `create_bump`. If you then click the *Redo* button (or use the `redo` command), the bump floorplan will reapply the changes made by `create_bump`.

Embedded Bumps

Bumps are usually placed in the top design. However, some blocks may also include bumps. Such bumps are called embedded bumps. When implementing the block design, use the following special keywords in the LEF definition for embedded bumps.

- Add following property keywords in the head of tech LEF file

```
PROPERTYDEFINITION
    LAYER LEF58_TYPE STRING ;
END PROPERTYDEFINITIONS
```

- Add PASSIV LAYER definition after AP(top) layer

```
LAYER PASSIV
  TYPE CUT ;
  PROPERTY LEF58_TYPE "TYPE PASSIVATION ; " ;
END PASSIV
```

- Add a same geometry on PASSIV layers with the bump pins

```
MACRO BUMP
CLASS COVER BUMP ;
  …
    PIN A
  …
      PORT
        LAYER PASSIV ;
        POLYGON 27.985 0 67.565 0 95.55 27.985 95.55 67.565 67.565 95.55 27.985 95.55 0 67.565 0 27.985 ;
        LAYER AP ;
        POLYGON 27.985 0 67.565 0 95.55 27.985 95.55 67.565 67.565 95.55 27.985 95.55 0 67.565 0 27.985 ;
      END
    END A
  END BUMP
```

After the block design is finished, the bumps are dumped out as one port of the pin with PASSIV layer and top layer (AP) as similar as below, tool could check if the port is the embedded bump by PASSIV layer from the top design.

```
PIN DQ0
    DIRECTION INOUT ;
    USE SIGNAL ;
    PORT
      LAYER AP ;
      POLYGON 759.9810 366.7830 799.5610 366.7830
              827.5460 338.7980 827.5460 299.2180
              799.5610 271.2330 759.9810 271.2330
              731.9960 299.2180 731.9960 338.7980 ;
      LAYER PASSIV ;
      POLYGON 759.9810 366.7830 799.5610 366.7830
              827.5460 338.7980 827.5460 299.2180
              799.5610 271.2330 759.9810 271.2330
              731.9960 299.2180 731.9960 338.7980 ;
END
    PORT
…
END
…
END DQ0
```

If you are creating an embedded bump, `create_bump` automatically creates a bump in the top design with the correct net assignment at the same location as the embedded bump.

Dummy Bumps

You can also use `create_bump` to create mechanical dummy bump cells without pin shapes. For details, see the Dummy Bump Creation section in the *Innovus User Guide*.

Parameters

`-help`	Prints a brief description that includes type and default information for each `create_bump` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man create_bump`
`-allow_outside_of_die`	Allows bumps to be created outside of die area. When this option is specified, the tool ignores floorplan constraints when creating a bump array pattern. This option can be used only if `-pattern_array` and `-location` are also specified. *Data_type*: bool, optional
`-allow_overlap_control {keep_all keep_existing_bumps keep_new_bumps}`	

	Specifies the overlap control type. The allowed values for the `-allow_overlap_control` parameter are: • `keep_all` - Keeps all overlapping bumps. • `keep_existing_bumps` - Keeps the existing bumps before calling `create_bump` if there is an overlap. If this option is specified, `create_bump` skips creating a bump if there is an overlap and continues creating the remaining bumps. A warning message is displayed when bump creation is skipped to avoid overlap. • `keep_new_bumps` - Removes the existing bumps before calling `create_bump`, places the newly created bump if there is overlap, and then continues creating the remaining bumps. A warning message is displayed when deleting the existing bumps to avoid overlap. If the status of the existing bumps to be deleted is covered or fixed, a warning is displayed and the new bumps overlapping with the covered or fixed old bumps are not kept. ⚠ `create_bump`: • Checks overlaps between regular bumps by checking for pin overlaps on bumps. • Checks overlaps between dummy bumps by checking for OBS overlap. • Checks overlaps between dummy bumps and regular bumps by checking for OBS and bump pin overlap.

`-check_drc`	Checks DRC rules and does not create a bump at any location where there is a violation. A suitable warning message is also issued. For example, as indicated in the following diagram, no bump is created at the location where a short violation is detected when `-check_drc` is specified with `create_bump`.  In addition, a warning such as the following is displayed: `**WARN: (IMPSIP-9068): New bump at (0.000, 75.000) has short violation and skipped.` Currently, `create_bump -check_drc` checks for the following types of violations: • Short violation • Min spacing violation • Cut spacing violation • EOL (end of line) violation
`-cell` *`bumpcell_name`*	Specifies the name of the bump cell, which is used to create bumps.
`-edge_spacing {`*`left bottom right top`*`}`	
	Specifies the minimum distances in microns to the edge of the chip from the lower left or center of the outermost bumps. The `-loc_type` value determines which point of the bump (lower-left or center of the cell or geometry) is used to compute the distance to the edge. The arrays start at the left, bottom location and extend to the right and top.
`-exclude_bump_area {`*`rect_list`*`}`	
	Specifies the area to be excluded from bump placement. No bump geometry is allowed inside the specified area. It supports multiple rectangles, such as `-exclude_bump_area {`*`llx1 lly1 urx1 ury1 llx2 lly2 urx2 ury2 ...`*`}`.

`-keep_out_pitch value`	Defines a circular keep-out area with the bump center as the center and the specified pitch value as the radius. By default, the tool will not create a bump at a location if an existing bump violates the center-to-center pitch at that location, as shown below.  Expected bump creation If the bump-center-to-bump-center pitch at a location is smaller than the specified keep-out pitch value, the tool displays a warning. Whether the tool then retains the existing bumps in the overlap region or replaces them with the new bumps depends on the `-allow_overlap_control` parameter setting: • If `-keep_out_pitch` is specified but `-allow_overlap_control` is not specified, the tool keeps the existing bumps and does not add new bumps in the overlap region. This is the same behavior as when `-keep_out_pitch` is specified along with `-allow_overlap_control keep_existing_bumps`. • If `-keep_out_pitch` is specified along with `-allow_overlap_control keep_new_bumps`, the tool keeps the newly added bumps and deletes the existing bumps. If the bump-center-to-bump-center pitch equals the specified keep-out pitch value, the tool creates bumps without any violations.
`-keep_out_region width height`	
	Defines a dynamic, keep-out region where bumps are not going to be created if there are existing bumps in that region. The keep-out region is a box area of the specified width and height, and its center is the same as the bump center. By default, if you specify `-keep_out_region` and there are existing bumps in the region, the tool displays a warning and keeps the existing bumps in the overlap area. Specify `-allow_overlap_control keep_new_bumps` if you want to keep the new bumps and delete existing ones in the case of overlap in the specified keep-out region.

`-loc x y`	Specifies the *x* and *y* coordinates of the start point for bump creation based on location type. The unit is micron. For different bump patterns, the `-loc` coordinates have different meanings for the start point: • For `-pattern_full_chip`, `-pattern_side {bottom width}`, `-pattern_side {left width}`, `-pattern_array {row column}`, `-pattern_ring width`, the start point is the location of the lower-left bump in the bump pattern. • For `-pattern_side {top width}`, the start point is the location of the upper-left bump in the bump pattern. • For `-pattern_side {right width}`, the start point is the location of the lower-right bump in the bump pattern. • For `-pattern_center {row column}`, the start point is the center of the bump pattern. If the location violates the spacing rule defined by the option `-edge_spacing`, the tool issues a warning but still uses the `-loc` value for the start point.
`-loc_type {cell_center | cell_lowerleft | geometry_center | geometry_lowerleft}`	
	Specifies the location type for bump creation. The default type is `cell_center`.
`-name_format {string, %i, %r, %c}`	
	Specifies the format for the bump name like a `printf` format, except that it uses `%i` for index, `%r` for row number, and `%c` for column number. The index starts at one more than the number of existing bumps in the design, unless `-start_index` is specified and increments for each bump created. This means if there are no bumps in the design, the index starts at `1` and if there are 100 bumps in the design, the index starts at 101. The default name format is `Bump_%i`. Therefore, if there are no bumps in the design, the tool generates bumps named `Bump_1`, `Bump_2`, and so on, by default. Some examples of the possible format are: • `-name_format prefix_%i_string_%r_%c_suffix` • `-name_format %i` • `-name_format bumpname` If there are any name collisions, an ERROR occurs and the bump pattern is not created.
`-orientation {R0 R90 R180 R270 MX MX90 MY MY90}`	

	Specifies the orientation of the bump for bump generation. Use this option if you are creating a pillar bump. A pillar bump can be rectangular and you may rotate the pillar bump by 90/180/270 degrees to alleviate package and chip routing problem. *Default:* `R0` **Note**: If you are creating a regular C4 bump, which is either octagonal or square in shape, rotation does not change its footprint in silicon.
`-pattern_array {`*`row column`*`}`	
	Creates an array of bumps. The bump starts at the coordinates specified with `-loc`, and extends to the number of *`row`* and *`column`* values given from the start corner specified using `-start_from`.
`-pattern_center {`*`row column`*`}`	
	Creates an array of bumps that is centered on the center of the chip and that extends for the *`row`* and *`column`* values given. The center point can optionally be set directly with `-loc`. The starting corner of the array can be specified using the `-start_from` parameter.
`-pattern_full_chip`	Creates an array of bumps covering the chip. The array starts at the closest to boundary point set by `-edge_spacing` at the corner specified by `-start_from` and extends until within `-edge_spacing` of the chip boundary for the opposite sides. You can optionally directly specify the `-loc` value for the starting point, in which case `-edge_spacing` affects only the two opposite edges of the array. For examples, see the Examples section below.
`-pattern_ring` *`width`*	Creates a ring of bumps around the boundary of the chip that is *`width`* bumps wide, where *`width`* is an integer value. The ring extends until within `-edge_spacing` of the chip boundary, starting at the lower-left value allowed by `-edge_spacing`. You can optionally directly specify the `-loc` value for the lower-left bump location, in which case `-edge_spacing` only affects the right and top edges of the array. The `-pitch` *`x`* value is the spacing between bumps inside one ring, and the `-pitch y` value is the spacing between two rings. For examples, see the Examples section below.
`-pattern_side {`*`side width`*`}`	
	Creates an array of bumps along one side of the chip. The array is the length of the side, and *`width`* bumps wide, where *`width`* is an integer value. The legal *`side`* names are: `left`, `top`, `right`, `bottom`. The array starts at the left/bottom controlled by `-edge_spacing`, and extends until within `-edge_spacing` of the top/right sides. You can optionally directly specify the `-loc` value for the lower-left bump location for bottom/left sides, the upper-left bump for the top side, or lower-right for the right side. For examples, see the **Examples** section below.

`-pitch x y`	Specifies the distance between bump centers in microns. `-pitch {x y}` is interpreted in different ways for different bump patterns.
	• For `full_chip`, bottom_side row, top_side row, left_side column, right_side column, array {row column}, and center {row column}:
	  ◦ `-pitch x` means the distance between the bump centers in a row or horizontal.
	  ◦ `-pitch y` means the distance between the bump centers in column or vertical.
	• For `ring ring_number`:
	  ◦ `-pitch x` means the distance between the bump centers in the ring.
	  ◦ `-pitch y` means the distance between rings from the bump center.

`-relative_assignment`	Assigns the corresponding net of the relative object to the bump being created. This option can be used only if `-relative_type` is specified. If `relative_assignment` is specified and `-relative_type` is: • `embedded_bump`: `create_bump` searches the top netlist for the net connected to the pin of the embedded bump and assigns it to the created bump. • `inst_pin_port`: You must also specify `-relative_object {inst_pin_port_list}`. `create_bump` then searches the top netlist for the net connected to the specified pin and assigns it to the created bump. • `block`: You must also specify `-relative_block {inst+}`. `create_bump` then searches the top netlist for the net connected to the top layer pins of the specified blocks and assigns it to the created bump. **Note**: This option is used with `-cell`, `-start_index`, `-name_format`, `-orientation`, `-allow_overlap_control`, `-relative_type`, `-relative_object` and `-relative_offset`. An error message is displayed if it is used with any other option.
`-relative_block inst+`	Specifies the block list for creating top-level bumps based on block pins on the top layer. The `-relative_block` parameter must be specified when `-relative_type` is set to `block`. The `-relative_block` parameter supports wildcards. For example, you can specify `-relative_block *`.
`-relative_block_constraint fileName`	

	Specifies the filename of the block constraint to be used for creating top-level bumps based on block pins on the top layer. The `-relative_block_constraint` parameter is optional and can be used only when `-relative_type block` is specified.
	
	`create_bump` parses the constraint file specified with `-relative_block_constraint` and creates bumps based on the instance pins specified with `-relative_block`. The top-level bump is created at the center of the block pin geometries. Note that bumps are created on a block pin only if it is on the top layer of a design.
	
	The constraint format for bumps based on a block pin is as follows:
	
	`BUMP_ON_BLOCK_PIN`
	
	`MACRO` *`marco_name_list`*
	
	`PIN [`*`pin_name_list`*`] [SINGLE|MULT]`
	
	`PORT [SINGLE|MULT]`
	
	`GEOMETRY_SHAPE RECT/POLY`
	
	`GEOMETRY_SHORT_EDGE` *`min_value`* `[:`*`max_value`*`]`
	
	`GEOMETRY_LONG_EDGE` *`min_value`* `[:`*`max_value`*`]`
	
	`NET` *`net_list_name`*
	
	`END BUMP_ON_BLOCK_PIN`
	
	Note: If a constraint file is specified, the tool creates bumps only on the block pins that are specified in the constraint file. If you do not specify a constraint file, the tool creates a single bump for each block pin on the top layer for the specified blocks. If a constraint file is specified but is empty, the tool does not create any bumps because no block pin is specified in the constraint file.
	
	To see the use model and examples of the `BUMP_ON_BLOCK_PIN` constraint, refer to the "Bump Creation" section in the Flip Chip Methodologies chapter in the *User Guide*.

`-relative_object {`*`inst_pin_port_list`*`}`	

	Specifies the inst_pin_port list and supports wild cards. The format is `{inst:pin:port ...}` and `port` is of type integer. When the `-relative_object` option is specified, bumps are created by default at the geometry center of the specified ports. The bump is named `$blockName-$pinName-Port_$portNumber-embeddedBump_$index`, where: • `$blockName` is the name of the block in the top design which has the corresponding embedded bump. • `$pinName` is the name of the pin in LEF which has the corresponding embedded bump. • `$portNumber` is the number of the port on which the created bump is based. **Example**: `Avd_test_1-DQ0-Port_1-embeddedBump_1` You can reset the default settings by using the `-start_index` and `-name_format` options. **Note**: This option is used with `-cell`, `-start_index`, `-name_format`, `-orientation`, `-allow_overlap_control`, `-relative_type`, `-relative_assignment` and `-relative_offset`. An error message is displayed if it is used with any other option.
`-relative_offset x y`	Specifies the offset of bump location compared with the relative object. The geometry center of the created bump is the geometry center of the relative object plus the offset. This option can be used only if `-relative_type` is specified. **Note**: This option is used with `-cell`, `-start_index`, `-name_format`, `-orientation`, `-allow_overlap_control`, `-relative_type`, `-relative_object` and `-relative_assignment`. An error message is displayed if it is used with any other option.
`-relative_type {embedded_bump inst_pin_port block}`	

	Specifies the type of the relative object: • `embedded_bump`: When the `embedded_bump` type is specified, `create_bump` automatically creates a bump at the same location as the embedded bump. The bump is named *`$blockName/$pinName/embeddedBump_$index`*, where: ◦ *`$blockName`* is the name of the block in the top design that has the corresponding embedded bump. ◦ *`$pinName`* is the name of the pin in LEF that has the corresponding embedded bump. You can reset the default settings by using the `-start_index` and `-name_format` options. If there are already overlapping bumps for some embedded bumps, `create_bump` skips creating bumps for those embedded bumps but continues to create bumps for remaining embedded bumps and issues the following warning message. `WARNING (#): There is(are) overlap bump(s) with the embedded bump $blockName/$pinName located at {x2 y2} with relative offset {x y}. Skip creating bump for it.` After all bumps are created, `checkBump` displays a summary of the number of embedded bumps for which the tool failed to create bumps. • `inst_pin_port`: When the `inst_pin_port` type is specified, `create_bump` creates bumps as per the *`inst_pin_port_list`* you specify with `-relative_object`. Therefore, if you specify `-relative_type` as `inst_pin_port`, you must specify the `-relative_object {`*`inst_pin_port_list`*`}` option. • `block`: When the `block` type is specified, `create_bump` automatically creates bumps at the same location as that of the specified block pin, which must be on the top routing layer of the design. The `-relative_block` parameter must be specified when `-relative_type` is set to `block`.
`-respect_placement_blockage`	Specifies that the bumps being created, including dummy bumps, should not overlap any placement blockages.
`-return_bumps_name`	Returns the names of the bumps generated. If `create_bump` fails to generate any bumps, the tool returns an empty string.
`-stagger_offset` *`value`*	Specifies the offset of bumps between rows or columns in the generated bump pattern. Its value is specified in microns. This option is used with `-stagger_type`.
`-stagger_type {odd_rows odd_columns even_rows even_columns trapezoid }`	

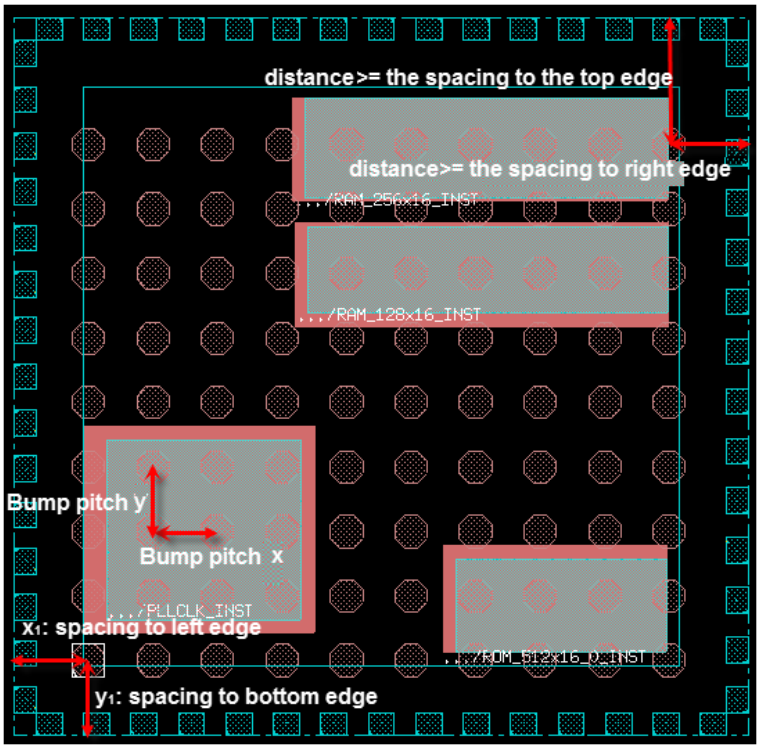
	Specifies the stagger type pattern. The `-stagger_type` parameter cannot be used with `-pattern_ring`. You can use the `-stagger_offset` parameter along with `-stagger_type` to specify the offset of bumps between rows or columns in the generated bump pattern. The allowed values for the `-stagger_type` parameter are: • `odd_rows` - Creates a bump array with the odd rows shifted to the right by the specified stagger offset value. • `odd_columns` - Creates a bump array with the odd columns shifted up by the specified stagger offset value. • `even_rows` - Creates a bump array with the even rows shifted to the right by the specified stagger offset value. • `even_columns` - Creates a bump array with the even columns shifted up by the specified stagger offset value. • `trapezoid` - Creates bumps are created in a trapezium pattern. This stagger type is supported only with `-pattern_side`.  For examples of how `-stagger_offset` affects different `-stagger_type` patterns, refer to the Examples section below.
`-start_from {lower_left upper_left lower_right upper_right}`	
	Specifies the starting corner for creating an array of bumps. This option can be used only if `-pattern_array`, `-pattern_center`, or `-pattern_full_chip` is specified. **Note**: Bumps are always indexed by row first, irrespective of the `-start_from` value. For examples of using `-start_from`, refer to the Examples section below. *Default*: `lower_left`
`-start_index` *index*	Specifies the starting number of the index for bumps to be created.

Examples

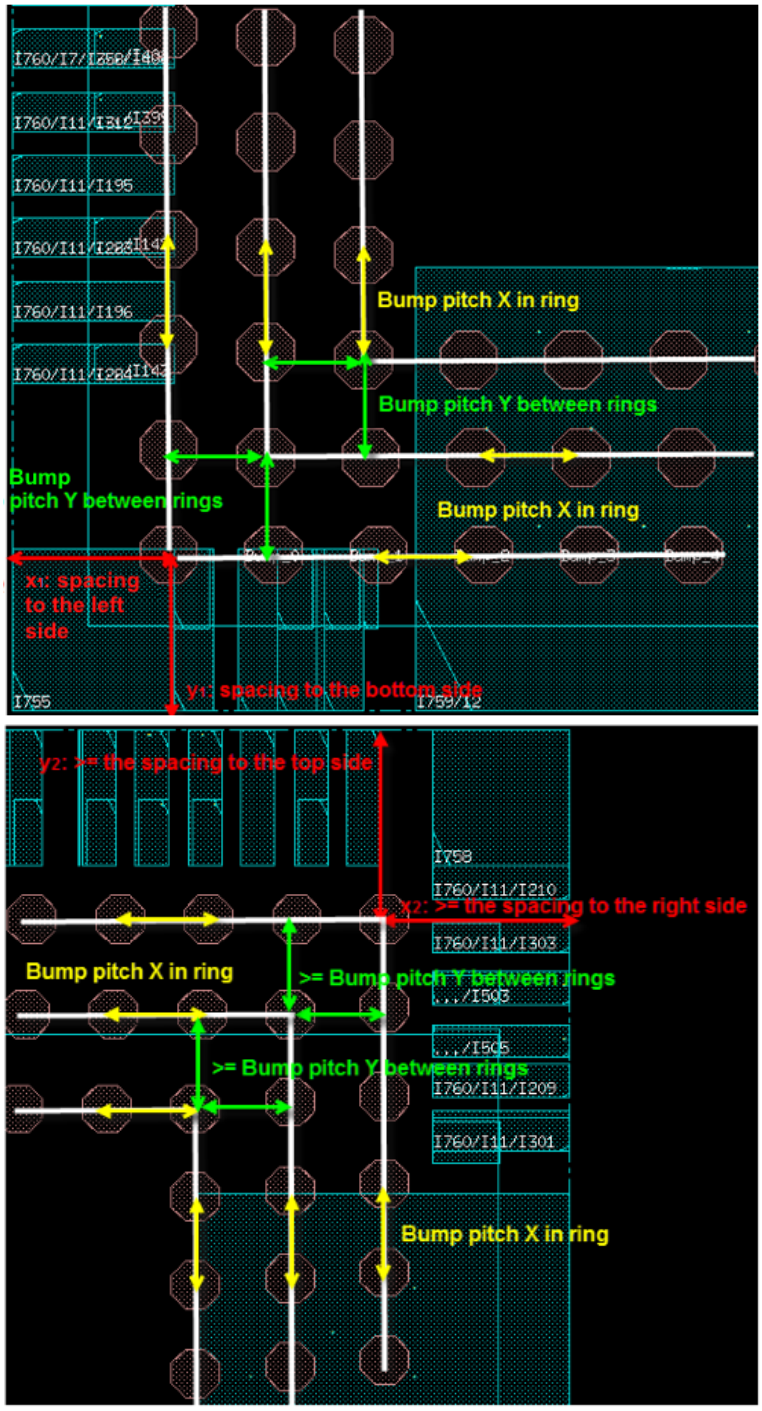
- The following command creates a single bump at the lower-left corner of the bump cell box:
  ```
  create_bump -cell BUMPCELL -loc_type cell_lowerleft -loc {0 0}
  ```
- The following command uses the default location type setting and creates an array of bumps with bump cell that has the same

size as the bump bounding box for the macro BUMPCELL.

```
create_bump -cell BUMPCELL -pitch {x y} -edge_spacing {x1 y1 x2 y2} -pattern_full_chip
```

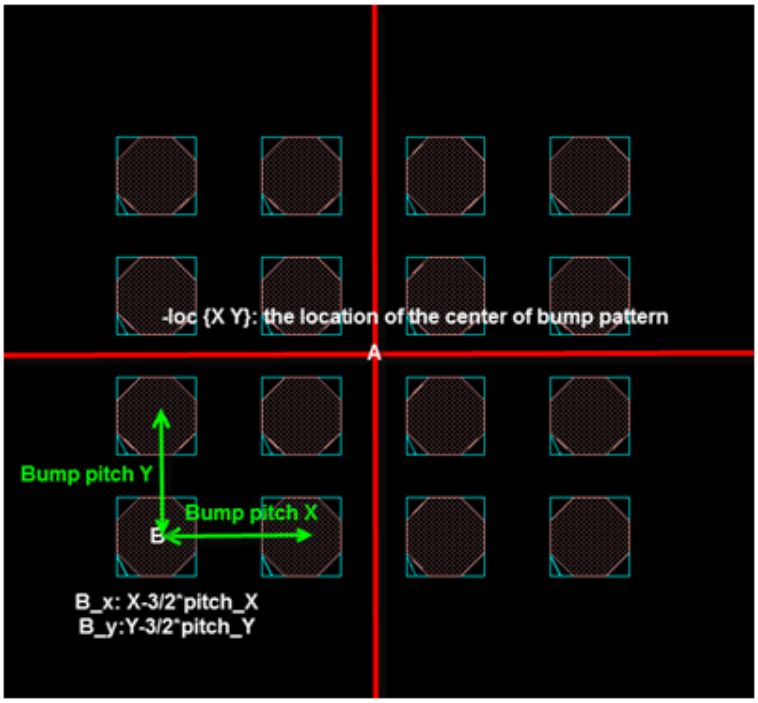


- The following command creates a full bump matrix on the chip with the spacing constraint {`400 500 450 600`} and bump pitch {`80 120`}. The names of the created bumps honor the default naming format `Bump_%i`, where `%i` means the index:
  ```
  create_bump -cell BUMPCELL -pitch {80 120} -edge_spacing {400 500 450 600} -pattern_full_chip
  ```
- The following command creates a ring of bumps around the boundary of the chip that is 3 bumps wide:
  ```
  create_bump -cell BUMPCELL -pitch {X Y} -edge_spacing {x1 y1 x2 y2} -pattern_ring 3
  ```

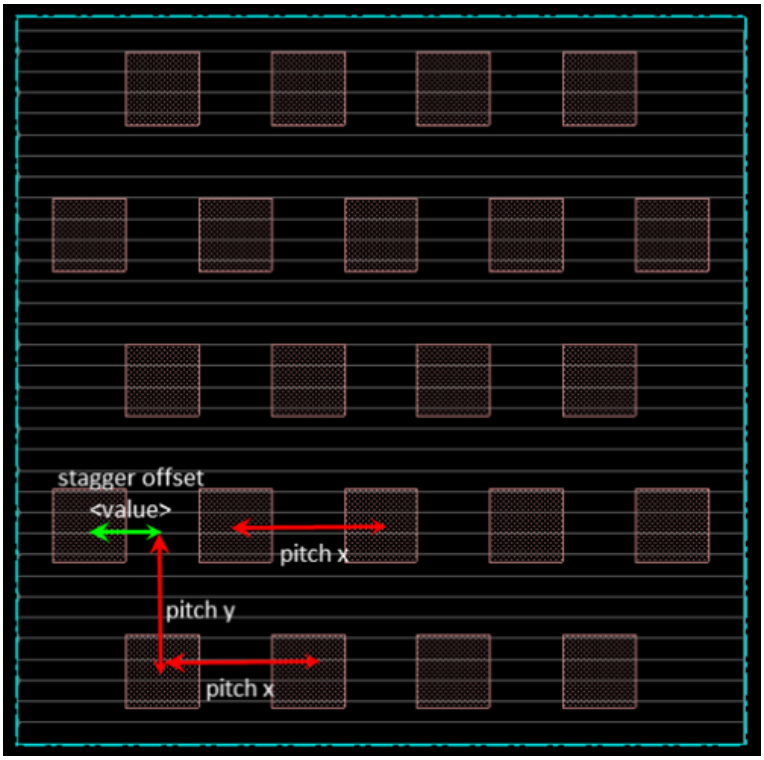


- The following command creates a 4x4 array of bumps that is centered on the point defined by `-loc`:

  ```
  create_bump -cell BUMPCELL -pitch {X Y} -loc {X Y} -pattern_center {4 4}
  ```

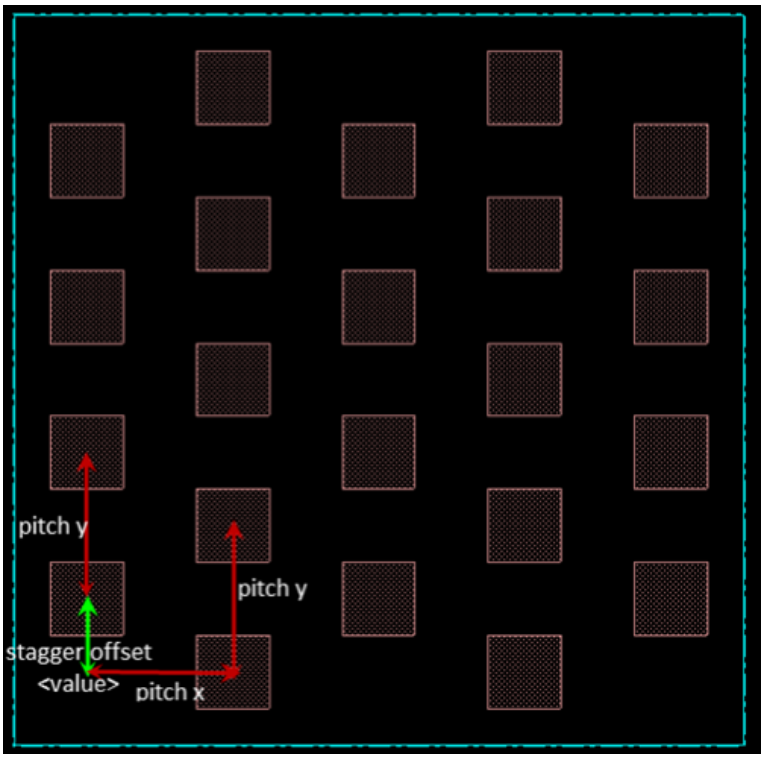


- The following example shows how `-stagger_offset` can be used to create a 5X5 array of bumps in `-stagger_type odd_rows` stagger pattern:
  `create_bump -cell BUMPCELL -loc{loc_x loc_y} -pitch {pitch_x pitch_y} -pattern_array {5 5} -stagger_type odd_rows -stagger_offset value`



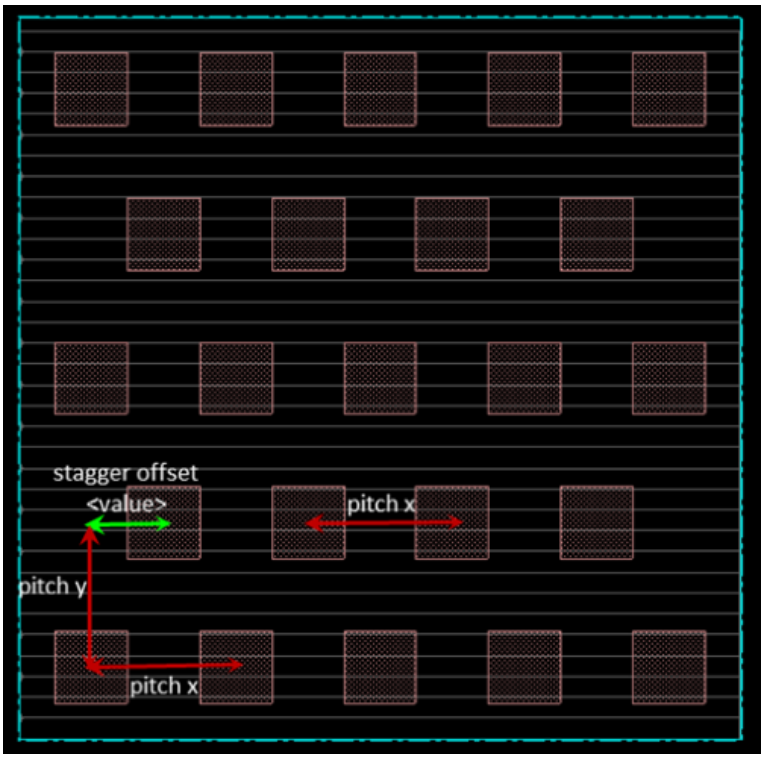
- The following example shows how `-stagger_offset` can be used to create a 5X5 array of bumps in `-stagger_type odd_columns` stagger pattern:

  `create_bump -cell BUMPCELL -loc{`*`loc_x loc_y`*`} -pitch {`*`pitch_x pitch_y`*`} -pattern_array {5 5} -stagger_type odd_columns -stagger_offset `*`value`*



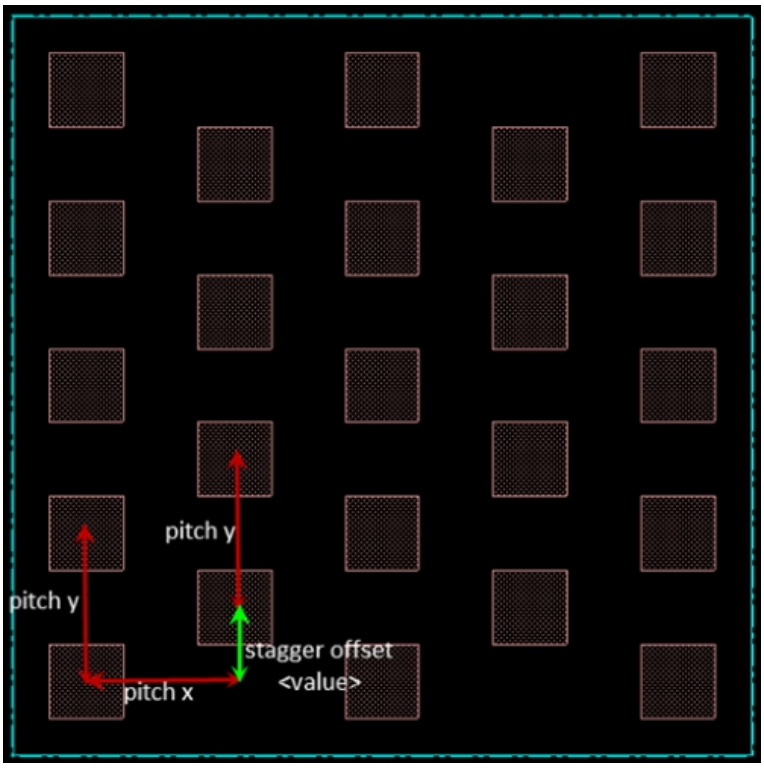
- The following example shows how `-stagger_offset` can be used to create a 5X5 array of bumps in `-stagger_type even_rows` stagger pattern:

  `create_bump -cell BUMPCELL -loc{`*`loc_x loc_y`*`} -pitch {`*`pitch_x pitch_y`*`} -pattern_array {5 5} -stagger_type even_rows -stagger_offset `*`value`*

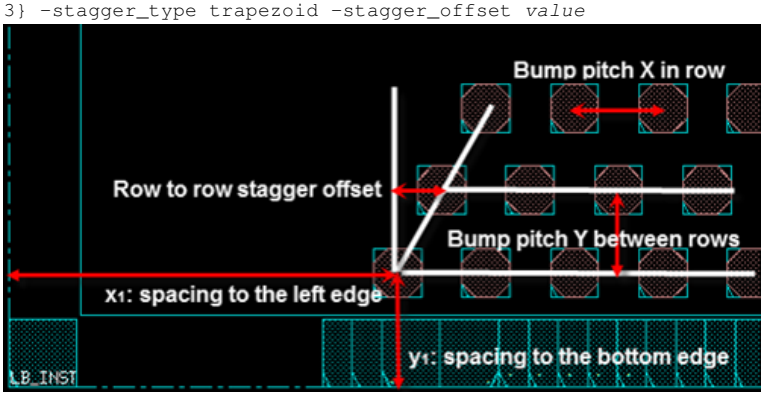


- The following example shows how `-stagger_offset` can be used to create a 5X5 array of bumps in `-stagger_type even_columns` stagger pattern:

  ```
  create_bump -cell BUMPCELL -loc{loc_x loc_y} -pitch {pitch_x pitch_y} -pattern_array {5 5} -stagger_type
  even_columns -stagger_offset value
  ```

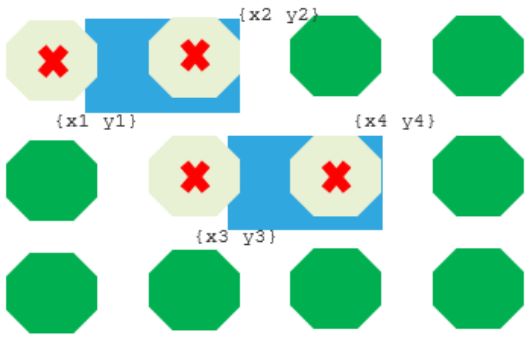


- The following example shows how `-stagger_offset` can be used with `-stagger_type trapezoid` stagger pattern to create a 3-row bump pattern on the bottom side:
  `create_bump -cell BUMPCELL -edge_spacing {left bottom right top} -pitch {pitch_x pitch_y} -pattern_side {bottom 3} -stagger_type trapezoid -stagger_offset value`



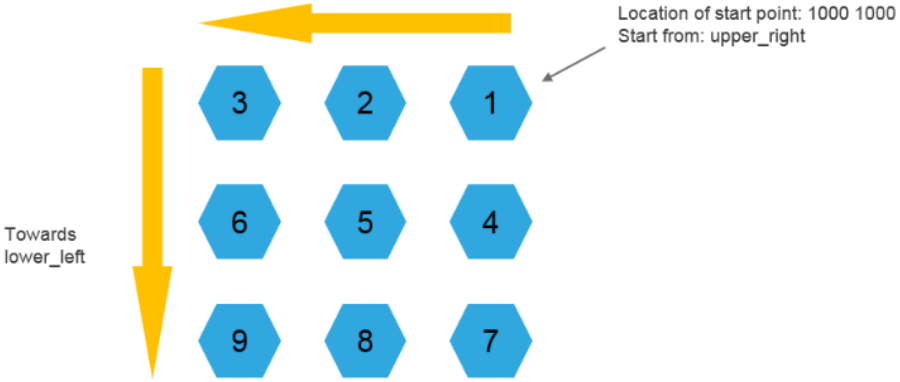
- The following command creates a 3X4 array of bumps but does not place bumps in the:
  - rectangular area with lower left corner at {x1 y1} and upper right corner at {x2 y2}
  - rectangular area with lower left corner at {x3 y3} and upper right corner at {x4 y4}

```
create_bump -cell BUMPCELL -loc {x y} -pattern_array {3 4} -exclude_bump_area {x1 y1 x2 y2 x3 y3 x4 y4}
```



- The following command creates a 3X3 array of bumps with the upper-right corner of the array starting at point (1000, 1000):

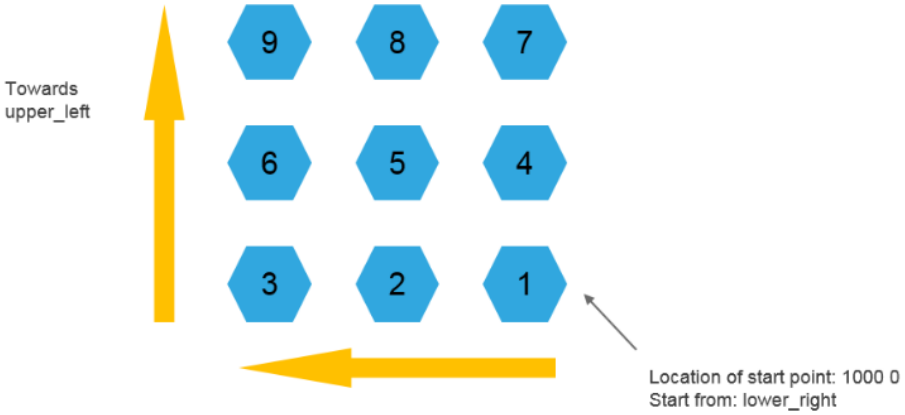
```
create_bump -pattern_array {3 3} -loc 1000 1000 -cell BUMP  -pitch 200 200 -start_from upper_right
```



The array starts from the upper right and continues towards lower left.

- The following command creates a 3X3 array of bumps with the lower-right corner of the array starting at point (1000, 0):

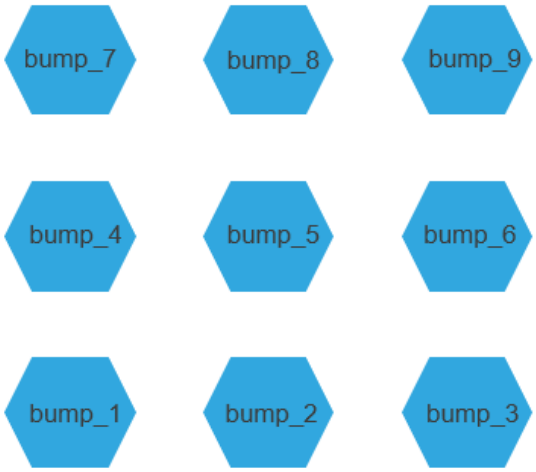
```
create_bump -pattern_array {3 3} -loc 1000 0 -cell BUMP -pitch 200 200 -start_from lower_right
```



The array starts from the lower right and continues towards upper left.

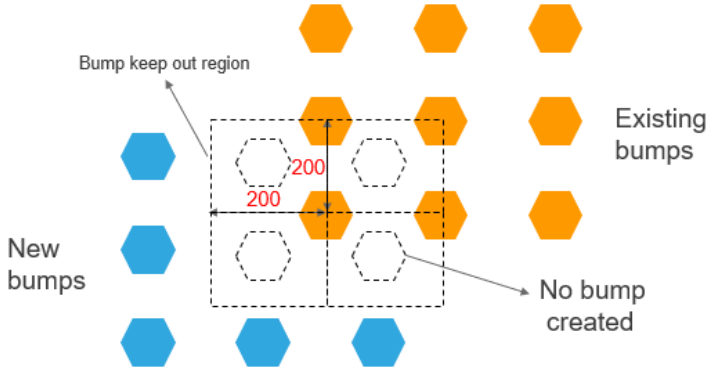
- The following command creates a 3X3 array of bumps at the specified location and returns the names of the bumps generated:

```
create_bump -pattern_array {3 3} -loc 0 1000 -cell BUMP  -pitch 200 200 -return_bumps_name
> bump_1 bump_2 bump_3 bump_4 bump_5 bump_6 bump_7 bump_8 bump_9
```



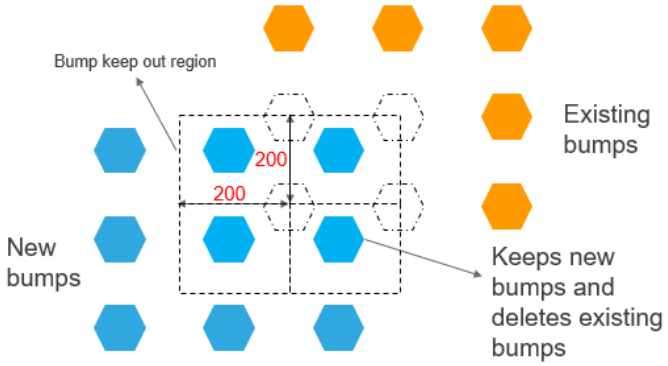
- The following command creates a 3X3 bump array and does not add new bumps in the specified keep-out region in the case of an overlap:

```
create_bump -pattern_array {3 3} -loc 200 200 -cell BUMP -pitch 200 200 \
-keep_out_region {200 200}
```



- The following command creates a 3X3 bump array and adds new bumps in the specified keep-out region in the case of an overlap:

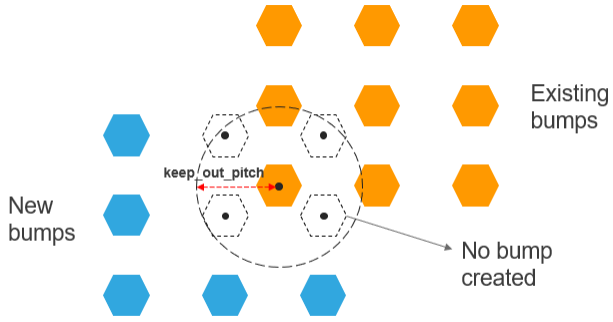
```
create_bump -pattern_array {3 3} -loc 200 200 -cell BUMP -pitch 200 200 \
-keep_out_region {200 200} -allow_overlap_control keep_new_bumps
```



- The following command creates a 5X5 bump array and allows bumps to be created outside of the die area:

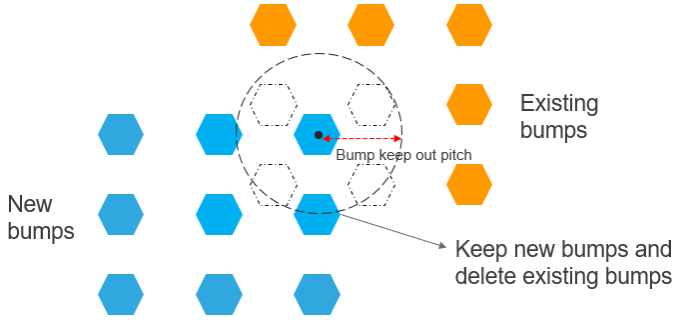
```
create_bump -cell BUMPCELL -start_from upper_right -loc 0 0 -pitch 100 100  -pattern_array {5 5} -
allow_outside_of_die
```

- The following command parses the `1.const` constraint file and creates bumps based on the specified instance pins:
  `create_bump -cell BUMPCELL -relative_type block -relative_block {`*BLOCK_LIST*`} -relative_block_constraint 1.const -relative_assignment`
- The following command creates a 3X3 bump array and does not add new bumps in the circular area defined by the specified keep-out pitch in the case of an overlap:
  `create_bump -pattern_array {3 3} -loc 200 200 -cell BUMP -pitch 200 200 -keep_out_pitch 200`



Expected bump creation

- The following command creates a 3X3 bump array and adds new bumps in the circular area defined by the specified keep-out pitch in the case of an overlap:
  ```
  create_bump -pattern_array {3 3} -loc 200 200 -cell BUMP -pitch 200 200 \
   -keep_out_pitch 200 -allow_overlap_control keep_new_bumps
  ```



Expected bump creation

createSignalPin

```
createSignalPin
[-help]
[-ignore_floating_pins]
{-inst inst_name_list | -pins pin_name_list}
```

Promotes signal pins in the IO pad/block to the top-level design as a physical pin for specified instances or pins. The instance's cell type should be either CLASS PAD AREAIO or CLASS BLOCK. The pins to be promoted should have geometry on the top layer. You can choose to ignore floating pins.

Parameters

`-help`	Prints a brief description that includes type and default information for each `createSignalPin` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man createSignalPin`
`-ignore_floating_pins`	Ignores the floating pins. If this parameter is not specified when promoting pins to the top level, the tool converts the floating pins in the instance to pgTerms because these pins are not logically connected to any terminal on the top level.
`-inst` *`inst_name_list`*	Specifies the names of instances for which pins need to be created. **Note**: This option cannot be used with `-pins`.
`-pins` *`pin_name_list`*	Lists specific pins that are to be promoted to the top level. The specified pins should be hierarchical. **Note**: This option cannot be used with `-inst`.

Examples

- The instance `lna_inst` has a signal pin called `data1_i`. The pin `data1_i` has a port geometry shape on the top layer. The lef for the `lna` cell is as follows:

```
MACRO lna

CLASS BLOCK ;

……

  PIN data1_i

    DIRECTION INPUT ;

    USE SIGNAL ;

    PORT

        CLASS BUMP ;

        LAYER METAL8 ;

        RECT   10.00 10.00   20.00 100.00 ;

    END

  END data1_i

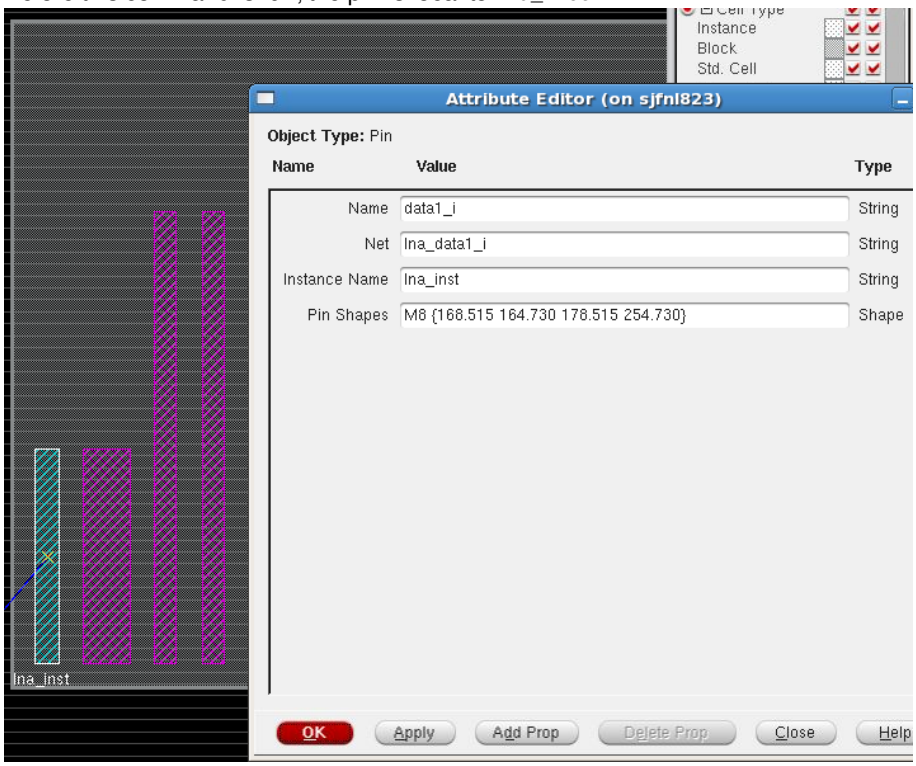
….

END lna
```

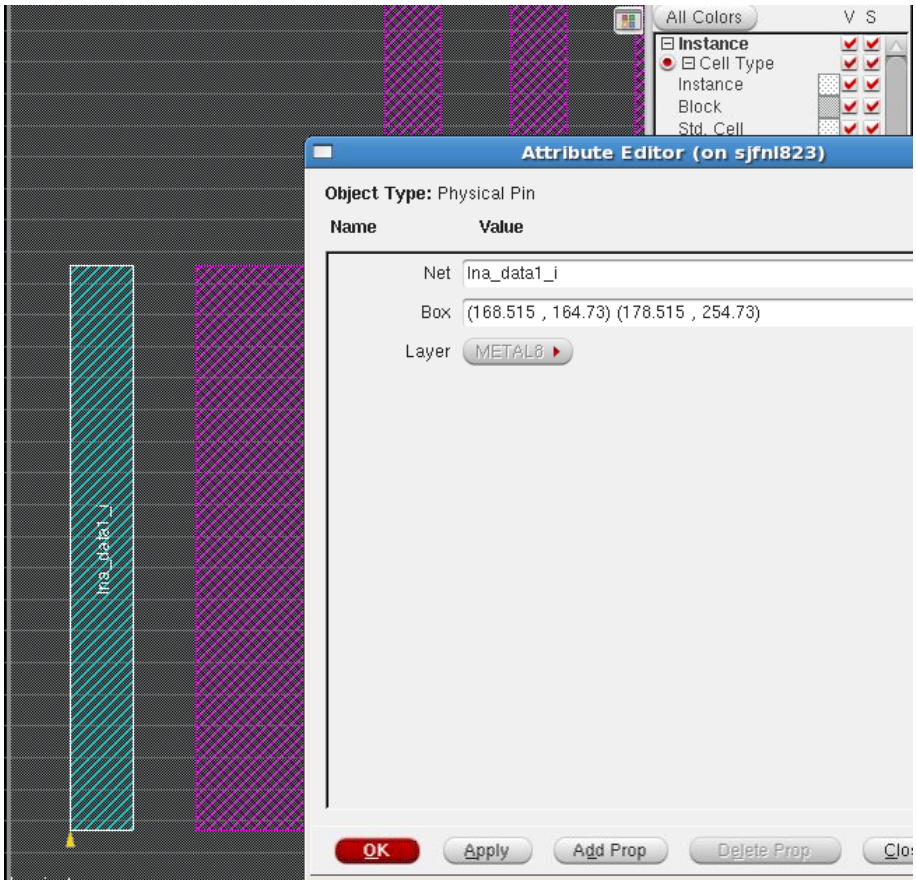
The following command creates a signal pin for the instance `lna_inst`:

```
createSignalPin -inst lna_inst
```

- Before this command is run, the pin is local to `lna_inst`:



- After the command is run, the pin is promoted:



- The following command promotes the specified pins to the top level:

```
createSignalPin -pins {lna_inst/data1_i lna_inst/data2_i phy/QS_PADP}
```

deleteAIoFiller

```
deleteAIoFiller
[-help]
-cell fillerCellName
[-prefix prefix]
-aioRowCluster aioRowClusterName | -allAIORowCluster
[-inst fillerInstanceName]
```

Deletes area I/O filler cell instances. Use this command after using the `addAIoFiller` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `deleteAIoFiller` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man deleteAIoFiller`
`-aioRowCluster` *`aioRowClusterName`*	Specifies the area I/O row cluster name where all area I/O filler cells will be deleted. **Note:** This parameter overrides `-allAIORowCluster`, i.e If you specify both, `-aioRowCluster` *`aioRowClusterName`* and `-allAIORowCluster` parameters, then only `-aioRowCluster` *`aioRowClusterName`* is valid.
`-allAIORowCluster`	Deletes all area I/O filler cells from all area I/O row clusters.
`-cell` *`fillerCellName`*	Specifies the name of the area I/O filler cell to delete.
`-inst` *`fillerInstanceName`*	Specifies the name of the area I/O filler instance name to delete.
`-prefix` *`prefix`*	Specifies the prefix name of the area I/O filler cell instance to be removed.

Example

- The following command deletes a filler cell from all area I/O row clusters:
  ```
  deleteAIoFiller -cell AO_123 -allAIORowCluster
  ```

Related Information

- `addAIoFiller`

deleteBumpConnectTargetConstraint

```
deleteBumpConnectTargetConstraint
[-help]
{-bump list_of_bumps | -selected | -all }
[-instName instance_name [-pinName pin_name [-portNum value]]]
```

Deletes existing properties on specified, selected, or all bumps. If a bump has multiple values for the property, use `-instName`, `-pinName` and `-portNum` to filter out the matched property value for deletion. If only `-instName` is specified, then all property values for the pad are deleted. If only `-instName` and `-pinName` are specified, then all property values for the pin are deleted. If the specified property value cannot be found for a bump, the tool prints an error message for the bump only and continues to process other bumps.

Parameters

`-help`	Prints a brief description that includes type and default information for each `deleteBumpConnectTargetConstraint` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man deleteBumpConnectTargetConstraint`
`-bump list_of_bumps | -selected | -all`	
	Deletes bump connect target constraint on specified, selected, or all bumps. The `-bump` option can accept wild cards and `-selected` can have multiple bumps selected.
`-instName instance_name`	Deletes the bump connect target constraint related to the specified instance.
`-pinName pin_name`	Deletes the bump connect target constraint related to the specified pin. **Note:** This option can be used only if you specify `-instName`.
`-portNum value`	Deletes the bump connect target constraint related to the specified port number. **Note:** This option can be used only if you specify `-instName` and `-pinName`.

Examples

- The following command removes `bump_connect_target` property on `Bump_1` which pairs with `VDD` PIN of instance `IOPADS_INST/esd`.

  ```
  deleteBumpConnectTargetConstraint -bump Bump_1 -instName IOPADS_INST/esd -pinName VDD
  ```

- The following command removes all `bump_connect_target` properties on `Bump_1`.

  ```
  deleteBumpConnectTargetConstraint -bump Bump_1
  ```

Related Information

deleteBumps

```
deleteBumps
[-help]
[-all]
[-bumps bump+]
[-floating]
[-overlap_areaio]
[-overlap_blockages]
[-overlap_keepout bumpCellName]
[-overlap_macro]
[-selected]
```

```
Removes bumps from the design. Use this command anytime after creating a bump.
```

Deletion of assigned bumps is also supported. If any of the bumps being deleted is assigned, `deleteBumps` displays a WARNING message and deletes all specified non-routed bumps, assigned as well as unassigned.

If you click *Undo* after running `deleteBumps`, the changes made by `deleteBumps` are cancelled out and the following bump properties are recovered:

- Name
- Location
- Port number properties
- Fixed status
- Placement status

On clicking *Redo*, the bump floorplan will revert to the status before undo.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `deleteBumps` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man deleteBumps`
`-all`	Deletes all bumps.
`-bumps bump+`	Specifies the names of the bumps to be deleted. You can use wildcards in the bump name list.
`-floating`	Deletes bumps which are not assigned to any nets.
`-overlap_areaio`	Deletes bumps that overlap with the area I/O cells. You must first select the area I/O cells in the design display area, then use this command to delete the bumps.
`-overlap_blockages`	Deletes all bumps that overlap routing blockages on the same layer. For example, if a bump on layer M7 overlaps a routing blockage on layer M7, the bump is deleted when you use this parameter.
`-overlap_keepout`	Deletes specified bumps that overlap the bump keep out zone.
`-overlap_macro`	Deletes all bumps that overlap the selected macros. You must first select the macros in the design display area, then use this command to delete the bumps.
`-selected`	Deletes selected bumps. You must first select the bumps in the design display area, then use this command to delete the bumps.

Example

- The following command deletes all non-routed bumps, assigned as well as unassigned, in the current design:
  ```
  deleteBumps -all
  ```
- The following command deletes all selected bumps, whether assigned or unassigned:
  ```
  deleteBumps -selected
  ```

deselect_bump

```
deselect_bump
[-help]
[-alternate {row column}]
[-area {{x1 y1 x2 y2} ...}]
[-assigned]
[-bump_cell {cell_list}]
[-bumps {bump_list}]
[-floating]
[-max_distance_to_side distance]
[-nets {net_list}]
[-side {top bottom left right}]
[-start_lower_left]
[-type {signal power ground}]
```

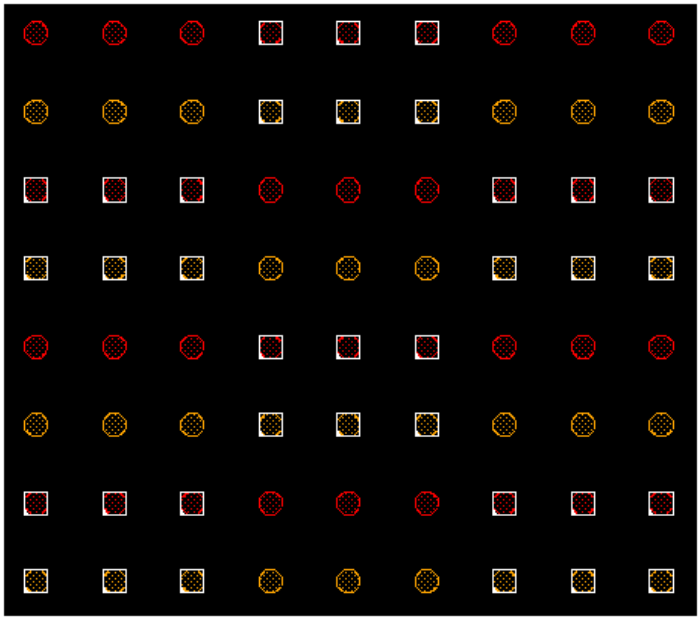
Enables you to deselect bumps in different ways. For example, you can deselect bumps by type or by net. By default, deselects all bumps in the design.

Parameters

`-help`	Prints a brief description that includes type and default information for each `deselect_bump` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man deselect_bump`
`-alternate {row column}`	Specifies the alternate bump pattern. You have to select an area to be alternate-deselected before using this option.
`-area {{x1 y1 x2 y2} ...}`	Specifies one or more areas from which bumps are to be deselected.
`-assigned`	Deselects only the bumps that are assigned.
`-bump_cell {cell_list}`	
	Specifies names of bump cells and the bumps with these bump cells are deselected. You can use wildcards in the bump cell list.
`-bumps {bump_list}`	Specifies names of the bumps to be deselected. You can use wildcards in the bump list.
`-floating`	Deselects only unassigned or floating bumps.
`-max_distance_to_side distance`	
	Specifies the maximum distance away from the side in microns. When specified, only the bumps with geometries completely in that region are deselected. By default, half the width/height of the die is used as the maximum distance to each side. For `distance`, minimum value is `0` and maximum is `1e+20`.
`-nets {net_list}`	Specifies names of nets and the related bumps are deselected. You can use wildcards in the net list.
`-side {top bottom left right}`	
	Specifies the side relative to which bumps are deselected.
`-start_lower_left`	
	Specifies the start point of alternate deselection. If it is not specified, the lower-left point is considered the start point of alternate selection. **Note**: This parameter can be used only with `-alternate`.
`-type {signal power ground}`	
	Specifies the type of bumps to be deselected.

Examples

- The following command deselects all bumps in the design:
  ```
  deselect_bump
  ```
- The following command deselects the bottom edge of bump geometry no more than 500 microns away from the top side:
  ```
  deselect_bump -side top -max_distance_to_side  500
  ```
- After selecting all the bumps in a design or in a specific area, use the following command to alternately deselect a `2x3` bump pattern:
  ```
  deselect_bump -alternate {2 3}
  ```
  The resulting deselection pattern is shown below. Note that as `-start_lower_left` is not specified, the bumps in the the lower-left corner are not deselected (that is, they are alternate selected).



Related Information

- `select_bump`

edit_bump_name

```
edit_bump_name
[-help]
-from current_pattern
[-selected]
-to new_pattern
```

Modifies the names of selected or specified bumps according to the specified pattern.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `edit_bump_name` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man edit_bump_name`
`-from` *current_pattern*	
	Specifies the name of a single bump or a pattern for the names of the bumps to be edited. The pattern is a regular expression, such as `{Bump_\d+}` or `{Bump_(\d)(\w+)}`, which can be referred in TCL. When specifying a pattern, the opening and closing braces are required.
`-selected`	Modifies the names of selected bumps.
`-to` *new_pattern*	
	Specifies the new name or name format for target bumps. When specifying a name format, the opening and closing braces are required.

Examples

- The following command modifies the names of all bumps that have the pattern `Bump_\d+`, such as `Bump_1` and `Bump_12`, to bumps with pattern `signal_\d+`, such as `signal_1` and `signal_12`:
  ```
  edit_bump_name -from {Bump_} -to {signal_}
  ```
- The following command modifies the name of the `Bump_1_1_1` bump to `signal_bump`:
  ```
  edit_bump_name -from {Bump_1_1_1} -to {signal_bump}
  ```
- The following command modifies the names of all bumps that have the pattern `Bump_(\d)_(\d)_(\d)` to bumps named `1_1_1_signal`, `1_1_2_signal`, and so on:
  ```
  edit_bump_name -from {Bump_(\d)_(\d)_(\d)} -to {\1_\2_\3_signal}
  ```

Related Information

editBumpConnectTargetConstraint

```
editBumpConnectTargetConstraint
[-help]
{-bump list_of_bumps | -selected }
{-instName instance_name
  {[-toInstName instance_name]
   [-pinName pin_name {[-toPinName pin_name]
   [{-portNum value -toPortNum value}]}]}}
```

Modifies the property values on bumps. You can change the instance name, pin name, and port name on specified or selected bumps.

Parameters

`-help`	Prints a brief description that includes type and default information for each `editBumpConnectTargetConstraint` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man editBumpConnectTargetConstraint`
`-bump list_of_bumps | -selected`	Edits the bump connect target constraint on specified or selected bumps. The `-bump` option accepts wild cards and `-selected` can have multiple bumps selected.
`-instName instance_name`	Specifies the name of the instance for which you want to change the bump connect target constraint.
`-pinName pin_name`	Specifies the name of the pin for which you want to change the bump connect target constraint.
`-portNum value`	Specifies the port number for which want to change the bump connect target constraint.
`-toInstName instance_name`	Specifies the instance name to change to in the bump connect target constraint.
`-toPinName pin_name`	Specifies the pin name to change to in the bump connect target constraint.
`-toPortNum value`	Specifies the port number to change to in bump connect target constraint.

Example

- The following command modifies `bump_connect_target` property on `Bump_1` to change pairing between `Bump_1` and instance `IOPADS_INST/esd` from `PORT1` to `PORT2`. `PORT1` and `PORT2` are under `VDD` PIN of instance `IOPADS_INST/esd`.

  ```
  editBumpConnectTargetConstraint -bump Bump_1 -instName IOPADS_INST/esd -pinName VDD -portNum 1 -toPortNum 2
  ```

fcroute

```
fcroute
[-help]
-type {power | signal}
[-area {x1 y1 x2 y2}]
[-connectInsideArea]
[-connectTsvToBump] | [-connectTsvToPad] | [-connectTsvToRingStripe]
[-constraintFile filename]
[-deleteExistingRoutes]
[-designStyle {aio | pio}]
[-doubleBendRoute]
[-eco | -incremental]
[-extraConfig fileName]
[-globalOnly]
[-jogControl {preferWithChanges | preferSameLayer | preferDifferentLayer}]
[-keepDRC]
[-layerChangeBotLayer layerName]
[-layerChangeTopLayer layerName]
[-minEscapeDistance unit]
[-msgRate int]
[-nets {net_name_list | <filename | ~<filename} | -selected_bump]
[-overflowMap]
[-route_pg_style {none finger mesh}]
[-routeWidth real]
[-spreadWiresFactor value]
[-straightConnections [[straightWithDrcClean] [straightWithChanges]]
[-subclass subclass_string]
[-verbose]
```

Specifies that power routing and signal routing recognize the bumps specified in a flip chip design.

- The command supports all the `LEF 5.7` syntax to determine which power/ground pin shape on the I/O driver cell must be connected to a bump. For more information, see the "Performing Area I/O Placement" section in the Data Preparation chapter of the *Innovus User Guide*.
- The command supports mixed mode designs in the area I/O (AIO) and peripheral I/O (PIO) mode.
- The command, by default, reads the FE database to get all information. The default value of the variable, `set rda_global` (`srouteUseFEDB`) must be set to `1`. For the command to read information from the LEF file, the `set rda_global` (`srouteUseFEDB`) variable must be set to `0`.

Use this command after importing the design.

You can perform signal routing (`-type signal`) using the AIO or PIO routing styles. Each routing style supports a specific set of `fcroute` command parameters. The following table lists the routing style support for each parameter.

Note: The following table might not be readable when viewed with the Unix `man` command. Check the `fcroute` command description in the *Innovus Text Command Reference* to view the table.

fcroute Parameters	**-designStyle**	
	aio	**pio**
`-area {x1 y1 x2 y2}`	X	X1
`-connectInsideArea`	X	
`-connectTsvToBump`	X	

`-connectTsvToPad`	X	
`-connectTsvToRingStripe`	NA	NA
`-constraintFile filename`	X	X
`-deleteExistingRoutes`	X	X
`-doubleBendRoute`	X	X
`-eco`	X	X
`-extraConfig` *fileName*	X	X
`-globalOnly`		X
`-incremental`		X
`-jogControl {preferWithChanges | preferSameLayer | preferDifferentLayer}`	X	
`-keepDRC`	X	X
`-layerChangeBotLayer` *layerName*	X	X
`-layerChangeTopLayer` *layerName*	X	X
`-minEscapeDistance` *unit*	X	X
`-msgRate` *int*	X	X
`-nets {`*net_name_list* `| <filename | ~<filename}`	X	X
`-overflowMap`		X
`-routeWidth` *real*	X	X
`-selected_bump`	X	X
`-spreadWiresFactor` *value*	X	X
`-straightConnections [straightWithDrcClean] [straightWithChanges]`	NA	NA
`-type {power | signal}`	NA	NA
`-verbose`	X	X

X[1]	When run incrementally, the `fcroute` PIO mode partially supports area-based routing in the specified coordinates (`fcroute -area {`*x1 y1 x2 y2*`} -incremental`) for the area in which the net is routed.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `fcroute` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man fcroute`

`-area {x1 y1 x2 y2}`	Specifies the coordinates for area I/O routing. You must enclose the x and y coordinates in curly braces and separate them with a space. **Notes**: • A warning message is issued if you specify area constraints in the flip chip route PIO mode. (`fcroute -designStyle pio`) • If `-route_pg_style` is specified as `finger`, the PG finger is routed in the area specified with `-area`. If `-route_pg_style` is not specified or specified as `none`, area I/O routing is done within the coordinates specified with `-area`.
`-connectInsideArea`	Specifies that connections from all sources within the specified area can connect only to targets that are also inside that area. **Note:** This parameter is only available if you also specify the `-area` parameter. *Default:* If you do not specify this option the software makes connections from all sources within the specified area to targets both inside and outside the specified area.
`-connectTsvToBump`	Connects TSVs to signal bumps. Use the `-connectTsvToBump` parameter with `-type signal`. This parameter cannot be used along with -connectTsvToPad and `-connectTsvToRingStripe`, which provide other routing options. **Note**: Different layers have different types of bumps. It is recommended that you route the bump on the back side and front side separately using the `srouteExcludeBumpType` statement in the extra configuration file.
`-connectTsvToPad`	Connects TSVs to IO pads. Use the `-connectTsvToPad` parameter with `-type signal`.
`-connectTsvToRingStripe`	Connects TSV with power net to the power mesh. Use the `-connectTsvToRingStripe` parameter with `-type power`. For more information, see the "*TSV/Bump/Back Side Metal Modeling in Innovus*" section in the Design Methodology for 3D IC with Through Silicon Via chapter of the *Innovus User Guide*.
`-constraintFile filename`	
	Specifies the file that contains constraints for flip chip routing. For more information, see "Useful Constraints for Flip Chip Routing" in the Flip Chip Methodologies chapter of the *Innovus User Guide.*
`-deleteExistingRoutes`	
	Specifies that the software remove existing connections when you use the `fcroute` command multiple times. *Default:* The software maintains existing connections each time you issue the `fcroute` command. **Note:** If you specify the `-area` parameter, existing routes are always preserved, even if you also specify the `-deleteExistingRoutes` parameter.
`-designStyle {aio | pio}`	
	Selects between area I/O and peripheral I/O routing styles. The area I/O (`aio`) mode supports area-based routing (`fcroute -area`). However, the peripheral I/O (`pio`) mode partially supports area-based routing only if you set the `-incremental` parameter. You can run fcroute in the PIO/AIO mode when pre-routes are already in the design, without deleting or re-routing the pre-routes. By default, this feature is true for `fcroute -type signal -designStyle aio`. For the `pio` mode, you should add the `-incremental` parameter to enable this feature. *Default*: `pio`

`-doubleBendRoute`	Allows double-bend routing on segments between a bump pin and a pad pin.  **Note:** Segments that connect directly to a bump pin or pad pin are always routed at 90 degrees. *Default*: Off
`-eco`	Enables ECO mode flip chip routing. When you specify this parameter, `fcroute` automatically performs typical ECO routing steps, such as deleting existing routing results or re-routing affected nets, whenever there is an ECO change. For more information, see the ECO Routing section in the "Flip Chip Methodologies" chapter of the *Innovus User Guide*. **Note:** The `-eco` parameter cannot be used along with `-incremental`.
`-extraConfig` *filename*	Specifies the name of an extra configuration file. This file contains additional fcroute commands that provide more control over the routes to bumps. For example, `fcroute -type signal -designStyle PIO -extraConfig mixmode.config` For more information, see "Useful Extra Configurations for Flip Chip Routing" in the Flip Chip Methodologies chapter of the *Innovus User Guide.*
`-incremental`	Runs the PIO mode incrementally when pre-routes are already in the design, without deleting or re-routing the pre-routes. **Note:** The `-incremental` parameter cannot be used along with `-eco`.
`-globalOnly`	Executes the global router to provide you with the routability statistics. When this option is specified, `fcroute` displays how the global router distributes routing resources and finishes routing with a minimum routing width. This is helpful for optimizing mode.
`-jogControl {preferWithChanges | preferSameLayer | preferDifferentLayer}`	
	Specifies that jogs are allowed during routing to avoid DRC violations. You must specify either the `-jogControl` parameter or the `-straightConnections` parameter. If you specify the `-jogControl` parameter, you can also specify one of the following options: • `preferWithChanges`: Specify this option if you prefer the software to make straight connections between targets, and to change layers instead of jog to avoid DRC violations. If you do not specify this option, the route uses both layer changes and jogging to avoid DRC violations. • `preferSameLayer`: If the route must jog to avoid a DRC violation, the jog occurs on the same layer whenever possible. This can result in routing in the non-preferred direction. • `preferDifferentLayer`: If the route must jog to avoid a DRC violation, the jog occurs on the layer that is in the preferred routing direction whenever possible.

`-keepDRC`	If specified, the command `clearDrc` will not run implicitly when executing the `fcroute` command, hence retaining the DRC violations. Otherwise, the command `clearDrc` runs implicitly when executing the `fcroute` command by default, purging all the violation markers.
`-layerChangeBotLayer` *layerName*	

	Specifies the bottom-most metal layer number / `LEF` layer names that the software can use when routing bumps.
	Default: If you do not specify this parameter, all layers are used.
	For example, you can specify the metal layer numbers, `8` and `2`, as follows:
	`fcroute -type power -routeWidth 4.0 -layerChangeTopLayer 8 -layerChangeBotLayer 2`
	You can also specify the `LEF` layer names, `METAL7` and `METAL1`, as follows:
	`fcroute -type power -routeWidth 4.0 -layerChangeTopLayer METAL7 -layerChangeBotLayer METAL1`

`-layerChangeTopLayer` *layerName*	
	Specifies the top-most metal layer number / `LEF` layer names that the software can use when routing bumps. *Default:* If you do not specify this parameter, all layers are used.
`-msgRate` *int*	Specifies the interval at which progress messages are generated. If you specify `1`, the software generates every progress message; if you specify `2`, the software generates every other progress message, and so on. *Default:* `0`
`-minEscapeDistance` *value*	
	Specifies the minimum distance from the edge of the pin to the edge of the wire segment.
`-nets {`*net_name_list* `| <filename | ~<filename}`	
	Specifies the nets to be connected or excluded from connection. *Default:* If you do not specify the `-nets` parameter, the software connects all power and ground nets in the design. Use one of the following options: • *net_name_list*: Specifies names of the nets to be connected. To specify more than one net, enclose the net names in braces and separate the names with a space. **Note:** As the `-nets` option accepts a maximum of 4096 string characters directly, use the *net_name_list* option if the number of nets to be connected is not very high. If a large number of nets need to be connected, use the `<filename` option or `~<filename` option with `-nets`. • `<filename`: Specifies the name of a text file containing the list of nets to be connected. Use this option if the number of nets to be connected is high. In the text file, separate net names with commas or the newline, space, or tab character. Wildcards can be used when specifying net names in the text file. • `~<filename`: Excludes the nets in the specified text file during flip chip routing. Use this option if the number of nets to be excluded is much lower than the number of nets to be connected. Wildcards can be used when specifying net names in the text file.

`-overflowMap`	Displays the thermal map using the width and spacing parameters specified in the extra configuration file. To display the thermal map in the floorplan view in the GUI, select *All Colors* which opens the Color Preferences form, then select *GCell Overflow*. **Note:** The routing congestion can also be displayed using the `setLayerPreference` command. (`setLayerPreference gcellOvflow -isVisible 1`) `-route_pg_style {none finger mesh}`	
	Specifies the routing pattern for flip chip route power routing: • `none`: For normal PG routing • `finger`: For PG finger routing style, in which you need to specify the routing direction. This option must be used with `fcroute -area` option. PG finger routing improves usability and provides better IR drop by lowering rail resistance. • `mesh`: For mesh-style PG routing on the redistribution layer (RDL). This option is used to increase PG density. If you specify PG mesh routing, you must specify the main width of the PG mesh by using the `setFlipChipMode -pg_mesh_main_width` parameter. *Default:* `none`
`-routeWidth` *real*	Connects wires to bumps using the specified width only, regardless of the size of the bump or the source to which the bump connects. *Default:* When using the PIO routing style, FCroute determines the width of the route as the bump width or I/O cell pin width that is connected to the bump, whichever is smaller. When using the AIO routing style, FCroute does not restrict the size of the RDL route to the width of the I/O cell pin and can route a wire that is larger in width than the specified I/O cell pin width. To override the above default setting for AIO routing style, you can use the `srouteUseSpecifiedWidthForTopLayer TRUE` and `srouteRouteWidthForLowerLayer` *db_unit* variables in the extra configuration file. This forces `fcroute` to use user-defined width for the top layer connecting to the bump and the lower layer. **Note:** `The fcroute` command considers the route width value from the constraint file if it is higher than `fcroute -routeWidth`, to enable splitting of wires.
`-selected_bump`	Routes the selected bumps. The selected bumps can be either power bumps or signal bumps.

`-spreadWiresFactor` *`value`*	Specifies automatic spreading of wires during bump routing in order to prevent any SI violations. The *`value`* is applied as a multiple of the minimum spacing that is required.
`-straightConnections [straightWithDRCClean] [straightWithChanges]`	
	Specifies that only straight connections are made between targets and that jogs are not allowed during routing. This option is available only with `fcroute -type power`. You must specify either the `-straightConnections` parameter or the `-jogControl` parameter. If you specify the `-straightConnections` parameter, you can also specify one or both of the following options: • `straightWithDRCClean`: Leaves a route open if a straight connection cannot reach a target without causing a DRC violation. If you do not specify this option, the software makes a straight connection to a target, even if the route creates a DRC violations. • `straightWithChanges`: Permits the route to change to another layer to avoid DRC violations. If you do not specify this option, the software makes only straight connections on the same layer.
`-subclass` *`subclass_string`*	
	Assigns specified string as a subclass name to the wires and vias created.
`-type {power | signal}`	Specifies whether power or signal bumps are to be routed. **Note:** For `-type power`: • If `-route_pg_style` is specified as `finger`, the power bumps are routed in the finger routing style. • If `-route_pg_style` is not specified or specified as `none`, the power bumps are routed in normal PG routing style.
`-verbose`	Specifies that each progress message appears in the log file and the console.

Example

- The following set of commands can be used to route RDL finger in the South direction:

```
setFlipChipMode -route_pg_style finger
setFlipChipMode -finger_direction S
setFlipChipMode -finger_max_width 13
setFlipChipMode -finger_min_width 10
setFlipChipMode -finger_target_mesh_layer_range M4:M6
fcroute -type power -area {0 0 1446 1405}
```

  The RDL finger routing result:

findPinPortNumber

```
findPinPortNumber
[-help]
[-area x1 y1 x2 y2 ]
[-bumps bump_list]
[-geometry_height {min [max]}]
[-geometry_width {min [max]}]
[-layer string]
[-selected]
[-cellName cell_name | -instName instance_name ]
{-pinName pin_name | -netName  net_name }
```

Determines suitable ports available for a bump. The command has the following functions:

- Check if the IO pad has a standard LEF definition.
- Suggest suitable ports for flip chip routing on the specified instance based on the pin name or nets in a specified area.
- Filter ports by layer, geometry size, and area. Only the ports that match the specified filter rules are returned by `findPinPortNumber`.
- Consider routing between bumps and ports to return the combinations of `{bump:inst:pin:port}` if the bumps for which ports are to be found are specified.

`findPinPortNumber` returns a port number string list. You can use `set result [findPinPortNumber]` or `catch {findPinPortNumber} result` to get the result.

The following commands provide additional support for the port numbering feature. Use these commands to add, edit, and delete bump properties easily:

- `addBumpConnectTargetConstraint`
- `deleteBumpConnectTargetConstraint`
- `editBumpConnectTargetConstraint`

Parameters

`-help`	Prints a brief description that includes type and default information for each `findPinPortNumber` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man findPinPortNumber`
`-area` *`x1 y1 x2 y2`*	Specifies the area in which the command will be used. `findPInPortNumber` returns port numbers overlapping with the specified area.
`-bumps` *`bump_list`*	Finds suitable ports for the specified bumps based on the smallest distance. This option supports only 1:1 pairing between ports and bumps. Therefore, if the number of ports is different from the number of bumps, pairing is based on the smaller number. `findPinPortNumber` allows empty bumps or bumps assigned to the same net as the pin. If the assigned net is different from the net with which the pin is connected, `findPinPortNumber` issues an error message and quits.
`-cellName` *`cell_name`*	Finds the pin port number of the instance of the specified cell. Wild cards are supported in *`cell_name`*.
`-geometry_height {`*`min`* `[`*`max`*`]}`	
	Specifies the minimum and maximum values for the height of the target port's geometry. If you specify only one value, the height is taken as equal to the specified value. Only ports that match the specified height criterion are returned by `findPinPortNumber`.
`-geometry_width {`*`min`* `[`*`max`*`]}`	
	Specifies the minimum and maximum values of the width of the target port's geometry. If you specify only one value, the width is taken as equal to the specified value. Only ports that match the specified width criterion are returned by `findPinPortNumber`.
`-instName` *`instance_name`*	Finds pin port number of the specified instance. Wild cards are supported in *`instance_name`*.
`-layer` *`string`*	Filters target ports by layer. If you specify this parameter, only ports on the specified layer are returned. You can specify either layer name or layer ID, such as `M8`.
`-pinName` *`pin_name`* `|` `-netName` *`net_name`*	
	Finds the port number on the specified pin or on the pin connected to the specified net.

`-selected`	Finds suitable ports for the selected instance and bumps:
	• If only bumps are selected, `findPinPortNumber` first finds the ports satisfying the specified filtering rules and then considers the routing between these ports and the selected bumps.
	• If only IO instances are selected:
	  ◦ If only one IO instance is selected, `findPinPortNumber` finds the ports satisfying the specified filtering rules.
	  ◦ If more than one IO instance is selected, `findPinPortNumber` issues an error message stating that only a single IO instance is supported for this option and then quit.
	• If both IO instances and bumps are selected:
	  ◦ If only one IO instance is selected, `findPinPortNumber` first finds the ports satisfying the specified filtering rules and then considers the routing between these ports and the selected bumps.
	  ◦ If more than one IO instance is selected, `findPinPortNumber` issues an error message stating that only a single IO instance is supported for this option and then quit.

Example

- The following command suggests port numbers on instances named `IOPADS_INST/ esd*` for the pins connected to net `VDD`.

  ```
  findPinPortNumber -instName IOPADS_INST/esd* -netName VDD
  ```

  The tool returns a list of suitable port numbers as follows:

  ```
  IOPADS_INST/esd:VDD:1 IOPADS_INST/esd1:VDD:1
  ```

- The diagram below depicts an IO instance `padring/inst1` with three ports for `PIN PADVDDE` on the same layer and with the same size. The bumps `Bump_1`, `Bump_2`, `Bump_3`, and `Bump_4` are empty.

  - The following command finds ports of the pin `PADVDDE` on the instance `padring/inst1` that meet the specified area constraint:

    ```
    findPinPortNumber -instName padring/inst1 -pinName PADVDDE -area "50 100 300 250"
    ```

    For the instance depicted in the diagram above, the command returns `{padring/inst1:PADVDDE:1}`.

  - The following command finds ports of the pin `PADVDDE` on the instance `padring/inst1` that meet the specified area constraint:

    ```
    findPinPortNumber -instName padring/inst1 -pinName PADVDDE -area “550 120 650 350”
    ```

    For the instance depicted, the command returns `{padring/inst1:PADVDDE:2 padring/inst1:PADVDDE:3}`. Both `port2` and `port3` are returned as they overlap with the specified area constraint.

  - The following command finds suitable ports of the pin `PADVDDE` on the instance `padring/inst1` for the specified bump:

    ```
    findPinPortNumber -instName padring/inst1 -pinName PADVDDE -bumps Bump_2
    ```

    For the instance depicted, the command returns `{Bump_2:padring/inst1:PADVDDE:2}`.

  - The following command finds suitable ports of the pin PADVDDE on the instance padring/inst1 for the specified bumps:

    ```
    findPinPortNumber -instName padring/inst1 -pinName PADVDDE -bumps {Bump_1 Bump_2 Bump_3 Bump_4}
    ```

    For the instance depicted, the command returns `{Bump_1:padring/inst1:PADVDDE:1 Bump_2:padring/inst1:PADVDDE:2 Bump_3:padring/inst1:PADVDDE:3}`.

fixBondPad

```
fixBondPad
[-help]
{{-ioInstName InstName [-pinName pinName]}
 | -selected}
```

Assigns a fixed status to a specified bond pad. This restricts other bond pad commands from modifying the bond pad.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `fixBondPad` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man fixBondPad`
`-ioInstName` *instName*	Specifies the name of the I/O instance whose bond pad will be assigned as fixed.
`-pinName` *pinName*	Specifies the name of the pin inside the instance.
`-selected`	Assigns a fixed status to a selected bond pad. You must first select the bond pad in the design display area, then use this parameter to assign the fixed status.

Example

- The following command assigns a fixed status to the bond pad in I/O instance `pad_addr[30]`:
  ```
  fixBondPad -ioInstName {pad_addr[30]}
  ```

Related Information

- checkBondPadSpacing
- getBondPad
- placeBondPad

- unfixBondPad

get_physical_info

```
get_physical_info
[-help]
{-object string | -selected }
[-highlight]
[-shapes {RING STRIPE FOLLOWPIN IOWIRE COREWIRE BLOCKWIRE PADRING BLOCKRING FILLWIRE FILLWIREOPC DRCFILL None}]
[-subclass {subclass_name_list}]
[-type {connection | routing_path}]
```

Gets the physical connection or routing path between IO pads and bumps. For example, you can select a bump or specify bump name to get information about connected IO pad. Alternatively, you can select or specify an IO pad and get information about connected bumps. You can specify IO pads by pad name, instance:pin combination, or instance:pin:port combination.

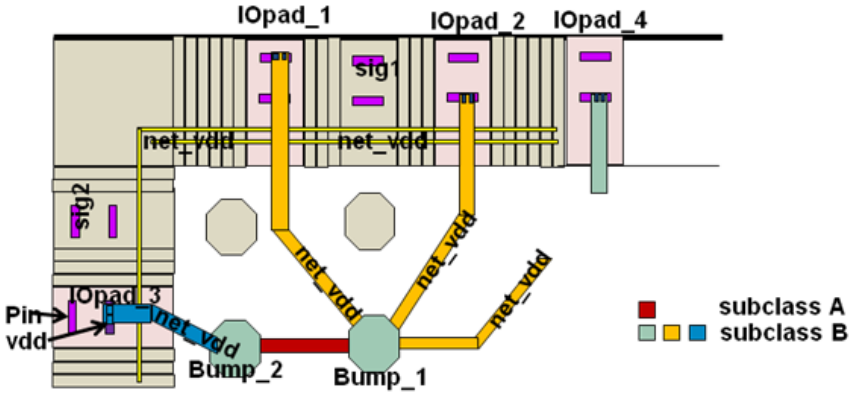
Use this command to check connections after RDL routing, either manual or through `fcroute`.

Parameters

`-help`	Prints a brief description that includes type and default information for each `get_physical_info` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man get_physical_info`
`-highlight`	Highlights the routing path.
`-object string`	Specifies the object from which to get the physical information. For bump, specify the complete bump name.For IO pad, specify one of the following: • *instance_name* • *instance_name*:*pin_name* • *instance_name*:*pin_name*:*port_number*
`-selected`	Gets the physical information for the selected object.
`-subclass {subclass_name_list}`	Specifies the subclass name of the wires and vias to be checked. You can specify multiple subclass names enclosed in braces. You can also use wildcards while specifying subclass names.
`-shapes {RING STRIPE FOLLOWPIN IOWIRE COREWIRE BLOCKWIRE PADRING BLOCKRING FILLWIRE FILLWIREOPC DRCFILL None}]`	
	Specifies the shapes of the wires and vias to be checked. The default value is `IOWIRE`.
`-type {connection | routing_path}`	
	Specifies the type of the physical information to return. The default type is `connection`. • `connection`: Returns the objects that are physically connected to the object you have specified or selected. For example, if you have selected an IO pad, it returns the names of the bump that are connected with the IO pad. If you have selected or specified a bump, it returns the IO pads connected to the bump, using the format *`ioInst:pin:port`*. • `routing_path`: Returns the pointer list of the wires and vias that are physically connected to the object you have selected or specified.

Examples

Consider the following design.



For this design, `get_physical_info` reports information as follows:

- `get_physical_info -object {IOpad_1:vdd:1}`
  Returns `{Bump_1}`
- `get_physical_info  -type connection -object {Bump_1}`
  Returns `{IOpad_1:vdd:1 IOpad_2:vdd:2  Bump_2}`
- `get_physical_info -object {Bump_1} -subclass B`
  Returns `{IOpad_1:vdd:1 IOpad_2:vdd:2}`
- `get_physical_info -type routing_path -object {Bump_2}`
  Returns `{0x2aaaba6c0ab0 0x2aaaba6c0b40 0x2aaaba6c0b70}`

Related Information

getBondPad

```
getBondPad
[-help]
-ioInstName InstName
[-pinName pinName]
```

Gets the current stagger position of a bond pad on a specified I/O instance.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `getBondPad` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man getBondPad`
`-ioInstName instName`	Specifies the name of the I/O instance whose bond pad position is reported.
`-pinName pinName`	Specifies the name of the pin inside the instance.

Example

- The following command gets the current stagger position of the bond pad on the I/O instance `testmacro` with pin `Z2`:
  ```
  getBondPad -ioInstName testmacro -pinName Z2
  ```
  Returns:
  ```
  Pin Name = Z2, Bond Pad Name = testmacro_PAD1, Position = 0, Fixed = 0
  ```

getFlipChipMode

```
getFlipChipMode
[-help]
[-allow_layer_change]
[-auto_pairing_file]
[-bump_use_oct_shape]
[-check_bump_access_directions]
[-compaction]
[-connectPowerCellToBump]
[-constraintFile]
[-drop_via_on_all_geometries]
[-drop_via_on_power_mesh]
[-extraConfig]
[-finger_direction]
[-finger_max_width]
[-finger_min_width]
[-finger_target_mesh_layer_range]
[-honor_bump_connect_target_constraint]
[-ignore_pad_type_check]
[-layerChangeBotLayer]
[-layerChangeTopLayer]
[-lower_layer_prevent_45_routing]
[-lower_layer_route_width]
[-merge_nearby_pin]
[-multi_pad_routing_style]
[-multipleConnection]
[-pg_mesh_direction]
[-pg_mesh_main_width]
[-pg_mesh_max_width]
[-pg_mesh_width]
[-prevent_diagonal_wire_access_bumps]
[-prevent_via_under_bump]
[-prevent_via_under_bump_extension]
[-route_pg_style]
[-route_style]
[-routeWidth]
[-via_abut_bump]
[-via_to_pad_honor_min_spacing]
[-wire_to_pad_honor_min_spacing
[-quiet]
[-nonDefault]
```

Returns information about the specified `setFlipChipMode` parameter in the Innovus log file and the console. The following information is returned:

- Parameter name
- Current value
- Type (Boolean, string, and so on)
- Whether the current value was set by user

If you do not specify a parameter, the software returns information for all of the `setFlipChipMode` mode parameters.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `getFlipChipMode` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man getFlipChipMode`
`parameter_names`	Returns information for the specified parameters. You can specify one or more parameters. See `setFlipChipMode` for descriptions of the flip chip mode parameters you can specify.
`-quiet`	Returns the current settings for the specified parameters in Tcl list format only. If you specify `-quiet` without any parameters, the software returns the current settings of all `setFlipChipMode` parameters in Tcl list format.
`-nonDefault`	Displays the current settings for the parameters that have nondefault settings.

ioInstOverlapCheck

```
ioInstOverlapCheck [-help]
```

Checks to see if any area I/O instance is overlapped with another area I/O instance. If an overlap occurs, a warning message is dumped to the console window, and the overlapped instances are highlighted in the work area.

Parameters

`-help`	Prints a brief description of the `ioInstOverlapCheck` command. For a detailed description of the command, use the `man` command: `man ioInstOverlapCheck`

placeBondPad

```
placeBondPad
[-help]
{-ioInstName instName | -selected}
[-pad padName]
[-pinName pinName]
[-position {i | m | o}]
[-fix]
```

Places a bond pad on a specified I/O instance. It defines the stagger position of a specified bump on a single or selected set of I/O instances.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `placeBondPad` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man placeBondPad`
`-fix`	Assigns a fixed status to the specified bond pad. This restricts other bond pad commands from modifying the bond pad.
`-ioInstName` *name*	Specifies the name of the I/O instance of where the bond pad will be placed.
`-pad` *padName*	Specifies the name of the bond pad.
`-pinName` *pinName*	Specifies the name of the pin inside the instance.
`-position {I | M | O}`	Defines the stagger position of the specified bond pad on the specified I/O instance. You can stagger the position of the bond pad using the inner (`I`), middle (`M`), and outer (`O`) positions.
`-selected`	Places a selected bond pad on the specified I/O instance. You must first select the bond pad in the design display area, then use this parameter to place the bond pad on the specified I/O instance.

- staggerBondPad
- unfixBondPad

readFlipChipProperty

```
readFlipChipProperty
[-help]
fileName
[-onlyBumpConnectTargetConstraint]
```

Reads the text file containing flip chip property information. The `readFlipChipProperty` command prints an error message if the following errors occur:

- Type error of property name
- Instance/pin not found
- Metal layer not found
- Size is zero or minus

Parameters

`-help`	Prints out the command usage that includes type and default information for each `readFlipChipProperty` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man readFlipChipProperty`
`fileName`	Specifies the bump and IO pad property text file.
`-onlyBumpConnectTargetConstraint`	Reads only the bump connect target constraints.

Example

The following command reads only the bump connect target constraints from the `test2` input file:

```
readFlipChipProperty test2 -onlyBumpConnectTargetConstraint
```

Related Information

- `readIoUpdate`
- `writeFlipChipProperty`
- Flip Chip Methodologies chapter of the *User Guide*
- Tools Menu chapter in the *Menu Reference*
  - *Flip Chip*

readIoUpdate

```
readIoUpdate
[-help]
[-checkOnly]
inputFile
```

Reads a simple ASCII file which contains the bump and instance information.

The input die abstract file is a simple ASCII file that consists of bump and I/O instance information only; these are the only two objects that can be modified by SiP Layout.

- If a bump is defined in the db and not defined in the input file, the bump gets deleted from the db.
- If the instance names in the input file and db do not match, an error is displayed.
- If the nets referenced in the bump section in the input file do not exist in the db, an error is displayed.

Parameters

`-help`	Prints out the command usage that includes type and default information for each `readIoUpdate` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man readIoUpdate`
`-checkOnly`	Reports differences between the input file and the design in memory. This is an optional parameter. This parameter only generates a report and does not update the die.
`inputFile`	Specifies a file containing the state of I/O drivers and bumps (placement and assignments). This is a required parameter. The information from this file is updated in the database.

Related Information

- `readFlipChipProperty`
- `readPackage`
- `writeFlipChipProperty`
- Flip Chip Methodologies chapter in the *User Guide*
- Tools Menu chapter in the *Menu Reference*
  - *Flip Chip*

readPackage

```
readPackage
[-help]
packageFile
```

Reads the package file dumped out by the System-in-Package (SiP) layout in XML format and displays the package ball/finger location in the Innovus floorplan view. The command also displays the flight lines from the IO pads to fingers for a wire-bond design or from bumps to package balls for a flip chip design.

The package overlay schema dumped out by SiP includes bond finger, package balls, and many other package objects. `readPackage` displays all the package objects for a wire-bond or flip chip design, such as BGA_BALL, BOND_FINGER, BONDWIRE and ROUTE, in the Innovus main window. The exact information displayed depends on the package overlay file dumped out by SiP. You can turn on or turn off the display of specific package objects using the Custom tab of the Color Preferences form in Innovus. You can view attributes of a selected package object using Attribute Editor.

Parameters

`-help`	Prints out the command usage that includes type and default information for each `readPackage` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man readPackage`
`packageFile`	Specifies the name of the package file.

Related Information

- `readIoUpdate`
- Flip Chip Methodologies chapter in the *User Guide*

reportProbePins

```
reportProbePins [-help]
```

Generates a report of all probe pins that are used for package-level design and testing. If no probe points exist, the software returns the following message:

```
"No Probe Points Defined"
```

Note: You can set or delete probe points using the `setProbePin` or `unsetProbePin` commands, respectively.

Parameters

`-help`	Prints a brief description of the `reportProbePins` command. For a detailed description of the command, use the `man` command: `man reportProbePins`

Example

- The following command generates a report of all probe pins:
  `reportProbePins`

Related Information

- `setProbePin`
- `unsetProbePin`

reportSpecialRoute

```
reportSpecialRoute
[-help]
reportName
[-center_line]
[-net netName]
[[ [-by_layer]
   [-highlight45layer layerName]
   [-lengththreshold value]
   [-resfile resFileName]
   [-selected]
   [-summary]
   [-wire_segment]
   [-wirelength]   ]
 | [-interposer_route
   [[-exclude_nets netName]
    [-interposer_layers layerName]
    [-interposer_route_constraint_file ircFileName]]]]
```

Reports the length of all RDL routes (SPECIALNETS) created with the `fcroute` command. This includes support for Manhattan and 45-degree routes. You can report the wire length of each SPECIALNET and report the SPECIALNETS that are greater in length than the specified threshold value.

Use the `-by_layer` and `-wire_segment` options to report the width and length of the special nets per layer and wire segment.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reportSpecialRoute` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man reportSpecialRoute`

`-by_layer`	Reports on layers of each special net. Here's a sample format of the report when the `-by_layer` option is specified:
	`NET: port_pad_data_in[0] TOTAL SEGMENTS 4 WIRE LENGTH 303.4980 VIAS 1`
	`LAYER 8(METAL8) TOTAL LENGTH 303.4980`
	`IOWIRE SEGMENTS 4 WIRE LENGTH 303.4980 VIAS 1`

`-center_line`	Specifies that routing length is calculated by center line. That is, the sum of wire center line is used to calculate wire length. Without this parameter, the routing length is calculated as sum of wire segments. Sum of wire center line Sum of wire segments
`-exclude_nets netName`	
	Specifies the net names to be excluded. This option can be used only if `-interposer_route` is specified.
`-highlight45layer layerName`	

	Highlights (in yellow) all nets with 45-degree routing on the specified layer in the design display area.
`-interposer_layers` *layerName*	
	Specifies the interposer layers. Use this option to report the maximum and minimum routing length from tap via to tap via and from bump to tap via by layer. This option can be used only if `-interposer_route` is specified.

`-interposer_route`	Reports the interposer route statistics, including maximum, minimum, and average wire length of the interposer routing. `reportSpecialRoute` reads the constraints defined by `setIntegRouteConstraint` to decide which nets are in one group. The `setIntegRouteConstraint` constraints are either obtained from the DB or can be specified through a file by using the `-interposer_route_constraint_file` option.
	The report format is as shown below:
	`### Header ###`
	`### Total Nets of Interposer Route ###`
	`Total nets: <total nets number>`
	`Layer: Layer_name`
	`Net with Max wire length: <net name + net length>`
	`Net with Min wire length: <net name + net length>`
	`Average wire length:`
	
	`### Net Group <group_name1> ###`
	`Total nets: <nets number in group>`
	`Layer: Layer_name`
	`Net with Max wire length:`
	`<net name> :`
	`net length :`
	`Euclidean distance:`
	`Manhattan distance:`
	`Net with Min wire length:`
	`<net name> :`
	`net length :`
	`Euclidean distance:`
	`Manhattan distance:`
	`Average wire length:`
	`Nets name:`
	
	`### Net Group <group_name2> ###`
	`Total nets: <nets number in group>`
	`Layer: Layer_name`
	`Net with Max length: <net name + net length>`

	... Net with Min length: <net name + net length> ... Average wire length: Nets name: ... The *group_name* of the nets is obtained from `setIntegRouteConstraint -name group_name`. If `-name` is not specified, the tool uses a number to mark the net group. For example: `### Net Group <1> ###`
`-interposer_route_constraint_file` *ircFileName*	
	Specifies the name of the interposer route constraint file. This option can be used only if `-interposer_route` is specified.
`-lengththreshold` *value*	
	Reports on the `SPECIALNETS` that are greater in length than the specified value. These values are listed in the output file specified by *reportName* and the routes are highlighted in the GUI.
`-net` *netName*	Reports on the wire length of each `SPECIALNET` fora specified net. **Note:** You must use this parameter in conjunction with the `-wirelength` or `-lengththreshold` parameters.
reportName	Specifies the report file name.
`-resfile` *resFileName*	
	Specifies the resistance file name (`fcroute.res`) generated by `fcroute` if `srouteFCReport` *file name* is specified in the config file and highlights the violated nets on GUI when the resistance does not match the max resistance constraint defined in the `fcroute` constraint file.
`-selected`	Reports the length of the selected wire segments for each special net.

`-summary`	Summarizes the wire length and VIAs for special nets. Here's a sample format of the report when `-summary` is specified:
	
	`----------`
	
	`----------`
	`Report wire length and VIAs per layer`
	`----------`
	` 8(METAL8)  Total wire segments 15 Total length 1243.527000`
	`  ----------`
	`    #Shape           Wire segment    Length`
	`     Horizontal      5                 297.6950`
	`     Vertical        5                 466.4500`
	`     45degree        5                 479.3820`
	`  ----------`
	`cutlayer VIA78 Total VIAs: 4 Total Cuts: 1360`
	
	`----------`
	
	`----------`
	`Report wire length per shape for all layers`
	`----------`
	` #Shape           Wire segment    Length`
	`  Horizontal      5                 297.6950`
	`  Vertical        5                 466.4500`
	`  45degree        5                 479.3820`
	`----------`
	
	`Total Wire Length of All Special Nets: 1243.5270`

`-wire_segment`	Reports on the wire segments of each special net. Here's a sample format of the report when `-wire_segment` is specified:
	
	`NET: port_pad_data_in[1] TOTAL SEGMENTS 4 WIRE LENGTH 251.9120 VIAS 1`
	`WIRESEGMENT 1 SHAPE Vertical LENGTH 110.7050 674.7200 880.7200 686.7200 991.4250`
	`WIRESEGMENT 2 SHAPE 45degree LENGTH 76.3320 620.7450 985.4250 686.7200 1051.4000`
	`WIRESEGMENT 3 SHAPE Horizontal LENGTH 38.3550 588.3900 1039.4000 626.7450 1051.4000`
	`WIRESEGMENT 4 SHAPE Vertical LENGTH 26.5200 588.3900 1039.4000 597.3900 1065.9200`
	`IOWIRE SEGMENTS 4 WIRE LENGTH 251.9120 VIAS 1`

`-wirelength`	Reports on the wire length of each `SPECIALNET`.

Example

- The following command reports the wire length of each `SPECIALNET` and lists it in the `spwire.rpt` report file:
  `reportSpecialRoute spwire.rpt -wirelength`

Example report file:

```

routePointToPoint

```
routePointToPoint
[-help]
[-constraintFile filename]
[-drop_via_in_trace]
[-net {[netName | -1] [layerName | -1] [(x y)]}]
[-pin {[instName | -1] [pinName | -1] [(x y)]}]
[-routeLayer {bot[:top[:step]] [,bot[:top[:step]]]}]
[-routeStyle {manhattan | doubleBend | diagonal}]
[-spacing spacingValue]
[-split {layerBase maxWidth:value [gap:value] [style:RIVER|MESH]}]
[-subclass subclass_name]
[-width widthValue]
[{[-useExactLoc] [-guidePoint {{x1 y1} {x2 y2}...} [-keep_partial]]} [-offset {x y}]]
```

Specifies routing constraints to perform point-to-point routing between I/O pad pins and bumps, and wires and bumps for SPECIALNETS (only) that are defined in the DEF file.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `routePointToPoint` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man routePointToPoint`
`-constraintFile` *`fileName`*	Specifies the name of the file that contains the nets defined in the DEF file.
`-drop_via_in_trace`	Drops all possible vias in the trace.
`-guidePoint {{x1 y1} {x2 y2}...}`	
	Specifies guiding points for routing. *`x`* and *`y`* values are real values in micron. You can specify up to 256 guiding points. The P2P router routes through all the usable guiding points in an order of distance to/from target. This feature allows you to control P2P router more precisely on pin selection.
`-keep_partial`	Keeps routed segments when routing with guide points fails partially. **Note:** This parameter can be used only with `-guidePoint`.
`-net {netName | -1 [layerName | -1] (x y)}`	
	Specifies net options, such as net name, net layer, and location coordinates. The *`layerName`* can now also be the TSV layer name.
`-offset {x y}`	Defines the maximum search offset from the original user click location. **Note:** This parameter can be used only with `-useExactLoc`.
`-pin {[instName | -1] [pinName | -1] [(x y)]}`	
	Specifies the pin options, such as the instance name, the pin name, or the location coordinates.
`-routeLayer {bot[:top[:step]] [,bot[:top[:step]]]}`	

	Specifies the route layer.
`-routeStyle [manhattan | doubleBend | diagonal]`	
	Specifies the routing style options for performing the point-to-point routing. • `diagonal`  • `manhattan`  • `doubleBend` `-spacing` *`spacingValue`*	Specifies the route spacing, in micrometers.
`-split {layerBase maxWidth:`*`value`* `[gap:`*`value`*`] [style:RIVER|MESH]}`	

	Splits the wire segment based on the maximum width and splitting style.
	The router gets the maximum width value from the layer information; the router does not split the wire segment when the wire width does not exceed the layer's maximum width.
	• `maxWidth:`*`value`*: `Specifies the maximum width for splitting.`
	• `gap:`*`value`*: Specifies the splitting gap.
	• `style:RIVER|MESH`:Specifies the splitting style:
	  ◦ `RIVER`: Allows only one crossing of the split wire.
	  ◦ `MASH`: Allows crossing of all of split wires and also drops all the crossing sections.

`-subclass` *`subclass_name`*	Assigns the specified string as a subclass name to the wires and vias created.

`-useExactLoc`	Uses the exact location that you click to perform routing. You can use the optional -offset parameter to define the maximum search offset from the original user click location. If the location does not fulfill the pin access requirements, P2P router performs an auto search to find a new access point. **Note:** If the `-useExactLoc` parameter is not specified, P2P finds the start end locations on the user-clicked object on its own.
`-width` *widthValue*	Specifies the route width, in micrometers.

Examples

The following command performs diagonal style point-to-point routing between the I/O pad pin `newIo_2` and bump `Bump_41_0_4` on route layer `M8`, having a default route width of `0.44` micrometers, and a spacing of `0.46` micrometers:

```
routePointToPoint -routeLayer M8:M8 -width 0.44 -spacing 0.46 -routeStyle diagonal -pin {newIo_2 -1 (-21.3115
535.932)} -pin {Bump_41_0_4 port_pad_data_in[10] (76.507 482.032)}
```

select_bump

```
select_bump
[-help]
[-alternate {row column}]
[-area {{x1 y1 x2 y2} ...}]
[-assigned]
[-bump_cell {cell_list}]
[-bumps {bump_list}]
[-floating]
[-max_distance_to_side distance]
[-nets {net_list}]
[-side {top bottom left right}]
[-start_lower_left]
[-type {signal power ground}]
```

Enables you to select bumps in different ways. For example, you can select bumps by type or by net. By default, selects all bumps in the design.

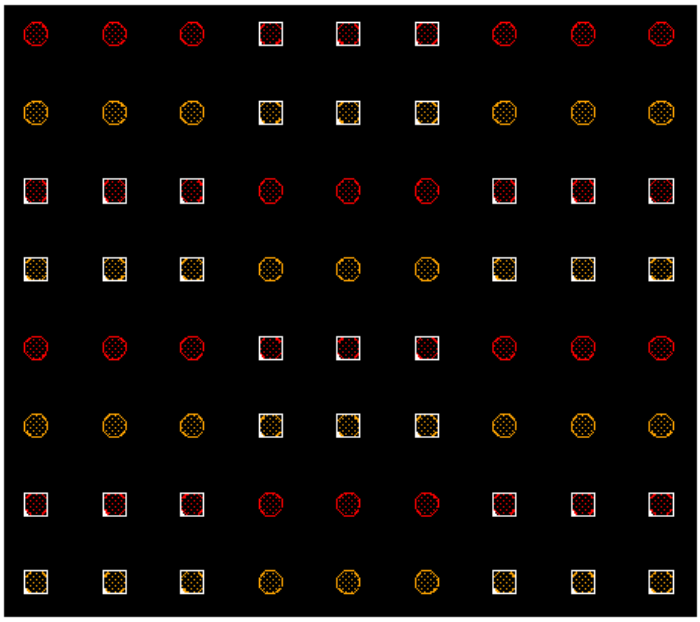
Parameters

`-help`	Prints a brief description that includes type and default information for each `select_bump` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man select_bump`
`-alternate {row column}`	Specifies the alternate bump pattern. You have to preselect the area in which the bumps are to be alternate-selected before using this option.
`-area {{x1 y1 x2 y2} ...}`	Specifies one or more areas from which bumps are to be selected.
`-assigned`	Selects only the bumps that are assigned.
`-bump_cell {cell_list}`	Specifies names of bump cells and the bumps with these bump cells are selected. You can use wildcards in the bump cell list.
`-bumps {bump_list}`	Specifies names of the bumps to be selected. You can use wildcards in the bump list.
`-floating`	Selects only unassigned or floating bumps.
`-max_distance_to_side distance`	
	Specifies the maximum distance away from the side in microns. When specified, only the bumps with geometries completely in that region are selected. By default, half the width/height of the die is used as the maximum distance to each side. For *distance*, minimum value is `0` and maximum is `1e+20`.
`-nets {net_list}`	Specifies names of nets and the related bumps are selected. You can use wildcards in the net list.
`-side {top bottom left right}`	
	Specifies the side relative to which bumps are selected.
`-start_lower_left`	
	Specifies the start point of alternate selection. If it is not specified, the lower-left point is considered the start point of alternate deselection. **Note**: This parameter can only be used with `-alternate`.
`-type {signal power ground}`	
	Specifies the type of bumps to be selected.

Examples

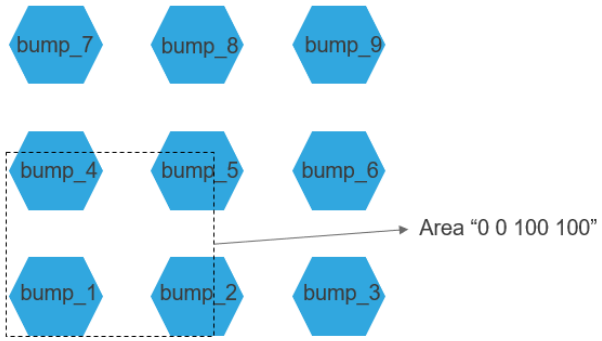
- The following command selects all bumps in the design:
  ```
  select_bump
  ```
- The following command selects the bottom edge of bump geometry no more than 500 microns away from the top side:
  ```
  select_bump -side top -max_distance_to_side  500
  ```
- After selecting all the bumps in a design or in a specific area, use the following command to alternately select a 2x3 bump pattern starting from the lower left corner:
  ```
  select_bump -alternate {2 3} -start_lower_left
  ```

The resulting selection pattern is shown below.



- The following command selects four bumps, `bump_1`, `bump_2`, `bump_4`, and `bump_5`, as shown below:

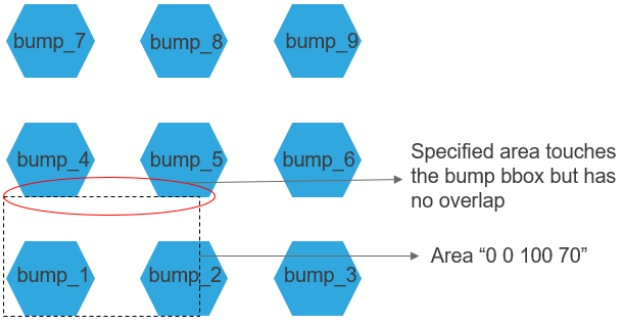
```
select_bump -area {0 0 100 100}
```



Bumps generated by `create_bump`

- The following command selects two bumps, `bump_1` and `bump_2`, as shown below. Note that although the specified area touches the bump bounding box (bump bbox), there is no overlap:

```
select_bump -area {0 0 100 70}
```



Bumps generated by `create_bump`

setBumpFixed

```
setBumpFixed
[-help]
{-allBumps | -byBumpName {list} | -byBumpSite {list}}
```

Fixes a specified group of assigned bumps to keep them from being reassigned. The software updates the DEF file by adding the `+FIXEDBUMP` attribute to the specified group of assigned bumps to indicate that they are now in a fixed state. You can use the `defOut` command to view the bumps with the `+FIXEDBUMP` attribute. Use this command after bumps are assigned with the `assignBump` command or defined in the I/O file with the signal name.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setBumpFixed` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setBumpFixed`.
`-allBumps`	Fixes all of the assigned bumps.
`-byBumpName list`	Fixes the assigned bumps that are specified in the bump name *`list`*.
`-byBumpSite list`	Fixes the assigned bumps that are specified in the bump site *`list`*.

Example

- The following command fixes all of the assigned bumps:
  ```
  setBumpFixed -allBumps
  ```

setBumpPlacementStatus

```
setBumpPlacementStatus
[-help]
[-bumpName Name | -selected]
PLACED | FIXED | COVER
```

Sets the bump placement status.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setBumpPlacementStatus` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setBumpPlacementStatus`.
`-bumpName Name`	Specifies the name of the bump to set the placement status.
`PLACED | FIXED | COVER`	Specifies the bump placement status.
`-selected`	Specifies to set the bump placement status for the selected bump.

Example

- The following command sets the placement status of the bump `Bump_53_2_5` to `FIXED`:
  `setBumpPlacementStatus FIXED -bumpName Bump_53_2_5`

  Note: You can also double-click the bump to change the placement status from `PLACED` to `FIXED`.

```

Loads data for `placePIO` and `fcroute` commands. Both, `placePIO -optIOs -assignBump -noRandomPlacement` and `fcroute` commands use the same data for I/O optimization, bump assignment, and flip chip routing.

> You need to first execute `setFlipChipMode` command followed by `placePIO`, and `fcroute` commands.

Use the `getFlipChipMode` command to return the current settings for the `setFlipChipMode` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setFlipChipMode` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setFlipChipMode`
`-reset`	Resets parameters to their default values. The `-reset` parameter *must* be the first parameter specified. If you specify `-reset` by itself, the software resets all `setFlipChipMode` parameters to their default values. Any values that do not already match the default value and are reset will be reported. If you specify parameters after `-reset`, the software resets only those parameters to their default values.
`-allow_layer_change {true | false}`	

	Turns on the layer change feature, when set to `true`. Only the PIO mode supports this feature. Both Manhattan and 45-degree routing support this constraint.
	Different setting for routing layers will have the different behaviors as shown in the following examples. Assume the top RDL is `TOP_RDL` and the second top RDL is `2nd_RDL`:
	• Use `TOP_RDL` as much as possible and `2nd_RDL` is used only when a single layer cannot finish routing in case of cross-over:
	`-layerChangeBotLayer TOP_RDL -layerChangeTopLayer TOP_RDL`
	• Freely change layers so that the tool will use the layer resources by its intelligence
	`-layerChangeBotLayer 2nd_RDL -layerChangeTopLayer TOP_RDL`
	Default : `false`

`-auto_pairing_file` *fileName*	

	Makes `fcroute` dump out auto-pairing information. This enables you to check whether or not `fcroute` auto pairing and optimize pairing result based on the port number property.
	Depending on the design, the format of the output file can be as follows:
	• If the connection between the bump and the instance is known, the format is:
	`addBumpConnectTargetConstraint -bump bumpName -instName instName`
	• If the connection between the bump and the instance pin is known, the format is:
	addBumpConnectTargetConstraint -bump bumpName -instName instName -pinName pinName
	• If the connection between the bump and the pin port of the instance is known, the format is:
	`addBumpConnectTargetConstraint -bump bumpName -instName instName -pinName pinName -portNum portNumber`
	See Examples section for an example.

`-bump_use_oct_shape {true | false}`	

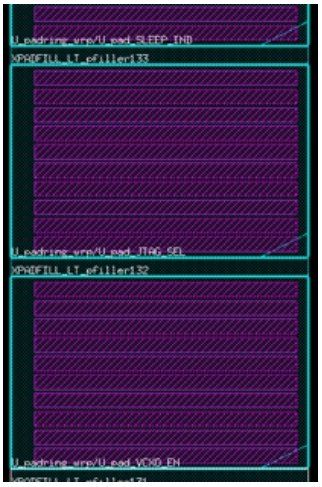
	Controls how `fcroute` handles special bumps with multiple shapes:
	• When this parameter is set to `true`, the tool uses an octagonal shape to mimic the special bump.
	• When this parameter is set to `false`, the tool:
	  ◦ Uses the bump's exact LEF description if the bump is simple enough.
	  ◦ May replace the bump shape with an octagonal shape if the bump is not simple according to the tool's internal criterion.
	Note: When the special bump is replaced with an octagonal shape, the routing quality may be improved, but there may be DRC violations.
	Default : `false`

`-check_bump_access_directions {true | false}`	
	Specifies whether `fcroute` should check the access direction of bump cells. Use this parameter if you have an octagonal bump pad structure with a pre-drawing wire for outside access, where the pre-drawing wire is a pin in the bump LEF. When `-check_bump_access_directions` is set to `true`, `fcroute` checks the bump LEF to detect the bump access direction before routing. Then, `fcroute` connects the pad to the bump pre-routed wire based on this direction. If the pre-routed wire is a 45-degree wire, the `manhattan` routing style is not supported. Note that one bump cell can have multiple access directions. **Note**: The `-check_bump_access_directions` parameter is applicable only for `fcroute -type signal`. If this option is used for `fcroute -type power`, `fcroute` will ignore the setting and display a warning. *Default*: `false`
`-compaction {true | false}`	
	Turns on compaction routing, when set to `true`. In the flip chip post-route stage, the compaction function pushes the routing as close as possible to bumps in order to leave more routing resource for subsequent routing steps, such as P/G bump connections or general power routing. **Note**: This feature cannot be used with resistance driven and diffpair routings because the compaction action may change the wire length and routing pattern. This feature does not support two-layer RDL routing. *Default* : `false`
`-connectPowerCellToBump {true | false}`	

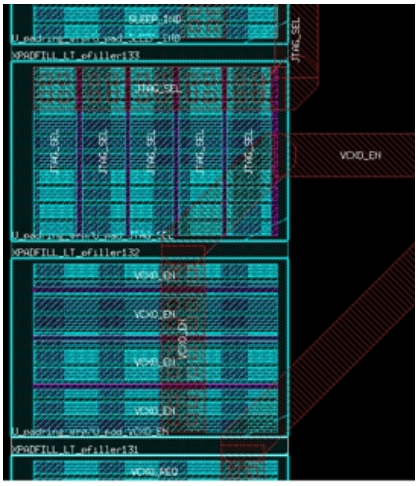
	Connects all power bumps to the I/O cell pin. It does not connect to a power or ground stripe or ring.
	When used with the `fcroute -type signal` parameter, you can connect power bumps to I/O power pads. To make this type of connection, you need the following information:
	• The Verilog netlist must contain the I/O power pad, for example:
	VDDCELL VDD_INST (.PAD());
	• The LEF macro pin must contain the USE POWER statement, for example:
	MACRO VDDCELL
	PIN PAD
	USE POWER;
	To improve the quality of routing in situations where there may be many power bumps in the design, you can pair power bumps to power cells by using this parameter in conjunction with the `fcroute -constraintFile` parameter. For example:
	`setFlipChipMode -connectPowerCellToBump true -constraintFile pair.const`
	where *pair.const* specifies the following information:
	`### Syntax: net pad [pad2] bump [bump2] ###`
	`PAIR`
	`VDD IOPADS_INST/esd Bump_90_9_8`
	`END PAIR`
	Default: `false`

`-constraintFile fileName`	
	Specifies the file that contains constraints for flip chip routing. For more information, see "*Useful Constraints for Flip Chip Routing*" in the Flip Chip Methodologies chapter of the *Innovus User Guide.*
`-drop_via_on_all_geometries {true | false}`	

Drops vias on all defined geometries. Consider the pin shape below.



For the given shape, the routing result will be as follows when `-drop_via_on_all_geometries` is set to `true`:



Default: false

`-drop_via_on_power_mesh` *layerName*

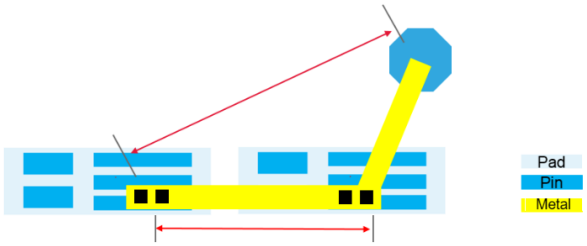
	Specifies the number or name of the metal layer that can be used by the tool for dropping a via on a PG mesh. `fcroute` automatically drops a via on the PG mesh on the specified metal layer if the PG RDL route crosses the PG mesh. For example:
	`setFlipChipMode -drop_via_on_power_mesh M6`
	`setFlipChipMode -connectPowerCellToBump true`
	`fcroute -type signal -designStyle pio`
	 	
	The via is dropped only if there is no DRC violation due to the via drop.
	Note: The `-drop_via_on_power_mesh` parameter does not affect the routing results from PG bumps to pad.
	Default: `""`

`-extraConfig` *`fileName`*	Specifies the name of an extra configuration file that uses options defined in `sroute`.
`-finger_direction {N|E|S|W}`	
	Specifies the main expansion direction for PG finger routing. The default direction is North. *Default*: `N`
`-finger_max_width` *`real_value`*	
	Specifies the maximum routing width for one wire segment of the PG finger. By default, there is no constraint on the max width; `fcroute` uses `MAXWIDTH` in LEF. If this constraint is not specified in LEF, `fcroute` uses the maximum width possible. If there is a conflict between the user-specified constraint and the LEF rule, the LEF rule is used as the maximum width. *Default*: `0`
`-finger_min_width` *`real_value`*	

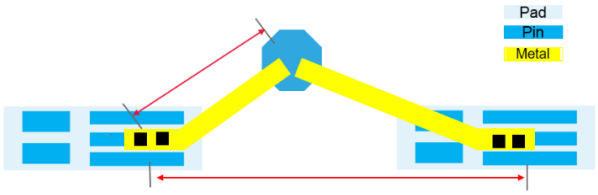
	Specifies the minimum routing width for one wire segment of the PG finger. The default is the RDL minimum width defined in LEF. If there is a conflict between the user-specified constraint and the LEF rule, the LEF rule is used as the minimum width. *Default*: `0`
`-finger_target_mesh_layer_range {`*`topLayer`* `[`*`bottomLayer`*`]}`	
	Specifies the target mesh layer range of the power mesh that will be connected for finger routing. If not specified, no layer of the power mesh will be connected. *Default*: ""
`-honor_bump_connect_target_constraint {true | false}`	
	Enables port numbering routing, when set to `true`. *Default*: `false`
`-ignore_pad_type_check {true | false}`	
	Specifies whether or not CLASS PAD cells are supported in the flip chip flow. When set to `true`, this option equals with following settings: • `set flipchip_allow_class_pad true` • `PADANYTYPE` in the `fcroute` constraint file • `srouteGrouteCheckPadClass FALSE` in the `fcroute` extra configuration file. *Default*: `true`
`-layerChangeBotLayer` *`layerName`*	
	Specifies the bottom-most metal layer that the software can use when routing bumps. You can specify the layer either by layer number or layer name.
`-layerChangeTopLayer` *`layerName`*	
	Specifies the top-most metal layer that the software can use when routing bumps. You can specify the layer either by layer number or layer name.
`-lower_layer_prevent_45_routing {true | false}`	
	Prevents 45-degree routing for lower layer, when set to `true`. *Default*: `false`
`-lower_layer_route_width` *`value`*	
	Specifies a different width value for the lower routing layer. The unit is in microns. *Default* = 0, *Min* = 0.000000, *Max* = 10000000000.000000
`-merge_nearby_pin {true | false}`	
	Merges pins that are close but not touching. *Default*: `false`
`-multi_pad_routing_style {default | serial | star}`	
	Specifies the routing style for multi-pad routing:

- `default` - The flip chip router (`fcroute`) connects a bump to multiple pads with multiple different wires as shown below:

- `serial` - `fcroute` connects a bump first to one pad and then to the other pad, as shown below, provided that the distance from the bump to either pad is more than the distance between the two pads:

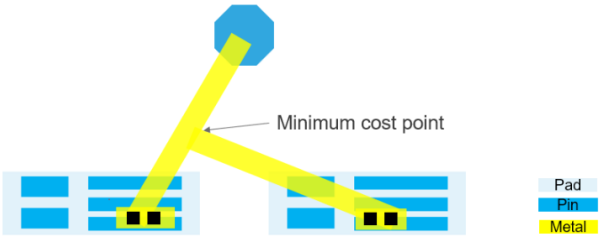


If the distance from the bump to any pad is shorter than the distance between the two pads, `fcroute` reverts to the default behavior of multiple wire connection even if `-multi_pad_routing_style` is set to `serial`.



This mode supports only two-pad routing.

- `star` - `fcroute` connects a bump first to the closest pad. It then finds a minimum cost point on its routing path and connects this point to another pad as shown below:



The minimum cost point could be anywhere on the first routing path, including its beginning and end.

Both the `serial` and `star` modes are useful for saving routing resources in complex designs as they share the routing between pads. However, the `serial` mode supports only two-pad routing. Use the `star` mode if you want to route more than two pads.

Note: The `setFlipChipMode -multi_pad_routing_style` works only if the `setFlipChipMode -multipleConnection multiPadsToBump` is specified. For example, to use `star` mode, you should specify the following commands before running `fcroute`:

```
setFlipChipMode -multipleConnection multiPadsToBump
setFlipChipMode -multi_pad_routing_style star
```

Default: `default`

`-multipleConnection {multiPadsToBump | multiBumpsToPad | default}`

Specifies routing connections between multiple pads and bumps.

- `multiPadsToBump` - Enables routing from multiple pads to one bump in parallel. This parameter is supported by both, `fcroute` AIO and PIO routing styles.
- `multiBumpsToPad` - Enables routing from multiple bumps to one pad in parallel. This parameter is supported by both, `fcroute` AIO and PIO routing styles.
- `default` - Enables routing from one bump to one pad in parallel. This means there is no multiple connection.

Default: `default`

`-pg_mesh_direction {default | horizontal | vertical}`

Specifies the main routing direction of the PG mesh. You can specify one of the following values for this option:

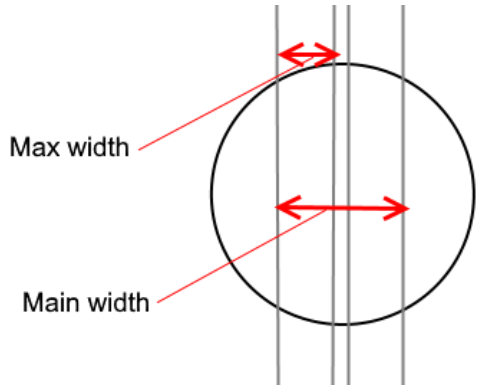
- `default` - Uses the preferred routing direction defined in the Tech LEF.
- `horizontal` - Uses the horizontal routing direction.
- `vertical` - Uses the vertical routing direction.

The `-pg_mesh_direction` parameter can be used only if `-route_pg_style mesh` is specified.

Default: `default`

`-pg_mesh_main_width` *`real_value`*

Specifies the main width of the PG mesh. This option can be used only if `-route_pg_style mesh` is specified.



Default: `0`; *Min*: `0`; *Max*: `10000000000`

`-pg_mesh_max_width` *`real_value`*

	Specifies the maximum width of the routing wire in a PG mesh. This option can be used only if `-route_pg_style mesh` is specified. By default, there is no constraint on the maximum width. `fcroute` uses `MAXWIDTH` in the Tech LEF. If there is a conflict between the value you specify and the LEF rule, the tool uses the LEF rule as the maximum width. *Default*: `0`; *Min*: `0`; *Max*: `10000000000`
`-pg_mesh_width` *value*	Specifies the exact routing width of the PG mesh. This option can be used only if `-route_pg_style mesh` is specified. If only one value is specified with `-pg_mesh_width`, the value is applicable for the width of both horizontal and vertical wires. If two values are specified, the first value is applicable for the width of horizontal wires and the second value is applicable for the width of vertical wires. *Default:* `""`
`-prevent_diagonal_wire_access_bumps {true | false}`	
	Specifies whether or not diagonal wires can be used to access bumps. *Default:* `false`
`-prevent_via_under_bump {true | false}`	
	Specifies that vias are generated next to the bump instead of directly on the bump. If you do not specify this parameter, vias generated connect directly to the bump. This option is available for both signal and power bumps (`fcroute -type signal` and `fcroute -type power`, respectively.) *Default:* `false`
`-prevent_via_under_bump_extension` *real_value*	
	Specifies a spacing value to define an extension area around the bump in which vias should not be dropped. The spacing value must be greater than or equal to `0`. This parameter can be used only if `-prevent_via_under_bump` is set to `true`. Check the **Examples** section to see how this parameter can be used in conjunction with `prevent_via_under_bump` to control the spacing around bumps when vias are dropped. *Default:* `0`
`-route_style {manhattan | 45DegreeRoute}`	
	Determines the type of routing, either `manhattan` or `45DegreeRoute`. *Default*: `45DegreeRoute` **Note:** `45DegreeRoute` does not work in conjunction with the following `fcroute` parameter: • `-doubleBendRoute`
`-route_pg_style {none | finger | mesh}`	

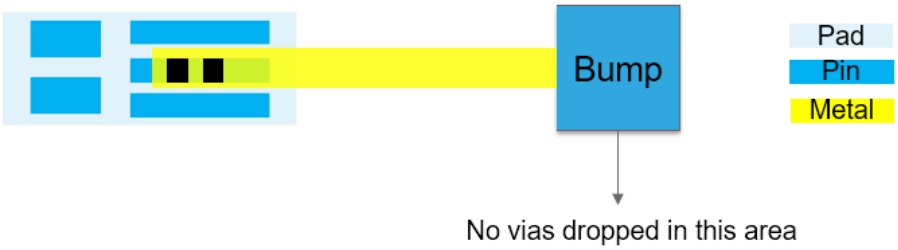
	Specifies the routing pattern for `fcroute -type power` routing: • `none`: For normal PG routing • `finger`: For PG finger routing style, in which you need to specify the routing direction. This option must be used with `fcroute -area` option. • `mesh`: For mesh-style PG routing on the redistribution layer (RDL). This option is used to increase PG density. If you specify PG mesh routing, you must specify the main width of the PG mesh by using the `-pg_mesh_main_width` parameter. *Default:* `none`
`-routeWidth` *`real_value`*	Specifies the routing width. Wires are connected to bumps using the specified route width not wider than the I/O pad pin. *Default*: 0
`-via_abut_bump {true | false}`	

	Specifies that via should abut the bump only if routing can be done successfully. • With `-via_abut_bump` set to `true`  • Without `-via_abut_bump` set to `true`  In this case, via is dropped inside bump as shown above. This is the default setting. *Default*: `false`
`-wire_to_pad_honor_min_spacing` *`float_value`*	
	Specifies the minimum spacing between the bump/pad and a wire. *Default*: 0

Examples

- The following examples illustrate how the `-prevent_via_under_bump` and `-prevent_via_under_bump_extension` parameters can be used to control the spacing around bumps when vias are dropped:
  - In the example below, no vias are dropped directly under the bump as `-prevent_via_under_bump` is set to `true`:

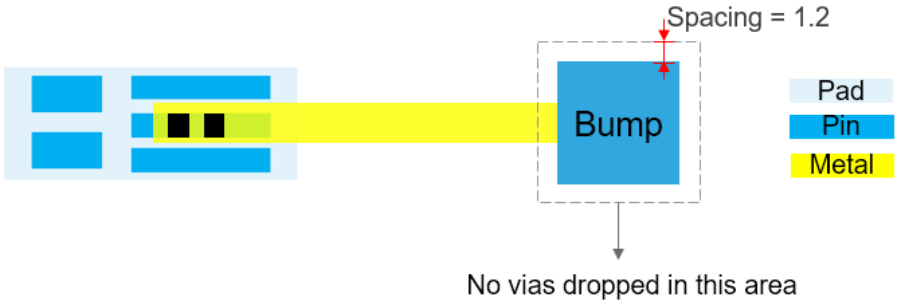
```
> setFlipChipMode -prevent_via_under_bump true
> fcroute -type signal -designStyle pio
```



Additionally, if `-prevent_via_under_bump_extension` is set to `0`, the same result is achieved.

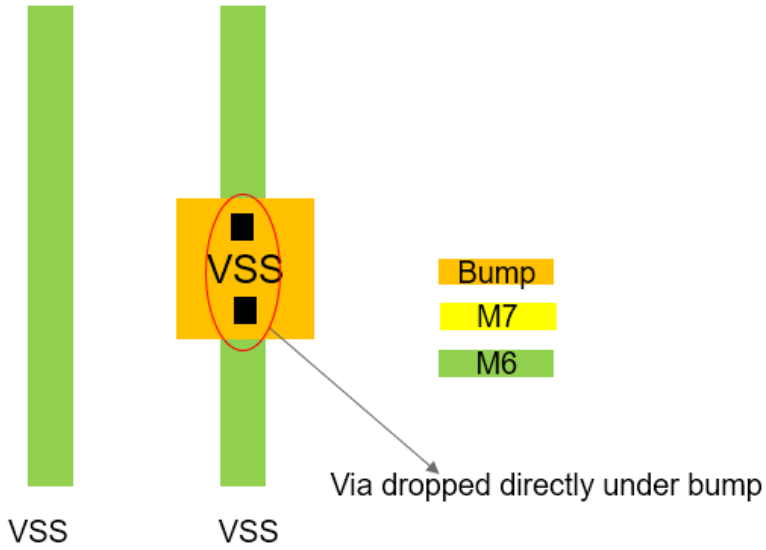
- In the example below, no vias are dropped in the extension area defined around the bump:

```
> setFlipChipMode -prevent_via_under_bump true
> setFlipChipMode -prevent_via_under_bump_extension 1.2
> fcroute -type signal -designStyle pio
```



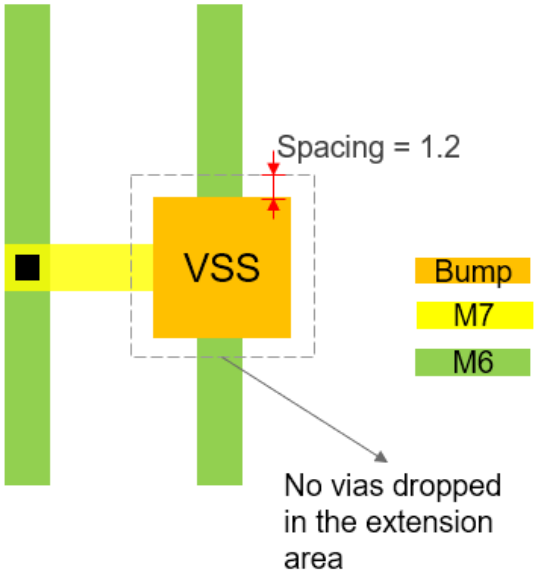
- In the example below, vias are dropped directly under the power bumps as `-prevent_via_under_bump` is set to `false`:

```
> setFlipChipMode -prevent_via_under_bump false
> fcroute -type power
```



- In the example below, no vias are dropped in the extension area defined around the power bumps:

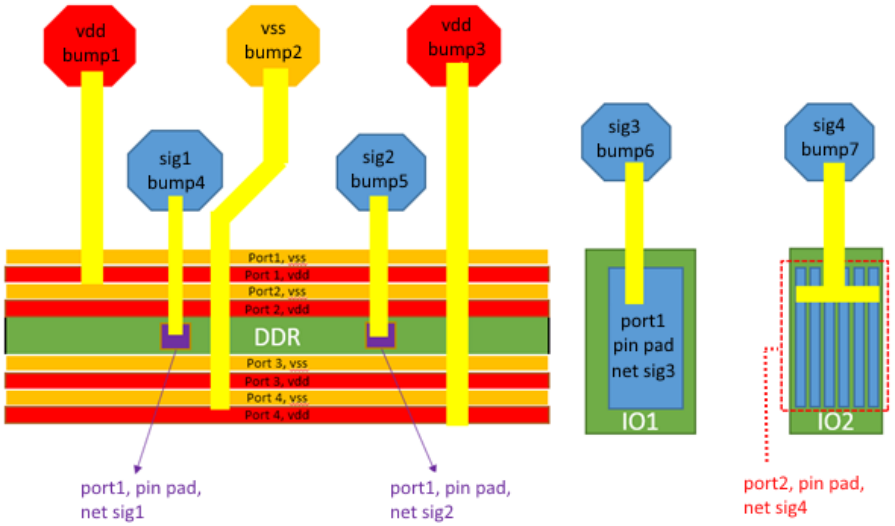
```
> setFlipChipMode -prevent_via_under_bump true
> setFlipChipMode -prevent_via_under_bump_extension 1.2
> fcroute -type power
```



- The following command specifies the flip chip constraints in the constraint file `CFG/ res.constr` enabling routing from a single bump to single power cell in parallel, having a route width of `10` micrometers on the metal layer `8`:

```
setFlipChipMode -connectPowerCellToBump true \
-constraintFile CFG/res.constr \
-extraConfig CFG/ex.cfg \
-layerChangeBotLayer 8 \
-layerChangeTopLayer 8 \
-multipleConnection default \
-routeWidth 10
```

- Consider the connection displayed below.



For this connection, the `setFlipChipMode -auto_pair_file pair.rpt` command generates the following report:
In `pair.rpt` file:

```
addBumpConnectTargetConstraint -bump bump1 -instName DDR -pinName vdd -portNum 1
addBumpConnectTargetConstraint -bump bump2 -instName DDR -pinName vss -portNum 4
addBumpConnectTargetConstraint -bump bump3 -instName DDR -pinName vdd -portNum 4
addBumpConnectTargetConstraint -bump bump4 -instName DDR -pinName pad -portNum 1
addBumpConnectTargetConstraint -bump bump5 -instName DDR -pinName pad -portNum 1
addBumpConnectTargetConstraint -bump bump6 -instName IO1 -pinName pad -portNum 1
addBumpConnectTargetConstraint -bump bump7 -instName IO2 -pinName pad -portNum 2
```

- In the example below, `fcroute` checks the bump LEF to detect the bump access directions and then connects the pads to the bump pre-routed wires based on the detected directions:

```
> setFlipChipMode -check_bump_access_directions true
> fcroute -type signal -designStyle pio
```

setProbePin

```
setProbePin
[-help]
{{-instName instName -pinName pinName}
 | -bump bumpName}}
```

Sets a pad or bump as a probe point. Probe points are used for package-level design and testing. To delete or report on probe points, use the `unsetProbePin` or `reportProbePins` commands respectively.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setProbePin` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setProbePin`
`-bump bumpName`	Specifies the instance name of the bump.
`-instName InstName`	Specifies the name of the I/O instance.
`-pinName pinName`	Specifies the name of the pin on the I/O instance that will be set as a probe point.

Example

- The following command sets pin `PAD` of I/O instance `Bump_1` as a probe point:

  ```
  setProbePin -instName Bump_1 -pinName PAD
  ```

Related Information

- `reportProbePins`
- `unsetProbePin`

setSpecialRouteType

```
setSpecialRouteType
[-help]
-stopTypeList swire_type_list
[-stopLayer Metal_layer]
-setType
{BLOCKRING|BLOCKAGEWIRE|BLOCKWIRE|COREWIRE|DRCFILL|FILLWIREOPC|FILLWIRE|FOLLOWPIN|IOWIRE|NOTYPE|PADRING|RING|STRIPE}
{-bumpCell bumpCellList | -instPin {{inst1 pin1} {inst2 pin2}...}}
```

Sets special routing wires to a particular shape type so that they can be written out into a DEF file using the `-specialShape` parameter of the `defOutBySection` command. This makes data filtering easier by enabling customized selection and output of special routing shape types. The output data is very specific and can be easily managed as storage size is small.

The `setSpecialRouteType` command works by tracing special wires and vias that touch bumps or instance pins through to a stop-layer or special wire stop type. All the traced special wires and vias are marked with a particular wire type. The `defOutBySection -specialShape` command is then used to write out the special type routes and vias.

Note: Use the `setSpecialRouteType` and `defOutBySection` commands in sequence. Save the design before you modify the shape types so that you can recover the original design with `defIn`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setSpecialRouteType` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setSpecialRouteType`
`-bumpCell` *`bumpCellList`*	Specifies the list of bump cells. If this option specified, the tracing starts from any special wires and vias that touch the named bump cells. **Note:** This option cannot be used with `-instPin`.
`-instPin` `{{`*`inst1 pin1`*`}` `{`*`inst2 pin2`*`}...}`	Specifies a list of pairs of instances and their pins. If this option specified, the tracing starts from any special wires and vias that touch the named instance pin pairs. **Note:** This option cannot be used with `-bumpCell`.
`-setType` `{BLOCKRING|BLOCKAGEWIRE|BLOCKWIRE|COREWIRE|DRCFILL|FILLWIREOPC|FILLWIRE|FOLLOWPIN|IOWIRE|NOTYPE|PADRING|RING|STRIPE}`	
	Sets the marked special wire to the specified wire type (DEF SPECIAL ROUTE SHAPE type). *Default*: `IOWIRE`
`-stopLayer` *`Metal_layer`*	Specifies the metal layer at which tracing should stop.
`-stopTypeList` *`swire_type_list`*	Specifies the special-wire types used in tracing. When a special wire with a shape type that is not included in the list is encountered, tracing stops. The legal list of *`swire_type_list`* are the DEF SPECIAL ROUTE SHAPE types: `BLOCKRING`, `BLOCKAGEWIRE`, `BLOCKWIRE`, `COREWIRE`, `DRCFILL`, `FILLWIREOPC`, `FILLWIRE`, `FOLLOWPIN`, `IOWIRE`, `NOTYPE`, `PADRING`, `RING`, `STRIPE`.

Example

- The following command traces special wires and vias that touch the named bump cells. Tracing stops when a special wire of type other than `IOWIRE` is encountered. The marked special wire is set to `IOWIRE`.

```
setSpecialRouteType -bumpCell {bc*} -stopTypeList {IOWIRE} -setType IOWIRE
```

spaceBondPad

```
spaceBondPad
[-help]
[-spread]
```

Spaces bond pads and the corresponding area I/O instances based on the constraints returned by the `getCellDist()` Tcl script.

The command distributes excess space until all the bond pads reach their maximum spacing constraint returned by the `getCellDist()` Tcl script or until the time when no extra space is left between the instances.

The initial distribution of space occurs for the clusters of instances that have the first or the last bond pads in the row. The remaining iterations equally distribute the remaining space between each I/O. The I/O instances that are in the end are placed at minimum spacing to the die edges, both on the left and right sides of the die.

The I/O pads will snap to I/O sites and the corresponding bond pads (bumps) will shift accordingly.

You can define the constraints in the `getCellDist()` Tcl script as follows:

```
proc getCellDist { xp yp xn yn padPosition padCount side ioRow staggerPos ioName }
```

Here:

- *xp yp* - Specifies the x and y coordinates of a previous bond pad having the same stagger position. If first, the location is 0, 0.
- *xn yn* - Specifies the x and y coordinates of the previous neighboring bond pad having any stagger position. If first, the location is 0, 0.
- *padPosition* - Specifies the position of the bond pad. The position can be i (inner), m (middle), or o (outer).
- *padCount* - Specifies the current bond pad count for bond pads at the same stagger position. For example, 1 for the first inner bond pad, 2 for the second inner bond pad, and so on.
- *side* - Specifies the n (North), s (South), e (East), or w (West) side of the bond pad.
- *ioRow* - Specifies the I/O row.
- *staggerPos* - Specifies the stagger type.
- *ioName* - Specifies the name of the I/O.

Note:

- The bond pad spacing for North and South is done from left to right.
- The bond pad spacing for East and West is done from bottom to top.
- The bond pad spacing for each side and ring is done independently.

After using the `spaceBondPad` command, you can use the `checkBondPadSpacing` command to check the bond pad spacing.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `spaceBondPad` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man spaceBondPad`
`-spread`	Removes any extra spacing that may exist between I/O cells, which were placed based on the rules defined in the `getCellDist()` Tcl script, and evenly distirbutes the extra space between all of the I/O cells in that row. You can use this parameter if there are large gaps (spaces) between I/O cells.

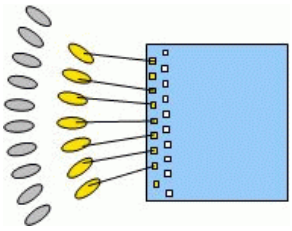
staggerBondPad

```
staggerBondPad
[-help]
{-startIoInstName instName [-endIoInstName instName] | -ring number |
-side {e | w | n | s} [-ring number] | -all}
{-pattern pattern_string | -startStaggerPosition {i | m | o}}
[-pad position padName position padName...]
[-pinName pinName]
```

Generates a staggered wirebond pad pattern on top of an existing I/O ring. In this design methodology, bond pads are separate LEF macro definitions from the I/O driver cells, but are placed on top of the I/O driver cells to form the combined bond pad and I/O driver circuitry.

The command only supports `CLASS PAD` instances.

To produce the staggered pattern, multiple bond pad cells are defined in the LEF for each I/O cell, each with its bond pad in a specific location corresponding to an outer, middle, or inner stagger position. The bond pads are defined such that when placed on the I/O cell, any one of them will connect to the I/O cell pin with no or minimal RDL routing.



Innovus generates a stagger pattern by selecting the outer, middle, or inner stagger bond pad to place on each I/O cell based on the location of that I/O instance in the I/O ring and the pattern that is being generated. If the order of the I/O cells is changed, or if cells are added or deleted, the stagger pattern may be regenerated. Because the bond pad macros are separately defined, they can be easily swapped with bond pads of different stagger positions without changing the logic of the design.

To define the relationship between the bond pads and I/O cells in the LEF file,
the following properties must be defined in each LEF file where they are referenced:

```
PROPERTYDEFINITIONS

     PIN bondPadOuter STRING;

     PIN bondPadMiddle STRING;

     PIN bondPadInner STRING;

     PIN ioCellOriginX REAL;

     PIN ioCellOriginY REAL;

     MACRO ioCellOffsetX REAL;

     MACRO ioCellOffsetY REAL;

 END PROPERTYDEFINITIONS
```

The LEF macros define the property values as follows:

```
MACRO IOCELL

     CLASS PAD ;

     ...

     SIZE 50.0 BY 225 ;

     ...

     PIN PAD
```

```
        PROPERTY bondPadOuter "BUMPA BUMPA1 BUMPD" ;
        PROPERTY bondPadMiddle "BUMPB" ;
        PROPERTY bondPadInner "BUMPC" ;
        PROPERTY ioCellOriginX 25.0 ;
        PROPERTY ioCellOriginY 0.0 ;
    END PAD
 END IOCELL

MACRO BUMPA
    CLASS COVER BUMP
    ...
    PROPERTY ioCellOffsetX -40 ;
    PROPERTY ioCellOffsetY -70 ;
 END BUMPA
```

Innovus automatically names the stagger bond pads as:

*IoCellInstName*_PAD*#*

Here:

- *IoCellInstName* - Specifies the instance name of the I/O cell on which the bond pad is being placed.
- *#* - Specifies the incremented bond pad number. The number `1` is used for all single pad I/O cells. This number is incremented when there are multiple bond pads on a single I/O cell.
  For example, if I/O cell `CKdiff` contained two pins, two bond pads would be placed on this cell and named as `CKdiff_PAD1` and `CKdiff_PAD2`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `staggerBondPad` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man staggerBondPad`
`-all`	Specifies that bond pads will be placed on all I/O instances.
`-endIoInstName` *instName*	Specifies the name of the last I/O instance of where bond pads will be placed. You can use this parameter in conjunction with the `-startIoInstName` parameter. **Note:** Bond pads are placed in a clock-wise pattern from the starting I/O instance (`-startIoInstName`) to the last I/O instance (`-endIoInstName`).
`-pad` *positionpadNamepositionpadName...*	Specifies which bond pad and position to use when multiple bond pads are specified in the LEF file for a given inner (i), middle (m), or outer (o) position. For example, If there are three outer bond pads specified in the LEF file, you can use this parameter to choose which bond pad to use as the outer bond pad. *Default*: The software uses the first bond pad in the list of bond pads for a given position.
`-pattern` *pattern_string*	Specifies the stagger pattern of the bond pads on the I/O instances. *pattern_string* specifies any combination of `i` (inner), `m` (middle), and `o` (outer).
`-pinName` *pinName*	Specifies the name of the pin inside the instance. If the instance specified by the `-startIoInstName` parameter contains multiple pins, you use this parameter to specify which pin to start with.
`-ring` *number*	Specifies which ring to operate on with ring 1 being the outer most ring. The ring number is incremented by one as you get closer to the core. For a three-ring design, the inner most ring is ring 3.
`-side {e | w | n | s}`	Specifies the geographical side of the die. You can specify the East (`e`), West (`w`), North (`n`), or South (`s`) side of the die.
`-startIoInstName` *instName*	Specifies the name of the first I/O instance of where bond pads will be placed. You can use this parameter in conjunction with the `-endIoInstName` parameter. If multiple pins exist in the instance, you can use the `-pinName` parameter to specify which pin to start with. **Note:** Bond pads are placed in a clock-wise pattern from the starting I/O instance (`-startIoInstName`) to the last I/O instance (`-endIoInstName`) if applicable.
`-startStaggerPosition {i | m | o}`	Specifies the starting stagger position of the specified bond pad (`-pad`) on the specified I/O instance (`-startIoInstName`). You can start the stagger position of the bond pad using the inner (`i`), middle (`m`), or outer (`o`) position. The default stagger position sequence is inner (`i`), middle (`m`), and outer (`o`). If you start with a stagger position of middle (`m`), the next bond pad is placed in an outer (`o`) stagger position followed by a bond pad placed in an inner (`i`) stagger position.

Example

- The following command places bond pads on all I/O instances using a stagger pattern of inner, outer, and middle and using bond pad `BUMPA1` at the outer position:

  ```
  staggerBondPad -all -pattern iom -pad o BUMPA1
  ```

- The following command places bond pads on the I/O instances of the outer most ring (East side) starting with a bond pad placed in the middle stagger position:

  ```
  staggerBondPad -side e -startStaggerPosition m -ring 1
  ```

- The following command places bond pads from I/O instance `abc` to I/O instance `xyz`, starting with pin `PAD` of I/O instance `abc` and using an inner, inner, outer stagger pattern:

  ```
  staggerBondPad -startIoInstName abc -endIoInstName xyz -pinName PAD -pattern iio
  ```

swapSignal

```
swapSignal
[-help]
[[-from {nameList} -to {nameList}] | -circle_offset value]
```

Swaps signal between selected instances (I/O pads or bumps).

To swap bump assignments in a circle, determine the value of offset you want to use. Assuming that the value of offset is `N`, the number of the selected bumps is `M`, the order of the input bump is `$index`, and the name of the bump with `$index` is `bump_$index`, you can swap bump assignments in a circle by using the the following command:

```
swapSignal -from {bump_1 bump_2 bump_3 ... bump_$index} -to {bump_[1+N] bump_[2+N] bump_[3+N]... bump_[$index+N-M]}
```

Parameters

`-help`	Prints a brief description of the `swapSignal` command. For a detailed description of the command, use the `man` command: `man swapSignal`
`-circle_offset value`	Specifies the offset value to swap bumps in circle. The value should be be positive and less than the number of the selected bumps. For example, if you select the bumps bump1, bump2, bump3, bump4 and bump5 in the GUI and specify `-circle_offset` as 2, the result of signal swapping will be as follows: bump1(S1) bump2(S2) bump3(S3) bump4(S4) bump5 (S5) -> bump1(S4) bump2(S5) bump3(S1) bump4(S2) bump5 (S3)
`-from nameList`	Specifies the names of bumps from which signal is to be swapped.
`-to nameList`	Specifies the names of bumps to which signal is to be swapped.

Examples

- The bumps `Bump_74_3_7` and `Bump_23_2_2` are selected. The following command swaps the signal between them:
  `swapSignal`
- The bumps `Bump_100_9_9`, `Bump_90_9_8`, `Bump_80_9_7`, and `Bump_70_9_6` are selected. The following command swaps the bump assignments between them in a circle with an offset value of `1`:
  `swapSignal -circle_offset 1`

unassignBump

```
unassignBump
[-help]
{-allBumps | -byBumpName {list} | -byBumpSite {list} | -selected}
```

Removes the Verilog signal names from bumps, which removes the connection between bumps and I/O pins. The original connection will remain in the Verilog and is connected when the bump is reassigned. If the bump is assigned, it will appear in the DEF `SPECIALNETS` section with the signal (net) name. Use this command after bumps are assigned with the `assignBump` command or defined in the I/O file with the signal name, but without the `-fixed` constraint.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `unassignBump` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man unassignBump`
`-allBumps`	Removes all the connections between bumps and I/O pins and removes the signal assignment of the bumps.
`-byBumpName list`	Removes only the connections between bumps and I/O pins contained in the bump name list.
`-byBumpSite list`	Removes only the connections between bumps and I/O pins contained in the site list.
`-selected`	Specifies to unassign the bump(s) selected in the design in the GUI.

Examples

- The following command unassigns all of the bumps:
  ```
  unassignBump -allBumps
  ```
- The following command unassigns the (named) bumps `bumpA` and `bumpB`:
  ```
  unassignBump -byBumpName {bumpA bumpB}
  ```

unfixBondPad

```
unfixBondPad
[-help]
{-ioInstName InstName [-pinName pinName] | -selected}
```

Unassigns the fixed status of a specified bond pad.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `unfixBondPad` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man unfixBondPad`
`-ioInstName` *instName*	Specifies the name of the I/O instance whose bond pad's fixed status will be unassigned.
`-pinName` *pinName*	Specifies the name of the pin.
`-selected`	Unassigns the fixed status of a selected bond pad. You must first select the bond pad in the design display area, then use this parameter to unassign the fixed status.

Example

- The following command unassigns the fixed status of the bond pad on I/O instance `pad_addr[30]`:

  ```
  unfixBondPad -ioInstName {pad_addr[30]}
  ```

Related Information

- `staggerBondPad`

unfixBump

```
unfixBump
[-help]
{-allBumps | -byBumpName {list}}
```

Removes the bump assignment status from a specified list of assigned bumps that were set with the `setBumpFixed` command. The software updates the DEF file by removing the `+FIXEDBUMP` attribute from the specified group of assigned bumps to indicate that they are now in an unfixed state.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `unfixBump` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man unfixBump`
`-allBumps`	Removes the bump assignment status from all bumps.
`-byBumpName {list}`	Removes the bump assignment status from a specified list of assigned bumps.

Examples

- The following command removes the bump assignment status from all bumps:
  ```
  unfixBump -allBumps
  ```
- The following command removes the bump assignment status from bumps `bumpA` and `bumpB`:
  ```
  unfixBump -byBumpName {bumpA bumpB}
  ```

unsetProbePin

```
unsetProbePin
[-help]
{-instName InstName -pinName pinName}
| -bump bumpName
```

Unsets a pad or bump as a probe point. Probe points are used for package-level design and testing. To set or report on probe points, use the `setProbePin` or `reportProbePins` commands respectively.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `unsetProbePin` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man unsetProbePin`
`-bump bumpName`	Specifies the instance name of the bump.
`-instName InstName`	Specifies the name of the I/O instance.
`-pinName pinName`	Specifies the name of the pin on the I/O instance that will be unset as a probe point.

Example

- The following command unsets the `PAD` pin of `Bump_1` as a probe point:

  ```
  unsetProbePin -instName Bump_1 -pinName PAD
  ```

Related Information

- `reportProbePins`
- `setProbePin`

verifyFlipChipRoutingConstraints

```
verifyFlipChipRoutingConstraints
[-help]
[-routeStyle {manhattan | 45DegreeRoute}]
```

Reports the status of bump placement and routing contsraints. Use this command to check whether the flip chip routing result meets the settings in the constraints file.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `verifyFlipChipRoutingConstraints` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man verifyFlipChipRoutingConstraints`.
`-routeStyle {manhattan | 45DegreeRoute}`	Specifies the route style to check, which could be `manhattan` or `45DegreeRoute`.

Example

- The following command checks for flip chip routing violations of the Manhattan route style:
  ```
  verifyFlipChipRoutingConstraints -routeStyle manhattan
  ```

Related Information

- `fcroute`
- `getFlipChipMode`
- `setFlipChipMode`

viewBumpConnection

```
viewBumpConnection
[-help]
[-honor_color]
[-multiBumpsToPad]
[-multiPadsToBump]
[-remove]
[[[-net net_list] [-bump bump_list] [-io_inst io_inst_list] [-selected]]|[[-bumpType {all | power | signal}] [-target
{pad | ring}]]]
```

Displays the connection as a flightline between a power/ground (PG) bump and a PG I/O pad, during signal bump assignment. You can remove the flightlines between the bumps and I/O pads by using `viewBumpConnection -remove`.

For both signal and power pins, `viewBumpConnection`, by default, displays a long pin connection with the correct location, instead of the center of the pin.

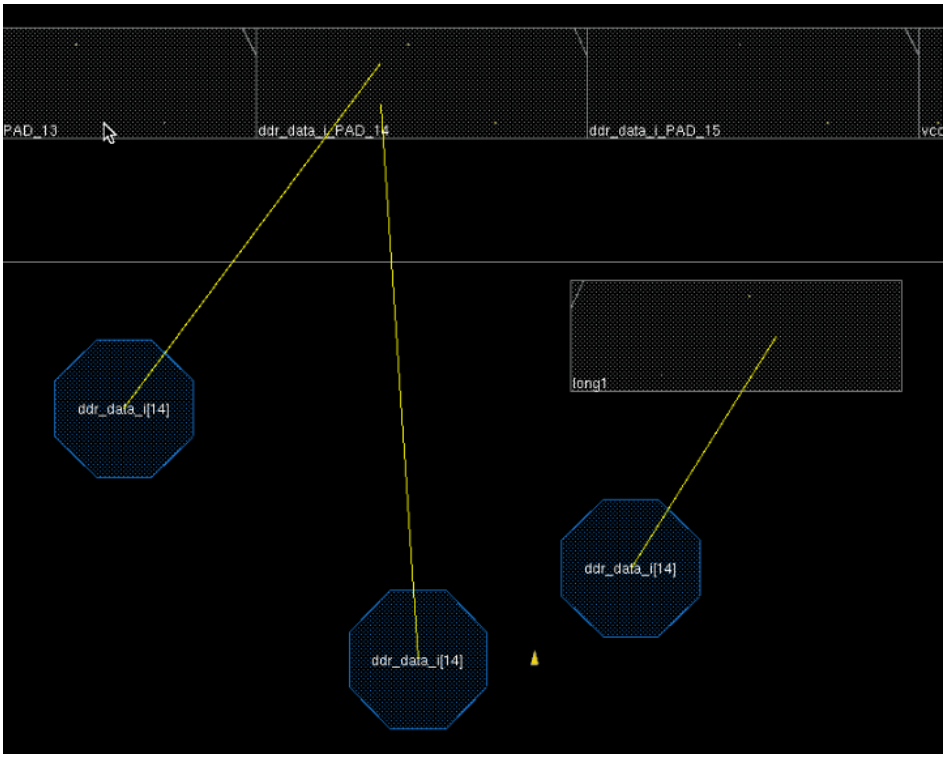
Note: `viewBumpConnection` honors the port tag information in bumps for both signal and power flightline for multiple pad and multiple bump routing.

Parameters

`-help`	Prints a brief description that includes type and default information for each `viewBumpConnection` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man viewBumpConnection`
`-bump` *`bump_list`*	Specifies bumps for which flightlines are to be displayed.
`-bumpType {all | power | signal}`	
	Specifies the connecting bump type, which could be: • `all` - All the bump types • `power` - Power bump • `signal` - Signal bump *Default:* `all`
`-honor_color`	Colors flightlines according to the settings defined with the `ciopLoadBumpColorMapFile` command.
`-io_inst {`*`io_inst_list`*`}`	
	Specifies IO instances or blocks for which flightlines are to be displayed. Specified IO instances should be CLASS PAD AREAIO instances. Specified blocks should have at least one pin port in CLASS BLOCK cell containing the CLASS BUMP property.
`-multiBumpsToPad`	
	Displays connections from multiple bumps to one pad. Note: If neither `-multiBumpsToPad` or `-multiPadsToBump` is specified, the `viewBumpConnection` command will display only one-to-one connections.
`-multiPadsToBump`	
	Displays connections multiple pads to one bump. Note: If neither `-multiBumpsToPad` or `-multiPadsToBump` is specified, the `viewBumpConnection` command will display only one-to-one connections.
`-net` *`net_list`*	Specifies nets for which flightlines are to be displayed.
`-remove`	Removes the bump connections.
`-selected`	Displays flightlines for selected bumps and IO instances in bold.
`-target {pad | ring}`	
	Specifies the connecting target, which could be a `pad` or a `ring`.

Examples

- The following command displays flightlines for bumps `Bump_1` and `Bump_2`:
  ```
  viewBumpConnection -bumps {Bump_1 Bump_2}
  ```
- The following command displays connections from multiple bumps to one pad:
  ```
  viewBumpConnection -multiBumpsToPad
  ```



- The following command displays connections from multiple bumps to one pad:
  `viewBumpConnection -multiPadsToBump`

writeFlipChipProperty

```
writeFlipChipProperty
[-help]
fileName
```

Saves the bump and pad properties in the bump and IO pad property file. The property file is a manually editable text file.

Parameters

`-help`	Prints out the command usage that includes type and default information for each `writeFlipChipProperty` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man writeFlipChipProperty`
`fileName`	Specifies the bump and pad property file name.

Example

The following command saves the bump and pad properties in a file named `test2`:

```
writeFlipChipProperty test2
```

Flip Chip Global Variables

- flipchip_allow_routed_bump_edit

flipchip_allow_routed_bump_edit

```
flipchip_allow_routed_bump_edit {0 | 1}
```

Type: Integer

Default: `1`

Specifies whether the tool should check routing status of bumps before allowing manipulation. By default, the tool ignores routing status and allows manipulation of routed bumps. Manipulation actions include moving, deleting, re-assigning, and swapping. Set this variable to `0` if you want the tool to check routing status of bumps and disallow manipulation of routed bumps.

The `flipchip_allow_routed_bump_edit` variable directly affects `dbSetFPlanBox`. If this variable is set to `1`, a routed bump can be set to a new box (moving action is implemented by changing the object's box). All commands that call `dbSetFPlanBox` internally are also affected by this variable.

add_ndr

```
add_ndr
[-help]
[-add_via {via_name1 via_name2 ...}]
[-exclude_backside_via]
[-generate_via]
[-hard_spacing]
[-init string]
[-min_cut {layer1[:layer2] min_cut ...}]
[-spacing string | -spacing_multiplier string]
[-via {via_name1 via_name2 ...}]
[-width string | -width_multiplier string]
{-name ruleName}
[-use_via_cut_class string]
```

Adds a non-default rule for objects. You can also remove vias from the NDR. The command checks the `generateVias` mode and if `setGenerateViaMode` is set to `-auto true`, the generated vias is used irrespective of the `-generate_via` option. You can use the command at any point in the design flow.

Parameters

`-help`	Prints a brief description that includes type and default information for each `add_ndr` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_ndr`
`-add_via {`*`via_name1 via_name2 ...`*`}`	
	Adds vias to the existing via list. You can use this parameter to add DFM vias or other custom vias.
`-exclude_backside_via`	Prevents inclusion of non-route or backside vias in a newly defined non-default rule.
`-generate_via`	
	Auto-generates vias with the generateVia command. **Note:** If the NDR specified by you is with metal wider than the default rule, it is recommended to use this option for getting better routing results.
`-hard_spacing`	Sets the non-default rule as HARDSPACING.
`-init` *`string`*	Specifies the name of an existing non-default rule from which all values are initialized. **Note:** Other options will over-write these values.
`-min_cut {layer1[:layer2]` *`min_cut ...`*`}`	
	Specifies the minimum cut limit for via layers.
`-name` *`ruleName`*	Specifies the name of the non-default rule that is to be added.
`-spacing {layer1[:layer2]` *`spacing ...`*`}`	
	Specifies the spacing for routing layers.
`-spacing_multiplier {layer1[:layer2]` *`spacing_multiplier`*`}`	
	Spacing multiplier for routing layers.
`-use_via_cut_class` *`string`*	

	Specifies multiple layer definition and `cut_class` list to support the LEF/DEF property. The value must be given in the format of either `{layer cut_class}` or `{layer cut_class nr_row nr_col}`. Refer to the examples below:
	`add_ndr -name new_1 -use_via_cut_class {V1 VX}`
	`add_ndr -name new_2 -use_via_cut_class {V1 VX 2 1}`
	`add_ndr -use_via_cut_class {{V1 VX 2 1} {V2 VH 2 1} .....}`

`-via {`*`via_name1 via_name2 ...`*`}`	
	Resets and adds the list of via or via rule generate name.
`-width {layer1[:layer2]` *`width ...`*`}`	
	Specifies the width for routing layers.
`-width_multiplier {layer1[:layer2]` *`width_multiplier ...`*`}`	
	Width multiplier for routing layers.

Examples

- The following command creates a rule that requires extra spacing. All other values are the same as the default rule.
  ```
  add_ndr -name default_2x_space -spacing {metal1:metal4 0.2 metal5:metal6 0.4 metal7 0.6}
  ```
- The following command creates a new wide-wire routing rule (double wide on the Mx routing layers, but not the wide layers). Auto-generate vias because the width changed, so the default vias are not correct.
  ```
  add_ndr -name Mx_2x_wide -width {metal1:metal4 0.20} -generate_via
  ```
- The following command uses existing wide-wire rule, but require 2 cut vias for the Vx layers (via1 to via3)
  ```
  add_ndr -name Mx_2x_wide_Vx_2cut -init Mx_2x_wide -min_cut {via1:via3 2}
  ```

Related Information

- modify_ndr

add_shape

```
add_shape
[-help]
-layer {layerNameOrPointer}
[-net {netName}]
[-shape {None RING STRIPE FOLLOWPIN IOWIRE COREWIRE BLOCKWIRE FILLWIRE BLOCKAGEWIRE PADRING BLOCKRING DRCFILL FILLWIREOPC}]
[-shield_net {netNameOrPointer}]
[-status {ROUTED FIXED COVER SHIELD NOSHIELD}]
[-user_class className]
{-rect {x1 y1 x2 y2} | -patch {x1 y1 x2 y2} | -polygon {x1 y1 x2 y2 ...xn yn} |
[-pathSeg {x1 y1 x2 y2} -width value [-beginExt value -endExt value]]}
```

The command `add_shape` adds `DEF SPECIALNETS` wiring shapes to the database. You can use the command at any point in the design flow.

Parameters

`-help`	Prints a brief description that includes type and default information for each `add_shape` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_shape`
`-beginExt` *value*	Specify the extension beginning value in microns. *Default*: The default extension for a pathSeq is 0.
`-endExt` *value*	Specify the extension beginning value in microns. *Default*: The default extension for a pathSeq is 0.
`-layer {`*layerNameOrPointer*`}`	
	Name of the layer or layer pointer.
`-net` *netName*	Name of the net.
`-pathSeg {`*x1 y1 x2 y2*`}`	
	The beginning and ending coordinates for the path segment.
`-patch {`*x1 y1 x2 y2*`}`	
	Specifies the coordinates of the lower-left and upper-right points of the rectangle for creating the patch wires.
`-polygon {`*x1 y1 x2 y2 ...xn yn*`}`	
	The point list of the polygon.
`-rect {`*x1 y1 x2 y2*`}`	
	Specifies the coordinates of the lower-left and upper-right points of the rectangle for creating the horizontal and vertical wires.
`-shape {None RING STRIPE FOLLOWPIN IOWIRE COREWIRE BLOCKWIRE FILLWIRE BLOCKAGEWIRE PADRING BLOCKRING DRCFILL FILLWIREOPC}`	
	Defines the `SPECIALNETS` wiring shape. *Default*: `None`
`-shield_net {`*netNameOrPointer*`}`	
	The name or pointer of the net to be shielded by the via instance. The `-shield_net` parameter is only allowed when `-status` SHIELD is used.
`-status {ROUTED FIXED COVER SHIELD NOSHIELD}`	
	Defines the `SPECIALNETS` wiring status. *Default*: `ROUTED`.
`-width` *value*	The width in microns.
`-user_class`	Defines the attribute class by user.

Example

- `-pathSeg`: The command would add a `pathSeg` to the net with the name `VSS` on layer `METAL1` at the co-ordinates (100, 100, 250 ,250) with a width of 2.5 microns and the begin and end extensions of 1.25 microns.
  Note: Typically, the begin and end extension values are zero for most `DEF SPECIALNETS` wiring, but can be any value that would result in the end of the wire falling on the manufacturing grid.
  ```
  add_shape -net VSS -layer METAL1 -pathSeg {100 100 250 250} -width 2.5 -beginExt 1.25 -endExt 1.25
  ```
- `-polygon`: The command would add a polygon shaped wire to the net with the name `VSS` on layer `METAL1` as a polygon with coordinates specified.

```
add_shape -net VSS -layer METAL1 -polygon {{25.05 25.115} {25.115 25.05} {25.115 24.95} {5.05 4.885} {4.95 4.885} {4.885 4.95} {4.885 5.05} {24.95 25.115}}
```

- This command would add a polygon shape swire to snet `VSS` on layer `METAL3` having coordinates similar to the swire belonging to the net `VSS` on layer `METAL1`.

```
add_shape -polygon [dbGet [dbGet [dbGet top.nets.name VSS -p ].swires.layer.name M1 -p2 ].polyPts -i 0] -net VSS -layer METAL3
```

-pt {x y}
```

Adds text to the specified custom layer. You can use the `add_text` command at any point in the design flow. The text added by the command is to annotate comment text and does not show up in a `DEF` output.

Parameters

`-help`	Prints a brief description that includes type and default information for each `add_text` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_text`
`-alignment {centerCenter centerLeft centerRight lowerCenter lowerLeft lowerRight upperCenter upperLeft upperRight}`	
	Specifies the alignment of the text.
`-drafting {true | false}`	
	Indicates if the text is always displayed.
`-font {euroStyle gothic math roman script stick fixed swedish milSpec}`	
	Specifies the font style of the text. *Default*: `stick`
`-height value`	Specifies the height of the text, in microns.
`-label {string}`	
	Specifies the text string.
`-layer {layerNameOrPointer}`	
	Specifies the layer name or the layer pointer.
`-oaPurpose {string}`	
	Specifies a user-defined purpose name for OpenAccess text layer purpose pair support. Only values that exist in the library's tech graph are allowed. If the specified name is not a legal purpose name, a warning is displayed and the text is treated as drawing purpose. *Default:* `drawing`
`-orient {MX MX90 MY90 R0 R180 R270 R90}`	
	Specifies the orientation of the text.
`-pt {x y}`	
	Specifies the beginning coordinates of the text. It is specified in microns.

addAIoFiller

```
addAIoFiller
[-help]
{-cell fillerCellName | -cellList {fillerCellName1 fillerCellName2 ...}}
[-prefix prefix]
[-aioRowCluster aioRowClusterName | -allAIORowCluster]
[-setPreplaced]
[-onlyESD]
[-onlyShoulder]
[-onlyGap]
[-powerDomain powerDomainName]
```

Adds area I/O filler cell instances. Use this command during or after floorplanning. You can also use the command after the placement of manually created area I/Os.

The command,

- By default, adds area I/O filler cells to all the area I/O clusters if you do not specify the `-aioRowCluster` and `-allAIORowCluster` parameters.
- Adds filler cells in all the blank sites of the specified area I/O row clusters if you do not specify the `-onlyESD`, `-onlyGap` and `-onlyShoulder` parameters.
- Uses any LEF `CLASS PAD` or `CLASS PAD AREAIO` for adding the area I/O filler cells. By default the command uses LEF `CLASS PAD SPACER` to add filler cells, and also adds filler cells using any LEF `CLASS PAD` displaying a warning in Innovus.
- Does not allow overlapping of filler cells and places non-overlapping filler cells.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `addAIoFiller` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man addAIoFiller`
`-aioRowCluster` *aioRowClusterName*	
	Specifies the area I/O row cluster name. AIO filler cells are added only to this cluster. *Data_type*: string, optional
`-allAIORowCluster`	Adds AIOFiller cells to all the area I/O clusters. *Data_type*: bool, optional
`-cell` *fillerCellName*	Specifies the name of the area I/O filler cell to be added. *Data_type*: string, optional
`-cellList {`*fillerCellName1 fillerCellName2 ...*`}`	
	Specifies the list of area I/O filler cells that fill the gaps in I/O row clusters. Adds the largest filler cell first, followed by smaller filler cells. *Data_type*: string, optional
`-onlyESD`	Specifies to add ESD (electrostatic discharge) cells with the filler cell name in the area I/O row clusters. *Data_type*: bool, optional
`-onlyGap`	Specifies to add the filler cells with the filler cell name to fill all the gaps in the area I/O row clusters. *Data_type*: bool, optional
`-onlyShoulder`	Specifies to add shoulder cells with the filler cell name in the area I/O row clusters. *Data_type*: bool, optional
`-powerDomain` *powerDomainName*	
	Specifies the name of the power domain in which the area I/O filler cells are to be added. *Data_type*: string, optional
`-prefix` *prefix*	Specifies the prefix name to be appended for the added area I/O filler cell instance. *Data_type*: string, optional
`-setPreplaced`	Sets the status of the area I/O filler cells as preplaced. *Data_type*: bool, optional

Example

- The following command fills all area I/O row clusters on `ESD`, `shoulder`, and `gap` sites with a filler cell `A0_123` with preplaced status:
  ```
  addAIoFiller -cell AO_123 -setPreplaced
  ```
- The following command adds area I/O filler cells,`IOFILL` and `IOFILL_HALF`,to fill all the gaps in all area I/O row clusters:
  ```
  addAIoFiller -allAIORowCluster -onlyGap -cellList { IOFILL IOFILL_HALF }
  ```

addAIORow

```
addAIORow
[-help]
-site site_name
{-bump bumpId | -loc llx lly}
[-dx x_dist] [-dy y_dist]
[-orient {R0|R90|R180|R270|MX|MX90|MY|MY90}]
[-H | -V]
[-esd esites_no...]
[-shoulder site_no...]
[-cluster_halo space]
[-num num]
[-abutRow]
[-rowName name]
[-noSnap]
[-soft]
[{-ptnArrX elem1 | -ptnArrY elem2} {-pitchX dist | -pitchY dist}]
```

Adds area I/O rows. Use this command during or after floorplanning.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `addAIORow` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man addAIORow`
`-abutRow`	When creating two I/O rows that abut each other, this option specifies that one of them will be in a flip orientation to the other. *Data_type*: bool, optional
`-bump bumpId`	Specifies the bump ID that is used to specify the start point of the row area. The `-bump` parameter creates IO rows from the center point of the specified bump. For example, when you specify -bump 17_1_1, the row will be created from the center point of this bump. The length of row is controlled by other options. *Data_type*: string, required
`-cluster_halo space`	
	Specifies the distance, in microns, around the boundary of a row cluster to prevent other cells from being placed near it. *Data_type*: float, optional
`-dx x_dist`	Offsets the reference point, in microns, to the first I/O row on the `x` axis. *Data_type*: float, optional
`-dy y_dist`	Offsets the reference point, in microns, to the first I/O row on the `y` axis. *Data_type*: float, optional
`-esd esites_no...`	Reserves the sites in the row as electrostatic discharge cells (ESD). For example: `-esd 2,7` **Notes:** • Use only when you create cluster rows with multiple sites. • Do not use the `-soft` option with this option. *Data_type*: string, optional
`-H | -V`	Specifies the either a **H**orizontal or a **V**ertical row. *Data_type*: bool, optional
`-loc llx lly`	Specifies the lower left `x` and `y` coordinate reference points, in microns, of the new I/O row. *Data_type*: point, required

`-noSnap`	Adds the area IO row at the exact location specified by the `addAIORow -loc` coordinates rather than snapping the row to the standard cell placement grid. *Data_type*: bool, optional
`-num` *num*	Specifies the number of sites. *Data_type*: int, optional
`-orient {R0|R90|R180|R270|MX|MX90|MY|MY90}`	
	Specifies the orientation for the row. See *Orientation Key* below for more information. *Default*: R0 *Data_type*: enum, optional
`-ptnArrX` *elem1*	Specifies the x dimensions of the row cluster array size. For example, to create a 5 x 8 row array, `-ptnArrX 5 -ptnArrY 8` *Data_type*: int, optional
`-ptnArrY` *elem2*	Specifies the y dimensions of the row cluster array size. For example, to create a 4 x 6 row array, `-ptnArrX 4 -ptnArrY 6` *Data_type*: int, optional
`-pitchX` *dist*	Specifies the distance between bump centers, in microns, in the `x` direction. *Data_type*: float, optional
`-pitchY` *dist*	Specifies the distance between bump centers, in microns, in the `y` direction. *Data_type*: float, optional
`-rowName` *name*	Specifies a user-defined instance name for an added IO Row or a prefix for multiple rows, as in a matrix. If only one row is added, the name is used exactly as specified. If multiple rows are added, a number prefix is appended to the name. *Data_type*: string, optional
`-site` *siteName*	Specifies the site name for the area I/O row. *Data_type*: string, required
`-shoulder` *site_no...*	Reserves the sites in a row as shoulder cells. For example: `-shoulder 1,10` **Notes:** • Use only when you create cluster rows with multiple sites. • Do not use `-soft` option with this option. *Data_type*: string, optional
`-soft`	Creates a reef or cluster that can be collapsed if no I/O cells are placed in the available spaces within the reef or cluster. Use this parameter if the cluster site is not fully placed so that standard cells can be placed in these spaces if I/O cells are not placed there. **Note:** Do not use the `-esd` or `-shoulder` options with this option. *Data_type*: bool, optional

Orientation Key

The following table is a key to row orientation:

Value	Definition
`R0`	No rotation
`MX`	Mirror through X axis

`MY`	Mirror through Y axis
`R180`	Rotate counter-clockwise 180 degrees
`MX90`	Mirror through X axis and rotate counter-clockwise 90 degrees
`R90`	Rotate counter-clockwise 90 degrees
`R270`	Rotate counter-clockwise 270 degrees
`MY90`	Mirror through Y axis and rotate counter-clockwise 90 degrees

Examples

- The following command creates an I/O row with site name `IO1` at the location related to the center of the bump selected in the design window. There is a 5 x 7 row array and each element in the array is separated by `100` µm in both the `x` and `y` axes. Each row has `8` sites.
  ```
  addAIORow -site IO1 -bump 0x33457a -H -num 8 -ptnArrX 5 -ptnArrY 7 -pitchX 100 -pitchY 100
  ```
- The following command creates a soft I/O row cluster with a `15.0` micron halo around it:
  ```
  addAIORow -site IO3 -loc 0.0 0.0 -dx 230 -dy 58.8 -num 7 -orient R0 -V -soft -abutRow -cluster_halo 15.0
  ```
- The following command creates an IO Row with a user-defined name:
  ```
  addAIORow -site IO1 -rowName newrow -loc 0 0 -dx 0 -orient R0 -V -num 1
  ```

addDummyBoundaryWires

```
addDummyBoundaryWires
[-help]
-layers layerName | { layerNameList ... }
[-masks maskNumber | { maskNumberList ... }]
[-shape {blockring | blockagewire | blockwire | corewire | drcfill| fillwireopc | fillwire | followpin | iowire | none | padring | ring |
stripe} ]
[-shortWires wireLength | { wireLengthList ... }]
[-space spaceValue | { spaceValueList ... }]
```

Add wires on the first and last tracks in the direction parallel to preferred routing direction with specified layers.

Note: DRC rules define forbidden regions near the design boundary edges that are parallel to the preferred routing direction of a layer. Any wires in these regions cannot project to the design boundary directly. Using the `addDummyBoundaryWires` command you can add wires that shadow the design boundary such that no routing wires in the forbidden regions can project to the design boundary. This helps to avoid DRC violations.

Note: The `addDummyBoundaryWires` command enables long dummy wires to honor route blockages by default.

Note: The `addDummyBoundaryWire` command honors routing blockages and adds dummy wires along the routing blockages when the track box overlaps with them. The dummy wires do not cross partial routing blockages around the design boundary. It keeps the wires at the boundary and discontinues them when there is a routing blockage.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `addDummyBoundaryWires` parameter. For a detailed description of the command and all of its parameters, use the man command: `man addDummyBoundaryWires`
`-layers layerName | { layerNameList ... }`	

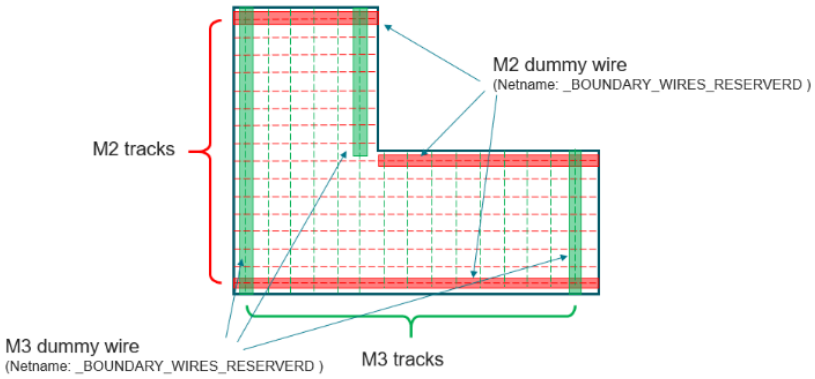
	Specifies the layers on which the dummy boundary wires are added.
	Note: The net name of the dummy wires is "`_BOUNDARY_WIRES_RESERVED`".
	Note: You can specify the *layerName* as a number, abbreviation or as a layer name defined in LEF. For example, *layerName* can be specified as 2, M2 or Metal2.
	`addDummyBoundaryWires -layers {metal2 metal3} //full name works`
	`addDummyBoundaryWires -layers {M2 M3} //abbreviated name works`
	`addDummyBoundaryWires -layers {2 3} ///layer number works`
	Data_type: string, required

`-masks maskNumber | { maskNumberList ... }`	Specifies one or multiple mask numbers which short dummy boundary wires snap to. The number of specified mask values should match the number of the specified layers in option layers. *Data_type*: string, optional
`-shape {blockring | blockagewire | blockwire | corewire | drcfill| fillwireopc | fillwire | followpin | iowire | none | padring | ring | stripe}`	
	Specifies the shape of the dummy boundary wires. *Default:* `none` *Data_type*: string, optional
`-shortWires wireLength | { wireLengthList ... }`	Specifies one or multiple set of lengths of short dummy boundary wires and space between them. The number of specified shortWires values should be twice of the number of specified layers in option layers. *Data_type*: string, optional
`-space spaceValue | { spaceValueList ... }`	Specifies one or multiple space values to design boundary. **Note**: The space value is the distance between the design boundary and the start or end of the wire for 90 corner. The space value does not apply to 270 corner. *Default:* `0` *Data_type*: string, optional

Examples

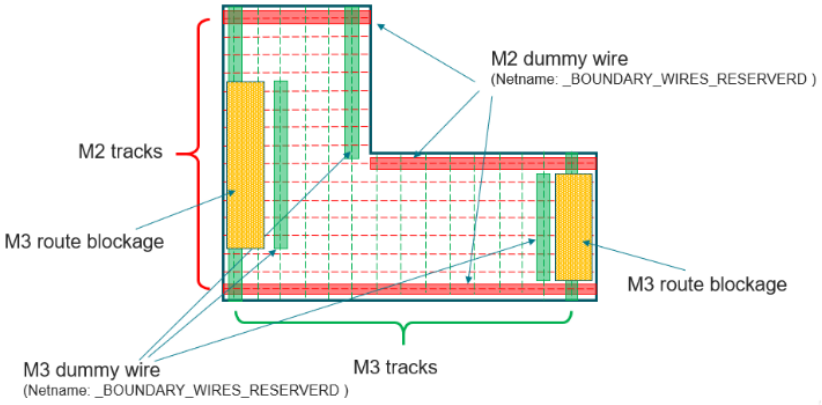
- The following command adds dummy wires on layers metal2 and metal3:

```
addDummyBoundaryWires -layers {M2 M3}
```



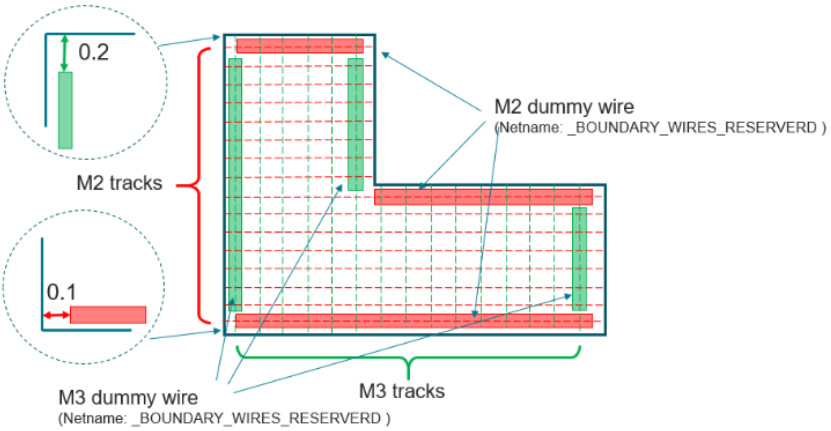
- The following command adds dummy wires on layers metal2 and metal3. Dummy wires will honor route blockages by default on Metal3 :

```
addDummyBoundaryWires -layers {M2 M3}
```



- The following command adds dummy wires with space value on layers metal2 and metal3:

```
addDummyBoundaryWires -layers {M2 M3} -space {0.1 0.2}
```



- The following command adds long dummy wires with specified space and short dummy wires with specified length, space and mask on layers metal2:

```
addDummyBoundaryWires -layers M2 -space 0.1 -shortWires {0.15 0.2} -masks 1
```

addHaloToBlock

```
addHaloToBlock
[-help]
left bottom right top
[-fromInstBox]
[-snapToSite]
[-ori orientation]
[inst_name |-allMacro | -allBlackBox | -allCommitPtn | -allBlock | -allIOPad | -cell name]
```

Adds a halo to a block. A halo is an area that prevents the placement of blocks and standard cells within the specified halo distance from the edges of a hard macro, black box, or committed partition in order to reduce congestion. A block halo value is specified based on the current block orientation. Use this command during or after floorplanning. You can use the `deleteHaloFromBlock` command to delete halos.

Parameters

`-allBlackBox`	Specifies halo values for all black boxes. *Data_type*: bool, optional
`-allBlock`	Specifies halo values for all hard macros, black boxes, and committed partitions. *Data_type*: bool, optional
`-allCommitPtn`	Specifies halo values for all committed partitions. *Data_type*: bool, optional
`-allIOPad`	Specifies halo values for all IO pads. *Data_type*: bool, optional
`-allMacro`	Specifies halo values for all hard macros. *Data_type*: bool, optional
`-cell` *name*	Specifies halo values for all instances of a cell. *Data_type*: string, optional
`-fromInstBox`	Creates a block halo, based on the instance boundary, even when there is an overlap layer defined in the block cell or macro definition. **Note:** This parameter is for backward compatibility only. Cadence does not recommend the use of this parameter because there can be problems with the defin flow if this parameter is specified and if the block cell or the macro has overlap layers. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `addHaloToBlock` parameter. For a detailed description of the command and all of its parameters, use the man command: `man addHaloToBlock`
inst_name	Specifies the block where the halo is to be added. You can use wildcards (* or ?) for specifying instance names. *Data_type*: string, optional
left bottom right top	
	Specifies the halo width on 4 sides. These values are floats, units are microns. Halo deltas are specified in relation to a block in R0 orientation (`left` is applied to the left edge of block oriented R0). For non-R0, the halo deltas are rotated/flipped according to the blocks's orientation (for block oriented MY, the `left` halo delta specifies the width of the halo along the *right* side of the inst in the floorplan). • `left`: the width of the halo along the left edge of insts having halos added. • `bottom`: the width of the halo along the bottom edge of objects having halos added. • `right`: the width of the halo along the right edge of objects having halos added. • `top`: the width of the halo along the top edge of objects having halos added. *Data_type*: box, required
`-ori` *orientation*	
	Specifies the orientation value of the instances to which the block halo values are applied. The orientation value can be R0, R90, R180, R270, MX, MX90, MY, or MY90. **Note**: If the orientation is not set, the halo will be added with the current orientation of the macro. *Data_type*: string, optional
`-snapToSite`	Snaps the halo box to a site. *Data_type*: bool, optional

Example

The following command adds a halo around block `xy_inst`:

```
addHaloToBlock 10 20 30 40 xy_inst
```

If `xy_inst` is R0, the halo width is 10 along the left edge and 30 along the right edge. If the block is MY, the halo width is 30 along the *left* edge in the floorplan, and 10 along the *right* edge in the floorplan.

The following command adds a halo around all insts with cells of type `myDRAMCell`:

```
addHaloToBlock 10 20 30 40 -cell myDRAMCell -ori MY
```

If the inst is oriented R0, then the *left* edge width of the halo is 30 in the floorplan, and the *right* edge width of the halo is 10.

  - Edit Halo

addInstToInstGroup

```
addInstToInstGroup
[-help]
group_name
object_name
```

Adds a hierarchical instance, an instance or list of instances, or a group to a specified group. A group is a user-defined pseudo hierarchy and is created to contain instances and/or other groups. Use this command after creating a group name.

Notes:

- When you add a member to a group whose constraint is a fence or a region, the size of the bounding box of the group does not change.
- If the group being added is also a power domain, a warning is displayed and the command is not executed.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `addInstToInstGroup` parameter. For a detailed description of the command and all of its parameters, use the man command: `man addInstToInstGroup`
group_name	Specifies the name of the created group. *Data_type*: string, required
object_name	Specifies the name of the object, another group, hierarchical instance or leaf instance. **Note:** You can specify an instance names list in the { *inst_name_list* } format. The names list option is used for instances only and NOT for group or hierarchical instances. *Data_type*: string, required

Examples

- The following command adds hierarchical instance to group adder1:
  ```
  addInstToInstGroup adder1 SH28/I12/I44
  ```
- The following command adds group subadder to group adder1:
  ```
  addInstToInstGroup adder1 subadder
  ```
- The following command adds the instances inst_I1, inst_I2, and inst_I3 to group inst_group:
  ```
  addInstToInstGroup inst_group {inst_I1 inst_I2 inst_I3}
  ```

Related Information

addIoFiller

```
addIoFiller
[-help]
-cell {name_list}
[-fillAnyGap]
[-fillerOrient R0 | R90 | R180 | R270 | MX | MX90 | MY | MY90]
[-from coord]
[-prefix prefix]
[-side {top | bottom | left | right}]
[-to coord]
[-row rowNumber]
[-useSmallIoHeight]
[-logic [-deriveConnectivity]]
```

Adds I/O instances in the I/O box. The I/O instances are added between the gap of existing I/O pad instances where the gap is large enough for the I/O instance. Use this command during or after floorplanning.

Note: Before using `addIoFiller`, run the `globalNetConnect` command to provide global-net-connection rules for supply pins of the added fillers. Without these rules, the built-in design-rule checks of `addIoFiller` will not be accurate.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `addIoFiller` parameter. For a detailed description of the command and all of its parameters, use the man command: `man addIoFiller`
`-cell {name_list}`	Specifies the name list of the I/O filler cells to be added. *Data_type*: list, required
`-deriveConnectivity`	Derives connectivity for I/O fillers. *Data_type*: bool, optional
`-fillAnyGap`	Forces the I/O filler instance into a gap even though the gap (clearance) is not large enough. *Default*: If you do not specify this parameter, it does not force a filler instance. *Data_type*: bool, optional
`-fillerOrient R0 | R90 | R180 | R270 | MX | MX90 | MY | MY90`	
	Specifies the orientation value of the filler cell. The orientation value can be R0, R90, R180, R270, MX, MX90, MY, or MY90. *Default*: R0 *Data_type*: string, optional
`-from coord`	Specifies the starting offset from the edge for adding fillers. The values are in micrometers. **Note:** The `-from` and `-to` parameters are intended to be used with the `-side` parameter to indicate a range. This command is applicable to peripheral I/O only; therefore, it is only one dimensional. *Data_type*: float, optional
`-logic`	Enables the creation of I/O filler instances for non-physical I/O cells. The added IO fillers are not marked as physical only cells. They are saved in netlist if user does saveNetlist. *Data_type*: bool, optional
`-prefix prefix`	Specifies the prefix name for the new I/O filler instances. *Default*: `FILLER` *Data_type*: string, optional
`-row rowNumber`	Specifies the row number for inserting fillers in a multiple I/O row design. *Minimum*: 0 *Maximum*: 1 *Data_type*: int, optional

`-side {top | bottom | left | right}`	
	Specifies the side as top side, bottom side, left side, and right side of the I/O box. *Default*: If you do not specify this parameter, all sides are specified. *Data_type*: string, optional
`-to` *coord*	Specifies the ending offset from the edge for adding fillers. The values are in micrometers. **Note:** The `-from` and `-to` parameters are intended to be used with the `-side` parameter to indicate a range. This command is applicable to peripheral I/O only; therefore, it is only one dimensional. *Data_type*: float, optional
`-useSmallIoHeight`	Specifies that the filler cell should be inserted between I/O pads only when the smallest I/O pad has the same height as the height of the filler cell. For example, consider that there are I/O pads A, B, C, D, and E. Out of these, A, B, and E are the same height, and C and D have a height double that of A, B, and E. Assume that you want to insert an I/O filler cell F, which has the same height as A, B, and E. If you do not specify the `-useSmallIoHeight` parameter, the cell F will be inserted between A and B, B and C, C and D, and D and E. However, if you specify the `-useSmallIoHeight` parameter, the cell F will be inserted between A and B, B and C, and D and E. The cell will not be inserted between C and D, because both C and D have a height different from F. *Data_type*: bool, optional

Examples

- The following command adds I/O instances to the I/O pad area on all sides wherever there is space between existing I/O pads. The added I/O pad filler instance names have a prefix PAD8.
  ```
  addIoFiller -cell PAD8 -prefix PAD8
  ```
- The following command adds I/O instances to the I/O pad area on the top side from 200 micrometers. The added I/O pad filler instance names have a prefix PAD8.
  ```
  addIoFiller -cell PAD8 -prefix PAD8 -side top -from 200
  ```
- The following command adds I/O instances to the I/O pad area on the left side to 300 micrometers. The added I/O pad filler instance names have a prefix PAD8.
  ```
  addIoFiller -cell PAD8 -prefix PAD8 -side left -to 300
  ```

addIoInstance

```
addIoInstance
[-help]
[-cell {name1 name2 ...}]
-inst {inst1 inst2 ...}
{{-refInst inst_name [-ccw]} | {-selected [-ccw]} |
{-repeat num [-skip num]
[-inSelected | [-ioRing num] -side {N | W | S | E} | -ioRow name]} | -loc llx lly }
[-spacing val]
[-orientation orient]
[-spread]
```

Specifies constraints for insertion of power and ground I/O instances in the I/O ring or in the I/O rows. This command inserts physical IO cells into design following constraints. It is used during floorplanning. If you do not specify any of the following parameters, the command `addIoInstance` adds I/Os for all I/O cells, on all sides and for all I/O rings.

- `-ioRing num`
- `-side`
- `-ioRow name`

Parameters

`-ccw`	Specifies the counter-clockwise direction to add the new I/O instance. *Data_type*: bool, optional
`-cell {name1 name2 ...}`	Specifies one or more cells. Adds one I/O for each cell that was specified. *Data_type*: string, optional
`-help`	Outputs a brief description that includes type and default information for each `addIoInstance` parameter.For a detailed description of the command and all of its parameters, use the man command: `man addIoInstance`
`-inSelected`	Repeatedly inserts new I/O instance(s) within the selected I/O cell(s). *Data_type*: bool, required
`-inst {inst1 inst2 ...}`	Specifies the instance name prefix for the new I/O. This must match with the number of cells that are specified. *Data_type*: string, required
`-ioRing num`	Specifies the I/O ring number in which the new I/O instance is added. *Default*: 0 *Data_type*: int, optional
`-ioRow name`	For the new I/O row flow, adds I/Os on the specified I/O row. *Data_type*: string, optional
`-loc x y`	Adds the new I/O instance at the location specified by *x y* coordinates. **Note**: You cannot use this parameter in conjunction with the `-refInst` or `-selected` parameters. *Data_type*: point, required

`-orientation` *orient*	Specifies the orientation of the new I/O instance. You can specify one of the following values: • `R0` • `R90` • `R180` • `R270` • `MX90` • `MY90` • `MX` • `MY` *Default*: `R0` Use this parameter with `-cell` and `-loc` parameters. **Note**: When specifying the `-refInst` or `-selected` parameters, the software uses the orientation from those instances. See Orientation Key for more information. *Data_type*: string, optional
`-refInst` *inst_name*	Specifies the name of the reference instance and adds the new I/O instance above or below the reference instance in clockwise direction. *Default*: Clockwise direction of the reference instance. *Data_type*: string, optional
`-repeat` *num*	Repeatedly adds new I/O instances every number (num) of cells that you specify. *Default*: Adds instances in the clockwise direction of the reference instance. *Data_type*: int, required
`-selected`	If `-repeat` is specified, this parameter adds the new I/O instance(s) in the selected cell(s) in clockwise direction of the selected instance. If `-repeat` is not specified, this parameter changes the selected cells as referenced cells and adds new I/O instances in the referenced cells, in the default clockwise direction. *Data_type*: bool, required
`-side {N | W | S | E}`	Specifies the side on which the new I/O instance is added. *Default*: `N` *Data_type*: string, optional
`-skip` *num*	Skips the number (num) of cells specified, before adding the first I/O instance. This happens only when `-repeat` num is specified. *Data_type*: int, optional
`-spacing` *val*	Specifies the spacing value, in microns, between the I/O instances. *Data_type*: float, optional
`-spread`	Evenly replaces all the I/O cells on the same row where the new I/O instance was added. This prevents overlapping of I/O cells. If you do not specify this parameter, the command still adds the new I/Os even if overlapping occurs. **Note**: The `addIoInstance` command works for both the I/O flows, the old flow and the new row based pad placement flow. In the new flow, each time you add a new I/O instance, the I/Os on the I/O rows with the existing constraints are replaced. In this situation, if all the existing I/Os do not have any specific constraint defined, then the replacement of the I/Os also resolves overlapping each time when the I/O cell is added, evading the usage of `-spread` option. *Data_type*: bool, optional

Example

- The following command adds new I/O instance il to cell BUMPCELL at lower-left x location 100 and lower-left y location 100:
  ```
  addIoInstance -inst il -cell BUMPCELL -loc 100 100
  ```
- The following command inserts the I/O instance newIo for the cell PVDD on the West side of the I/O box, skipping 3 I/O's (from below) on the West side and repeating the insertion of I/O's every 2 instances.

```
addIoInstance -cell PVDD -repeat 2 -inst newIo -side W -skip 3 -spread
```

Related Information

- deleteIoInstance

addIoRowFiller

```
addIoRowFiller
[-help]
-cell {fillerCellNameList ...}
[-logic]
[-prefix prefix]
[[-ioRow name | -powerDomain powerDomainName]
[-fillerOrient R0 | R90 | R180 | R270 | MX | MX90 | MY | MY90]]
[-from coord] [-to coord]
[-fillAnyGap]
[-useSmallIoHeight]
[-ignoreSiteType]
```

Adds I/O filler cells in the I/O rows. The I/O filler cells are added between the gap of existing I/O pad instances where the gap is large enough for the I/O cell. Use this command during or after floorplanning.

Parameters

`-cell {`*`fillerCellNameList ...`*`}`	
	Specifies the name of the filler cell(s) to add in the I/O row. *Data_type*: string, required
`-fillAnyGap`	Forces the I/O filler instance into a gap even though the gap (clearance) is not large enough. *Default*: If you do not specify this parameter, it does not force a filler instance. *Data_type*: bool, optional
`-fillerOrient R0 | R90 | R180 | R270 | MX | MX90 | MY | MY90`	
	Specifies the orientation value of the filler cell. The orientation value can be R0, R90, R180, R270, MX, MX90, MY, or MY90. *Default*: `R0` *Data_type*: string, optional
`-from` *`coord`*	Specifies the coordinates of a specified starting range where I/O filler cells are added. The values are in micrometers. *Data_type*: float, optional
`-help`	Outputs a brief description that includes type and default information for each `addIoRowFiller` parameter. For a detailed description of the command and all of its parameters, use the man command: `man addIoRowFiller`
`-ignoreSiteType`	Ignores the I/O row site type. *Data_type*: bool, optional
`-ioRow` *`name`*	Specifies the name of the I/O row to add the filler cell. *Data_type*: string, optional
`-logic`	Adds logical I/O fillers to net list in top module. *Data_type*: bool, optional
`-powerDomain` *`powerDomainName`*	
	Adds I/O filler instances to the I/O rows associated with the specified power domain. *Data_type*: string, optional
`-prefix` *`prefix`*	Specifies the prefix name to be appended for the added I/O row filler cell. *Data_type*: string, optional
`-to` *`coord`*	Specifies the coordinates of a specified ending range where I/O row filler cells are added. The values are in micrometers. *Data_type*: float, optional
`-useSmallIoHeight`	Specifies that the filler cell should be inserted between I/O pads only when the smallest I/O pad has the same height as the height of the filler cell. For example, consider that there are I/O pads A, B, C, D, and E. Out of these, A, B, and E are the same height, and C and D have a height double that of A, B, and E. Assume that you want to insert an I/O filler cell F, which has the same height as A, B, and E. If you do not specify the `-useSmallIoHeight` parameter, the cell F will be inserted between A and B, B and C, C and D, and D and E. However, if you specify the `-useSmallIoHeight` parameter, the cell F will be inserted between A and B, B and C, and D and E. The cell will not be inserted between C and D, because both C and D have a height different from F. *Data_type*: bool, optional

Example

- The following command adds I/O instances to the I/O pad area on all sides wherever there is space between existing I/O pads. The added I/O pad filler instance names have a prefix PAD8.
  ```
  addIoRowFiller -cell PAD8 -prefix PAD8
  ```

addModuleToFPlan

```
addModuleToFPlan
[-help]
hInstName
[add_or_remove]
```

Use this command to display modules in the floorplan view whose instance count is smaller than the `setPreference MinFPModuleSize` value. By default, modules whose instance count is less than `MinFPModuleSize` are not displayed (default is 1). The `MinFPModuleSize` variable can be set to a larger value to focus only on larger modules which require floorplanning. You can then display specific smaller modules using this command. For example, use `addModuleToFPlan` if you need to interactively floorplan small regions or fences to control placement of small modules of logic.

Note: You can change the *Min. floorplan Module Size* option in the *Preferences* form in the *Display* menu and import the design. Alternatively, you can use the `setPreference MinFPModuleSize value` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `addModuleToFPlan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man addModuleToFPlan`
hInstName	Specifies the name of the hierarchical instance. *Data_type*: string, required
add_or_remove	Adds or removes the specified hierarchical instance. Specify 1 to add or 0 to remove. *Data_type*: int, optional

Example

- The following command adds hierarchical instance SH99 in the floorplan view:
  ```
  addModuleToFPlan SH99 1
  ```
- The following command only displays modules with 200 instances or more:
  ```
  setPreference MinFPModuleSize 200
  ```

  If module mcore0/a0 has less than 200 instances you can display it using:
  ```
  addModuleToFPlan mcore0/a0 1
  ```

  To disable its display:
  ```
  addModuleToFPlan mcore0/a0 0
  ```

Related Information

- `setPreference`
- Floorplanning the Design chapter in the *Innovus User Guide*

addObjFPlanCutBox

```
addObjFPlanCutBox
[-help]
type
name
boxlist
```

Specifies the rectilinear shape of floorplan objects by describing the cut out area. The floorplan objects include block top cell, module constraint (guide, region, fence), layershape, pin, net, group, and instance. The command creates a rectilinear cut box for an object. A rectilinear object is comprised of two or more boxes. To use this command, divide the required cut out area into one or more bounding boxes and specify the coordinates of each bounding box in the command. Once you run the command, the rectilinear cut area disappears from the object after a redraw. You can use the command at any point in the design flow.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `addObjFPlanCutBox` parameter. For a detailed description of the command and all of its parameters, use the man command: `man addObjFPlanCutBox`
`name`	Specifies the name of the object for type. *Data_type*: string, required
`type`	Specifies the type of object for name. This can be: • `Cell` • `Group` • `Instance` • `Layershape` • `Module` • `Net` • `Pin` *Data_type*: string, required
`boxList`	Specifies the rectilinear shape of an object. The box list must be specified in the following format: `{{x1 y1 x2 y2} ....}` *Data_type*: list, required

Example

The following example defines the rectilinear shape of the module module_A by specifying 2 rectilinear cut boxes defined by coordinates (x1, y1), (x2, y2), (x3, y3), and (x4, y4).

```
addObjFPlanCutBox Module module_A {{x1 y1 x2 y2} {x3 y3 x4 y4}}
```

addRoutingHalo

```
addRoutingHalo
[-help]
{ {-bottom bottomLayer -space haloValue -top topLayer} | -lithoHalo }
{-allBlocks | -block blockNameList | -cell cellNameList | -inst instanceName | -designHalo }
```

Adds a routing halo for blackboxes, hard macros, or block-level designs. A routing halo significantly reduces the possibility of long wire routing within the specified area, thus helping reduce signal integrity violations at the top- and/or block-level designs. A routing halo is honored only by the signal router. The signal router treats routing on the specific routing layers in the routing halo area as very high cost routing. However, perpendicular routing or straight connections to pins are acceptable. The special router does not honor routing halos. To block special routing, use routing blockages instead. You can specify a routing halo for:

- hard macros or blackboxes
- block-level designs
- partitions

For the bottom-up hierarchical flow, use this command to specify routing halo for a block at the top-level design or at the block-level design. The routing halo can be stored as an instance and/or design property and can be viewed through the attribute editor for the instance block. The routing halo can be saved to or restored from a floorplan file. Use this command after importing a design.

Notes:

- For top-down hierarchical flow, specify routing halo for a partition through the `definePartition` command or through the *Specify Partition* form.
- A halo is not allowed on std-cells (cells with CLASS CORE SITE) and is written out as ROUTEHALO in DEF. A design halo is written out as a DEF design FE_ROUTING_HALO property and a litho halo is written out as a DEF component LITHOHALO property.

Parameters

`-allBlocks`	Specifies that the routing halo should be added to all blocks in the design. *Data_type*: bool, required
`-block` *blockNameList*	Specifies that the routing halo should be added to the specified blocks. A block name must be an instance name and not a cell master name. The specified blocks should be separated by a space. **Note:** A halo is not allowed on std-cells (cells with CLASS CORE SITE) and is written out as ROUTEHALO in DEF. A design halo is written out as a DEF design FE_ROUTING_HALO property and a litho halo is written out as a DEF component LITHOHALO property. *Data_type*: list, required
`-bottom` *bottomLayer*	Specifies the bottom layer for the routing halo. **Note:** Even though the `-bottom`, `-space`, and `-top` parameters are optional, it is important to specify all of them together. *Data_type*: string, required
`-cell` *cellNameList*	Specifies that the routing halo should be added to all insts of the specified cell names. *Data_type*: list, required
`-designHalo`	Specifies that the routing halo should be added inside design boundary. **Note:** The `-designHalo` parameter cannot be specified with the `-lithoHalo` parameter. These parameters are mutually exclusive. *Data_type*: bool, required
`-help`	Outputs a brief description that includes the type and default information for each `addRoutingHalo` parameter. For a detailed description of the command and all of its parameters, use the man command: `man addRoutingHalo`
`-inst` *instanceName*	Specifies that the routing halo should be added to the specified instance. This parameter can be useful for adding halo for I/O cells. *Data_type*: list, required
`-lithoHalo`	Adds a litho halo to the instances on each routing layer with `LEF LITHOMACROHALO` defined. **Notes:** • The `-lithoHalo` parameter cannot be specified with the `-designHalo` parameter. These parameters are mutually exclusive. • The `-lithoHalo` parameter requires some LEF LITHOMACROHALO values to be set. • A halo is not allowed on std-cells (cells with CLASS CORE SITE) and is written out as ROUTEHALO in DEF. A design halo is written out as a DEF design FE_ROUTING_HALO property and a litho halo is written out as a DEF component LITHOHALO property. • *Data_type*: bool, required
`-space` *haloValue*	Specifies the routing halo value in microns. **Note:** Even though the `-bottom`, `-space`, and `-top` parameters are optional, it is important to specify all of them together. *Minimum*: 0 *Maximum*: 1.79769313486232e+308 *Data_type*: float, required
`-top` *topLayer*	Specifies the top layer for the routing halo. **Note:** Even though the `-bottom`, `-space`, and `-top` parameters are optional, it is important to specify all of them together. *Data_type*: string, required

Examples

- The following command adds a routing halo of 10 microns to all blocks and specifies that the top and the bottom layers for the routing halo are Metal7 and Metal1, respectively.
  ```
  addRoutingHalo -space 10 -top Metal7 -bottom Metal1 -allBlocks
  ```
- The following command adds a routing halo of 5 microns to the specified blocks and specifies that the top and the bottom layers for the routing halo are Metal2 and Metal1, respectively.
  ```
  addRoutingHalo -block DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST DTMF_INST/RAM_128x16_TEST_INST/RAM_128x16_INST -space 5 -top
  ```

```
Metal2 -bottom Metal1
```

addSizeBlockage

```
addSizeBlockage
[-help]
[-name blockageName]
[-isResizeable]
-box x1 y1 x2 y2
```

Adds a size blockage object that controls the behavior of the resize line under a covered area. The object area prevents floorplan objects in this area from being resized and maintains the alignment and minimum space between these objects during floorplan resize. Size blockage is special kind of blockage that is only honored by the `resizeFloorplan` command. By default resize line can not go through size blockage, which means, objects under size blockage stay fixed after floorplan resize. You can use this command before using the `resizeFloorplan` command.

Parameters

`-box x1 y1 x2 y2`	Specifies the lower left x coordinate, lower left y coordinate, upper right x coordinate, and upper right y coordinate respectively of the size blockage area. *Data_type*: box, required
`-help`	Outputs a brief description that includes type and default information for each `addSizeBlockage` parameter. For a detailed description of the command and all of its parameters, use the man command: `man addSizeBlockage`
`-isResizeable`	Specifies that the size blockage can be resized, however alignment and the minimum space between the objects in the blockage area will be maintained during floorplan resize. When this options is specified, the resize line can go through size blockage. But it can not turn direction inside blockage. The benefit of using this option is if objects (for example, macros) under size blockage are aligned before calling `resizeFloorplan`, they will stay aligned after the command. *Data_type*: bool, optional
`-name blockageName`	Specifies the name of the size blockage. *Data_type*: string, optional

Example

The following command creates a size blockage.

```
addSizeBlockage -name sizeBlkg1 -box 400 400 500 500
```

adjustFPlanChannel

```
adjustFPlanChannel
[-help]
[-channelUtil utilizationValue]
[-constraints constraint_file]
[-moveOnly]
[-report output_file]
[-reportOnly [-report_low_utilized_channels value]
  [-type {all fenceToFence fenceToCore fenceToMacro macroToMacro macroToCore}]]
```

Automatically adjusts the channel width between objects to prevent potential routing congestion. You can use this command after importing the design, loading a completed floorplan, and then running the `place_design` and `earlyGlobalRoute` commands.

Parameters

`-channelUtil utilizationValue`	
	Specifies the maximum utilization of routing tracks in a channel. *Data_type*: float, optional
`-constraints constraint_file`	
	Specifies the file that contains constraints for floorplan objects. A constraint file is a text file that can contain a list of seeds to use when generating fences and module guides, and basic relative, spacing and orientation constraints to follow during macro placement. *Data_type*: string, optional
`-help`	Outputs a brief description that includes type and default information for each `adjustFPlanChannel` parameter. For a detailed description of the command and all of its parameters, use the man command: `man adjustFPlanChannel`
`-moveOnly`	Specifies that only move-only adjustment is allowed. *Data_type*: bool, optional
`-report output_file`	Generates a report that contains the channel congestion, targeted channel adjustment, and final real floorplan adjustment. *Default*: `topcell.channel` *Data_type*: string, optional
`-reportOnly`	Generates a report of the channel congestion without adjusting the floorplan. *Data_type*: bool, optional
`-report_low_utilized_channels value`	
	Reports channel congestion whose track utilization is lower than the user-specified threshold value. *Minimum*: 0 *Maximum*: 1.0 *Data_type*: float, optional
`-type {all fenceToFence fenceToCore fenceToMacro macroToMacro macroToCore}`	
	Reports channel congestion for specified type. You can specify more than one type at a time. *Default*: `all` *Data_type*: enum_list, optional

Example

- The following command generates a report of only fence-to-fence congestion, without adjusting the floorplan:
  ```
  adjustFPlanChannel -reportOnly -type {fenceToFence}
  ```
- The following command generates a channel congestion report without adjusting the floorplan:
  ```
  adjustFPlanChannel -reportOnly -report reportfile
  ```

  The following report is generated:

  ```
  Channel (315.48 357.67 361.60 511.57)
  Left: CORE
  Right: DTMF_INST/PLLCLK_INST
  Congested utilization: 200/185 (108.1% V)
  Expected channel width increase: 6.48 um

  Channel (315.48 511.57 351.33 646.17)
  Left: CORE
  Right: DTMF_INST/RAM_128x16_TEST_INST/RAM_128x16_INST
  Congested utilization: 128/117 (109.4% V)
  Expected channel width increase: 5.51 um

  Channel (466.52 646.17 792.28 670.01)
  Bottom: DTMF_INST/RAM_128x16_TEST_INST/RAM_128x16_INST
  Top: DTMF_INST/ROM_512x16_0_INST
  Congested utilization: 52/42 (123.8% H)
  Expected channel height increase: 7.38 um
  ```

- Floorplanning the Design chapter in the *Innovus User Guide*

alignObject

```
alignObject
[-help]
-side {right | left | center | top | bottom | middle}
[-referToFirst]
[-mix]
```

Aligns objects (instances, modules, or blockages) vertically or horizontally in the floorplan. Use this command after selecting two or more objects in the design display area.

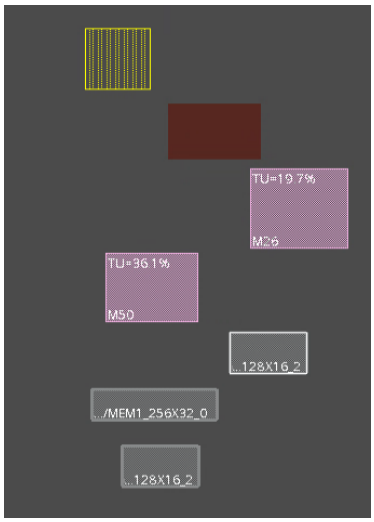
Parameters

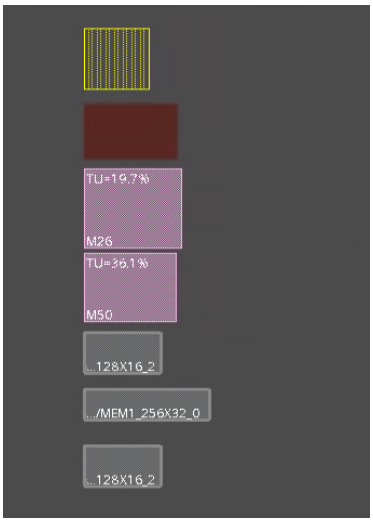
`-help`	Outputs a brief description that includes the type and default information for each `alignObject` parameter. For a detailed description of the command and all of its parameters, use the man command: `man alignObject`
`-mix`	Considers all the selected objects together while aligning them. *Data_type:* bool, optional
`-referToFirst`	If you specify this option, the first selected object is the reference object. *Data_type:* bool, optional
`-side {right | left | center | top | bottom | middle}`	
	Specifies the vertical and horizontal alignment for the selected objects. Choose one of the following: • `right`: Specifies vertical right alignment. • `left`: Specifies vertical left alignment. • `center`: Specifies vertical center alignment. • `top`: Specifies horizontal top alignment. • `bottom`: Specifies horizontal bottom alignment. • `middle`: Specifies horizontal middle alignment. *Data_type:* string, required

Example

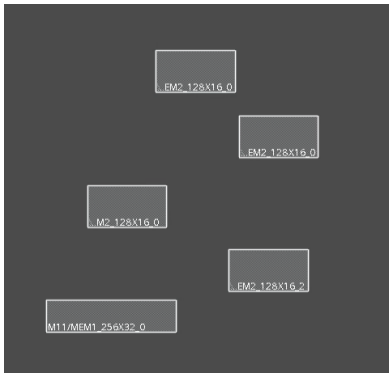
- The following command aligns the selected objects (Block) vertically to the left:
  ```
  alignObject -side left
  ```
  Before: After:

- The following command aligns the selected objects (Blockage、Module、Block) vertically to the left：
  ```
  alignObject -side left -mix
  ```
  Before: After：





- The following command aligns the selected objects (Block) vertically to the left：
  ```
  alignObject -side left -referToFirst
  ```
  Before：



After：

changeFloorplan

```
changeFloorplan
[-help]
[-noSnapToGrid]
[[-coreToLeft value][-coreToBottom value][-coreToRight value][-coreToTop value] |
[-coreToEdge {left bottom right top}]]
```

Changes the distances between the core box and the die box on the sides you specified. Use this command after specifying the floorplan data or running an initial floorplan.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `changeFloorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man changeFloorplan`
`-coreToBottom value`	Specifies the distance from the bottom of the core box to the bottom of the die box. *Data_type*: float, optional
`-coreToEdge {left bottom right top}`	
	Specifies the distances between the core box and die box on each side (left, bottom, right, and top). *Data_type*: box, optional
`-coreToLeft value`	Specifies the distance from the left of the core box to the left of the die box. *Data_type*: float, optional
`-coreToRight value`	Specifies the distance from the right of the core box to the right of the die box. *Data_type*: float, optional
`-coreToTop value`	Specifies the distance from the top of the core box to the top of the die box. *Data_type*: float, optional
`-noSnapToGrid`	Specifies that the core box (or die box) boundary will not be snapped to the nearest metal pitch even if the specified die/ core box size is not an integer multiple of the smallest metal pitch. This prevents the input floorplan boxes from being changed. *Data_type*: bool, optional

Example

- The following command changes the distance from the bottom of the core box to the bottom of the die box to 200:
  ```
  changeFloorplan -coreToBottom 200
  ```

Related Information

- `saveDesign`
- `saveFPlan`

changeIoConstraints

```
changeIoConstraints
[-help]
[-forceIt]
[-ioOrder {clockwise | counterclockwise | default} | -row string]
[-spacing num | -removeSpacing]
[-endSpace num | -removeEndSpace]
[-firstCellSpacing float| -removeFirstCellSpacing]
[-removeAll]
```

Changes the constraints of an I/O row defined in the I/O constraint file. If you do not specify the name of the I/O row, the command modifies all the I/O rows. You can use this command to move a IO pad .

Parameters

`-endSpace num`	Specifies the space, in µmeters, between the corner pad and the last I/O pad for the specified side of the row. *Default*: `0` *Data_type*: float, optional
`-firstCellSpacing float`	
	Specifies the distance, in µmeters, from the first cell to the beginning of the I/O row, based on the I/O order. *Data_type*: float, optional
`-forceIt`	Forces the I/O constraints to run on a non I/O row flow. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `changeIoConstraints` parameter. For a detailed description of the command and all of its parameters, use the man command: `man changeIoConstraints`.
`-ioOrder {clockwise | counterclockwise | default}`	
	Changes the I/O placement order on all the rows. **Note:** This parameter is ignored if you specify a row name. *Default*: `default` *Data_type*: string, optional
`-removeAll`	Removes all the existing constraints on the I/O's. Evenly distributes all the I/O's in the rows. *Data_type*: bool, optional
`-removeEndSpace`	Removes the end space of the row. *Data_type*: bool, optional
`-removeFirstCellSpacing`	
	Removes the spacing of the first cell. *Data_type*: bool, optional
`-removeSpacing`	Remove the spacing constraint from I/O cells on a row.
`-row string`	Specifies the name of the row to modify the I/O constraints. *Default*: 1 *Data_type*: string, optional
`-spacing num`	Specifies the global spacing, in µmeters, for all the I/O's on a row. **Note:** `changeIoConstraints -ioOrder -spacing num` does not modify the spacing of corner I/O pads. *Default*: 0 *Data_type*: float, optional

Example

- The following command removes the spacing constraint from all I/O rows defined in the I/O constraint file:
  ```
  changeIoConstraints -removeSpacing
  ```

check_macro_place_constraint

```
check_macro_place_constraint
[-help]
```

Checks the constraints of macros which will be honored during the macro placer. To define the constraints of macros, use the `set_macro_place_constraint` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_macro_place_constraint` parameter. For a detailed description of the command and all of its parameters, use the man command: `man check_macro_place_constraint`

Example

- The following command checks the constrains of macros:
  ```
  check_macro_place_constraint
  ```

Related Information

- `create_pg_model_for_macro_place`
- `get_macro_place_constraint`
- `reset_macro_place_constraint`
- `set_macro_place_constraint`
- `write_macro_place_constraint`

check_ufc

```
check_ufc
[-help]
fileName
[-include_all_rules]
[-report_file string]
[-report_unplaced_block]
[-selected_rules string]
```

Checks the floorplan based on the user specified UFC rules defined in the UFC file and reports violations. These violations can be seen in the *Violation Browser*.

Note: The Unified Floorplan Constraints (UFC) methodology is a powerful Innovus capability that can define several rules on floorplan objects, check specified rules, and report the violations with rule name as well as severity. The violations can be shown in the violation browser. UFC also provides the ability to automatically fix specific violations. It can add routing blockages, snap macro location, adjust core shape to fix corresponding violations. In addition, UFC also provides the ability to exclude rules from checking for specified objects.

Usage Model:

- Load the Design.
- Create a UFC file with floorplan rules.
- Run UFC checking. (`check_ufc`)
- Fix reported violations. (`fix_floorplan`)

Note: The check_ufc command honors the `setFPlanMode -no_cut_row` parameter that specifies if rows are not required to be cut before operations. With `setFPlanMode -no_cut_row false` or not specified, the check_ufc command will work based on the current row shape. If there are rules for rows in the UFC file and the rows are not cut before, there will be many wrong violations reported out. So the rows for objects like insts, place blockages are expected to cut out before using the `check_ufc` command. If rows are not cut before the check_ufc command is run, with `setFPlanMode -no_cut_row true`, the tool identifies the rows have not been cut before. It calls the `cutRow` command to get a cut row shape during the `check_ufc` command. The `cutRow` command cuts the rows for insts, hinsts, place blockages, route blockages, power domains, groups, or bumps by default. The check_ufc command will work based on the cut row shape. The actual row shape is not changed after these operations. You can still get the expected check result for row's rule without running the `cutRow` before.

Parameters

fileName	Specifies the name of file containing the rules or constraints. *Data_type*: string, required
-help	Prints a brief description that includes type and default information for each `check_ufc` parameter. For a detailed description of the command and all of its parameters, use the man command: `man check_ufc`
-include_all_rules	Enables the tool to report the summary of violations for all rules. *Data_type*: bool, optional
-report_file *string*	Specifies the name of the file that saves the report summary. *Data_type*: string, optional
-report_unplaced_block	Enables the tool to show the number of unplaced macros in summary. *Data_type*: bool, optional

-selected_rules *string*	Specifies that only the selected rules will be checked.
	Note: The `-selected_rules` parameter supports the variable format for specifying the rule list.
	For example, you can define a rule in the UFC file and then use the `check_ufc` command to check the rule.
	`set sanity_rules 'A C'`
	`check_ufc file.ufc -selected_rules $sanity_rules`
	Here, rule A and C will be checked
	Data_type: string, optional

Example

- The following command checks the floorplan based on the *DMTB_ENC.ufc* file that contains the user specified UFC rules:

```
check_ufc DMTB_ENC.ufc
```

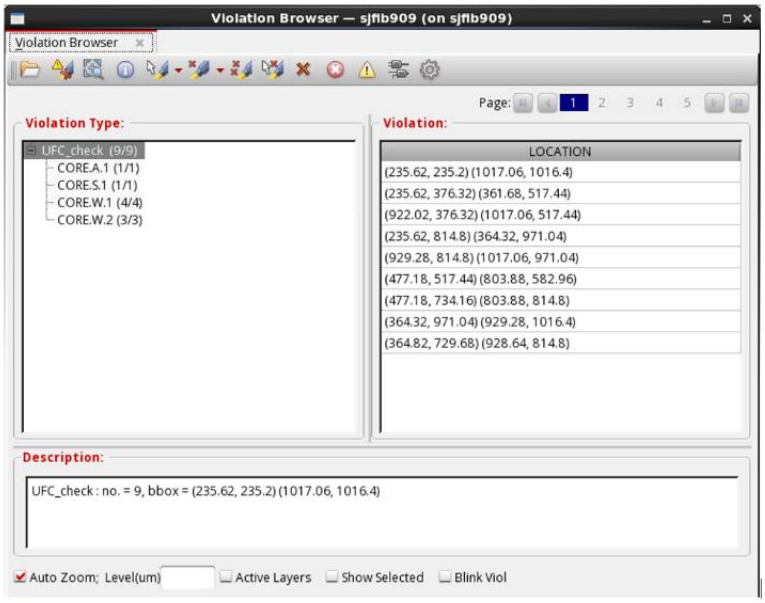
The input UFC file is like this:

```
set_area_rule -name CORE.A.1 -obj [available_sites] {.area < 500} \
  -description {The area of available sites should be lesser than 500}
set_width_rule -name CORE.W.1 -obj [available_sites] -direction horizontal -type simple {.width > 200} \
  -description {The horizontal simple width of available sites must be larger than 200}
set_width_rule -name CORE.W.2 -obj [available_sites] -direction vertical -type simple {.width > 100} \
  -description {The vertical simple width of available sites must be larger than 100}
set_spacing_rule -name CORE.S.1 -obj [base_cells -if {.name ==ram_256x16A}] -ref [base_cells -if {.name == rom_512x16A}] -direction
vertical {on_grid (.spacing-0.1,0.2)} \
  -description {The vertical spacing between macro ram_256x16A and rom_512x16A must be 0.2*n + 0.1}
set_spacing_rule -name CORE.S.2 -obj [base_cells -if {.name ==rom_512x16A}] -ref [base_cells -if {.name == ram_128x16A}] -direction
vertical {.spacing > 10} \
  -description {The vertical spacing between macro rom_512x16A and ram_128x16A must larger than 10}
```

Following is an example of report summary of UFC checking after running the check_ufc command. The violations can be seen in the Violation Browser.

```
--------------------------Summary of UFC Checking ---------------------------------------
RuleName Count  Description                                                          ViolatedObjects
........ .....  ...........................                                          ......................
CORE.A.1   1    The area of available sites should be lesser than 500                available_sites
CORE.S.1   1    The vertical spacing between macro ram_256x16A and rom_512x16A must be 0.2*n + 0.1
 DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST
CORE.W.1   4    The horizontal simple width of available sites must be larger than 200       available_sites
CORE.W.2   3    The vertical simple width of available sites must be larger than 100         available_sites
```

The violations can be seen in the Violation Browser.



- The following command checks the floorplan based on the *DMTB_ENC.ufc* file and includes all the rules:

```
check_ufc -include_all_rules
```

Following is an example of report summary:

```
--------------------------Summary of UFC Checking ---------------------------------------
RuleName Count  Description                                                          ViolatedObjects
```

```
........ .....  ............................                                                  ........................
CORE.A.1   1    The area of available sites should be lesser than 500                        available_sites
CORE.S.1   1    The vertical spacing between macro ram_256x16A and rom_512x16A must be 0.2*n + 0.1
 DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST
CORE.W.1   4    The horizontal simple width of available sites must be larger than 200        available_sites
CORE.W.2   3    The vertical simple width of available sites must be larger than 100          available_sites
CORE.S.2   0    The vertical spacing between macro rom_512x16A and ram_128x16A must be larger then 10
```

- The following command checks the floorplan based on the *DMTB_ENC.ufc* file and includes all the rules:
  ```
  check_ufc -include_all_rules -report_unplaced_block
  ```

  Following is an example of report summary:

  ```
  -------------------------Summary of UFC Checking ---------------------------------------
  RuleName Count  Description                                                               ViolatedObjects
  ........ .....  ............................                                              ........................
  CORE.A.1   1    The area of available sites should be lesser than 500                     available_sites
  CORE.S.1   1    The vertical spacing between macro ram_256x16A and rom_512x16A must be 0.2*n + 0.1
   DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST
  CORE.W.1   4    The horizontal simple width of available sites must be larger than 200    available_sites
  CORE.W.2   3    The vertical simple width of available sites must be larger than 100      available_sites
  CORE.S.2   0    The vertical spacing between macro rom_512x16A and ram_128x16A must be larger then 10
  **WARN: (IMPFP - 10100): There are 1 unplaced blocks. { DTMF_INST/PLLCLK_INST}. Tool doesn't check and fix violations for these blocks.
  ```

Related Information

- fix_floorplan

checkFPlan

```
checkFPlan
[-help]
[-outFile fileName]
[-reportUtil]
```

Checks the quality of the floorplan to detect potential problems before the design is passed on to other tools. This highlights the cells in the design display area with violation markers, where applicable. Use this command after specifying the floorplan data or running an initial floorplan. Run `checkFPlan` on your final floorplan file.

Notes:

- Parameters that you specify with the `setFPlanMode` command are used automatically whenever you run the `checkFPlan` command.
- Innovus honors the FinFET grid and automatically checks for the FinFET definition. If it detects a FinFET definition it enables support and sets the placement grid as FinFET grid by default. Since the height of all placeable objects must be a multiple of FinFET grid and the origin of these objects must be snapped to the FinFET grid. The checkFPlan command checks if all the supported objects (die box, core box, standard cell rows, I/O rows, blocks, IO pads, and standard cells) are aligned with FinFET grid and reports DRC violations.
- The `checkFPlan` command can check if the row's orientation is correct according to related tech site's SYMMETRY definition. It flags when Y SYMMETRY is missing from techlef CORE site definition.
- The `checkFPlan` command checks the pin snapping result.
  - For min width pins, it checks whether the pin center is snapped to the routing track with the same color.
  - For fat pins, it checks whether the pin center is snapped to the routing track and decides if the pin center should snap to the same or opposite colored routing track.
- The `checkFPlan` command checks if power stripes are on routing track for 10nm DPT layers (Metal1, Metal2, Metal3). It also checks power vias upper and lower metal shapes if they are not entirely covered by other power stripes on the same layers. Additionally it also checks if multi-height rows conflict with PG rails. In case of a conflict, a violation is reported.
- You can use the `checkFPlan` command to check if there are any existing overlaps between group boxes and power domain boxes as the box for a group should not physically overlap with the box for a power domain.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `checkFPlan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man checkFPlan`
`-outFile` *`fileName`*	Outputs detailed information for the specified checks. *Data_type:* string, optional
`-reportUtil`	Reports target utilization (TU) and effective utilization (EU) for the entire design, fences, and regions (partitions, power domains, and regular fences). *Data_type:* bool, optional

Example

- The following command checks the floorplan and writes the detailed information to the details.txt file. It also reports the final core utilization:
  ```
  checkFPlan -outFile details.txt -reportUtil
  ```

Related Information

- `setFPlanMode`
- `check_design`
- `checkFPlanSpace`
- Floorplanning the Design chapter in the *Innovus User Guide*

checkFPlanSpace

```
checkFPlanSpace
[-help]
[-outfile filename]
[-constraints filename | -trackUtil layerID value layerID value ...]
[-clearMarker]
```

Checks the floorplan for spacing rule violations and saves the violation information in a report. A marker is displayed at each violation spot. You can use the command at any point in the design flow.

Parameters

`-clearMarker`	Clears all space violation markers. *Data_type*: bool, optional
`-constraints filename`	Specifies the file that contains the spacing rules. A constraint file is a text file that can contain a list of seeds to use when generating fences and module guides, and basic relative, spacing and orientation constraints to follow during macro placement. *Data_type*: string, optional
`-help`	Outputs a brief description that includes type and default information for each `checkFPlanSpace` parameter. For a detailed description of the command and all of its parameters, use the man command: `man checkFPlanSpace`
`-outfile filename`	Writes the spacing rule violation information to the specified file. *Data_type*: string, optional
`-trackUtil layerID value layerID value ...`	
	Specifies the track utilization value on each routing layer from bottom to top, for example, `Metal1 value Metal1 value`. If the layer track utilization value is not specified, the default value is used. **Note:** The `checkFPlanSpace` command supports the model based space checker. It takes user provided track utilization numbers and technology information stored in the LEF file to estimate required minimum channel width between placed macros. This estimated minimum channel width (demand) is then compared to actual channel width (supply) in floorplan. A violation marker is displayed in GUI over the channel in which the supply is less than the demand. *Data_type*: list, optional

Example

- The following command checks the floorplan for spacing rule violations and saves the violation information in a `details.txt` report file;
  ```
  checkFPlanSpace -outFile details.txt
  ```

checkMacroLLOnTrack

```
checkMacroLLOnTrack
[-help]
-useLayerOffset
-useM2M3Track
```

By default, checks whether the lower left coordinates (llx, lly) of hard macros are at the intersection of Metal1/Metal2 tracks, and reports an error in Innovus if they are not. This is based on the assumption that Metal1 and Metal2 are both specified in opposite directions in a 65nm process. You can use this command after the floorplan is ready and want to make sure hard macro is on tracks.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `checkMacroLLOnTrack` parameter. For a detailed description of the command and all of its parameters, use the man command: `man checkMacroLLOnTrack`
`-useLayerOffset`	Checks pin alignment in a block against the layer offset of the design library. *Data_type*: bool, optional
`-useM2M3Track`	Checks the location of the macro against Metal2/Metal3 tracks if both Metal1 and Metal2 are specified in the same horizontal direction in a 40nm process. *Data_type*: bool, optional

Example

- The following command checks whether the lower left coordinates (llx, lly) of hard macros are at the intersection of Metal1/Metal2 tracks:
  ```
  checkMacroLLOnTrack -useLayerOffset -useM2M3Track
  ```

convertFenceToLef

```
convertFenceToLef
[-help]
hinst
[ptnName]
```

Converts a specified hierarchical instance or partition name to a LEF block. Use this command after floorplanning the design.

Note: This command runs the `savePartition` command for the specified partition as if it was at the top-level. This will overwrite any partition or hierarchical instance that is specified in the .lef file in the top partitioned subdirectory. In addition, the *ptnname.def* file will overwrite the partition's *ptn.def* subdirectory file.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `convertFenceToLef` parameter. For a detailed description of the command and all of its parameters, use the man command: `man convertFenceToLef`
hinst	Specifies the hierarchical instance cell name. *Data_type*: string, required
ptnName	Specifies the partition name. If this is not specified, the command uses the hierarchical instance cell name as the partition name. *Data_type*: string, optional

Example

The following command converts the results_conv hierarchical instance to a LEF block.

```
convertFenceToLef results_conv
```

Related Information

- `savePartition`
- Floorplanning the Design chapter in the *Innovus User Guide*

copyObject

```
copyObject
[-help]
```

Copies the selected placement or routing blockages. Use the `pasteObject` command to paste the copied object to the required location. You can use the `copyObject` command any time after floorplanning the design. You can also copy selected placement and routing blockages from the GUI by using the Copy tool. To access the Copy tool, choose *Edit - Copy* from the menu bar or press `F3` after clicking the *Copy* widget ( ) on the toolbar.

Note: The `copyObject` command currently works only for placement and routing blockages. Use the `editCopy` command to copy wires or vias.

Parameters

`-help`	Prints a brief description of the `copyObject` command. For a detailed description of the command, use the man command: `man copyObject`

Example

- The following commands copy and paste the selected placement and routing blockages:

  ```
  copyObject
  pasteObject -loc 10 20
  ```

Related Information

- `pasteObject`
- `editCopy`
- Floorplanning the Design chapter in the *Innovus User Guide*

create_bump_grid

```
create_bump_grid
[-help]
-grid_name string
-layers string
-origin {x y}
-pitch {x y}
```

Creates a bump grid. A bump grid is a grid for bump/TSV placement that helps in guiding bump placement and bump alignment.

Note:

- When you use the `savePartition` command, the tool recalculates the offset so that a bump can be aligned after assemble.
- The `saveFPlan` command saves the bump grid definition into *.fp file.
- The `loadFPlan` command loads the bump grid file while reading the design.

Parameters

`-grid_name string`	Specifies the bump grid name. *Data_type*: string, required
`-help`	Outputs a brief description that includes the type and default information for each `create_bump_grid` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_bump_grid`
`-layers string`	Specifies the layer names. You can specify the layer of a relative bump pin for this option. *Data_type*: string required
`-origin {x y}`	Specifies the coordinates of the origin of the bump grid. *Data_type*: point, required
`-pitch {x y}`	Specifies the spacing between two bumps. The first value (x) defines the horizontal spacing and the second value (y) defines the vertical spacing. *Data_type*: point, required

Example

- The following command creates a bump grid named myGridFront_9x9:
  ```
  create_bump_grid -grid_name myGridFront_9x9 -layers {UBM UBM1} -origin {50 50} -pitch {9 9}
  ```

Related Information

- `delete_bump_grid`
- Floorplanning the Design chapter in the *Innovus User Guide*

create_pg_model_for_macro_place

```
create_pg_model_for_macro_place
[-help]
{-file string}
```

Enables you to create pg models for the concurrent macro placement. This command saves PG modeling information to a Tcl file from the existing floorplan. This file is used to generate better congestion and wire-length modeling while placing the macros. You can use this command after the existing floorplan has been power planned.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `create_pg_model_for_macro_place` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_pg_model_for_macro_place`
`-file string`	Specifies the name of the file to which PG model details are written. *Data_type*: string, required

Example

After restoring the initial DB with power mesh, the following command can be used to create pg models for macro placement;

```
create_pg_model_for_macro_place -file golden_mimic_power_mesh.tcl
```

Related Information

- `check_macro_place_constraint`

- Using the Mixed Placer chapter in the *Innovus User Guide*

create_relative_floorplan

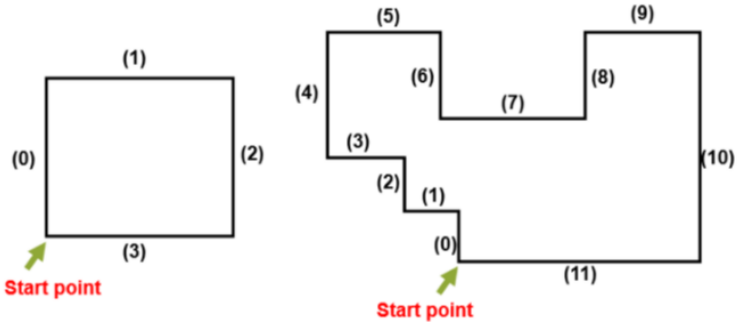
```
create_relative_floorplan
[-help]
{{{-place obj_name_list | -reshape obj_name_list} [-ref ref_obj_name_list]}}
[-place obj_name_list {-ref_type {{object core_boundary die_boundary}...}
 -horizontal_edge_separate {{ref_edge_horizontal y_offset obj_edge_horizontal}...}
 -vertical_edge_separate {{ref_edge_vertical x_offset obj_edge_vertical}...}}
[[-bbox {{none target reference both}...}]
 [-orient {{R0 R90 R180 R270 MX MY MX90 MY90}...}]]]
[-reshape obj_name_list { -dimension {{width height}...} }
[ [-fixed_edges {{edge1 edge2}...}] [-density {value}] [-offset {value}]]]
```

The `create_relative_floorplan` command captures and defines the placement relationship of floorplan objects independently from the actual coordinates in a floorplan, and resizes modules or blackboxes based on other floorplan objects, even outside the core boundary. You can use this command after importing the design.

Note: The `create_relative_floorplan` command accepts an array of objects. You can capture and define the placement relationship of an array of floorplan objects using just one command.

Note: You can use `writeFPlanScript -sections relativefplan` to save relative floorplan info.

Note: The edges are numbered as 0,1,2,3... from the low left corner in the clockwise direction. The left edge closest to the origin that has the smallest x,y coordinates is taken as the first zero edge. An even edge number donates a vertical edge and an odd edge number donates a horizontal edge. The following figure shows how to count the edges for a rectangle and rectilinear object.



Parameters

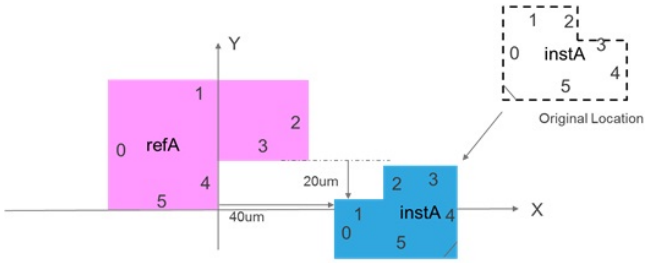
`-bbox {none target reference both}`	
	Specifies whether to use a bounding box instead of the rectilinear shape of target or reference object. *Default*: `none` *Data_type:* enum_list, optional
`-density value`	Specifies the target utilization (TU). By default, reshaping the object will keep the current TU. *Data_type:* string, optional
`-dimension {width height}`	Specifies the width or height of the referenced object as the reference dimension. *Default*: `width` *Data_type:* enum_list, optional
`-fixed_edges {edge1 edge2}`	Specifies that the reshape object will be stretched while fixing two perpendicular edges. *Default*: `{-1 0}` *Data_type:* string, optional
`-horizontal_edge_separate {ref_edge_horizontal y_offset obj_edge_horizontal}`	
	Specifies the vertical spacing between the horizontal edge of the target and reference objects. *Data_type:* string, optional
`-help`	Outputs a brief description that includes the type and default information for each `create_relative_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_relative_floorplan`
`-offset value`	Specifies the offset value from the reference object in the specified dimension. *Data_type:* string, optional
`-orient {R0 R90 R180 R270 MX MY MX90 MY90}`	
	Specifies the orientation of the target object. *Default*: `R0` *Data_type:* enum_list, optional
`-place obj_name_list`	Specifies the target object to place. It can be hInst, inst, group, power_domain, pin_guide, blockages, or port. *Data_type:* string, optional
`-ref ref_obj_name_list`	Specifies the reference object name. It can be hInst, inst, group, power_domain, pin_guide, blockages, port, or pin. It cannot be used with `-ref_type core_boundary` or `-ref_type die_boundary`. *Data_type:* string, optional
`-ref_type {object core_boundary die_boundary}`	
	Specifies the type of reference. *Default:* `object` *Data_type:* enum_list, optional
`-reshape obj_name_list`	Specifies the target object to reshape. It can be hInst,group, power_domain,pin_guide, or blockages. *Data_type:* string, optional
`-vertical_edge_separate {ref_edge_vertical x_offset obj_edge_vertical}`	
	Specifies the horizontal spacing between the vertical edge of the target and reference objects. *Data_type:* string, optional

Examples

Placing an Instance According to a Rectilinear Object

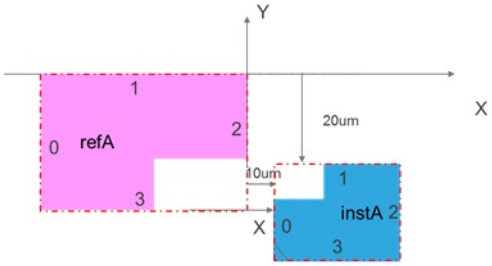
- The following command places an object with respect to a rectilinear object:

```
create_relative_floorplan -place instA -ref_type object -ref refA -orient MY \
        -horizontal_edge_separate {3 -20 1} -vertical_edge_separate {4 40 0}
```



- The following command places an object with respect to the bounding box of a rectilinear object:

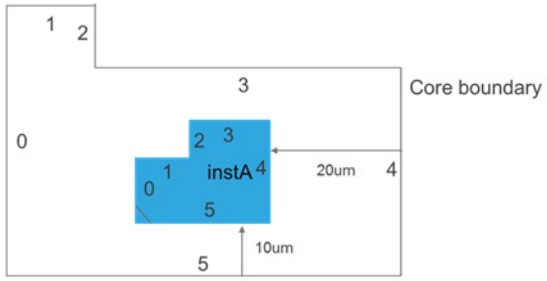
```
create_relative_floorplan -place instA -ref_type object -ref refA
        -horizontal_edge_separate {1 -20 1} -vertical_edge_separate {2 10 0} -bbox both
```



Placing an Instance According to the Core Boundary

- The following command places an object with respect to the core boundary:

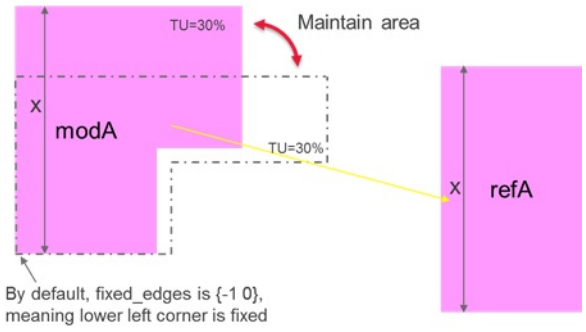
```
create_relative_floorplan -place instA -ref_type core_boundary \
       -horizontal_edge_separate {5 10 5} -vertical_edge_separate {4 -20 4}
```



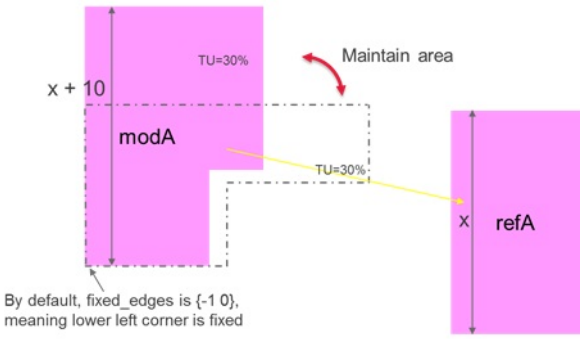
Reshaping an Instance in a Reference Dimension while Maintaining its Current Area

The following commands reshape an object based on a specified height while maintaining its current area:

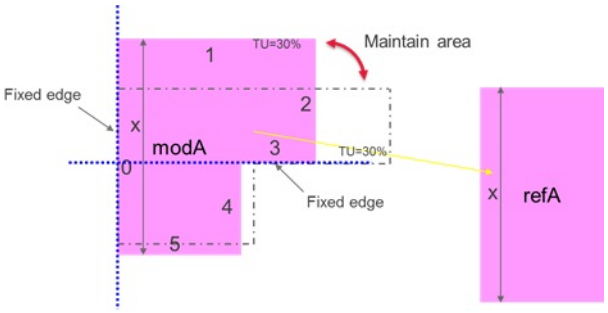
- `create_relative_floorplan -reshape modA -ref refA -dimension height`



- `create_relative_floorplan -reshape modA -ref refA -dimension height -offset 10`

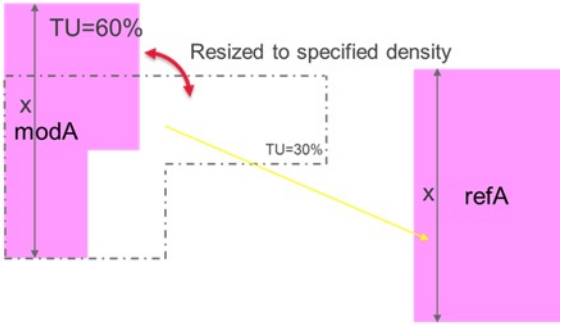


- `create_relative_floorplan -reshape modA -ref refA -fixed_edges {0 3} -dimension height`



Reshaping an Instance while Maintaining a Target Utilization Value

- The following command reshapes an object based on a specified height maintaining a target utilization value:
  `create_relative_floorplan -reshape modA -ref refA  -dimension height -density 0.6`



Placing multiple floorplan objects

- The following command places obj1, obj2, and obj3:
  `create_relative_floorplan -place {obj1 obj2 obj3} -ref {ref1 ref2 ref3} -ref_type {reftype1 reftype2 reftype3} -`

```
horizontal_edge_separate {-1 0 -1,-1 0 -1,-1 0 -1} -vertical_edge_separate {0 -100 2,0 -100 2,0 -100 2} -bbox {both target target} -
orient {MX90 R90 R90}
```

Related Information

- delete_relative_floorplan
- Floorplanning the Design chapter in the *Innovus User Guide*

createAbuttedFPlan

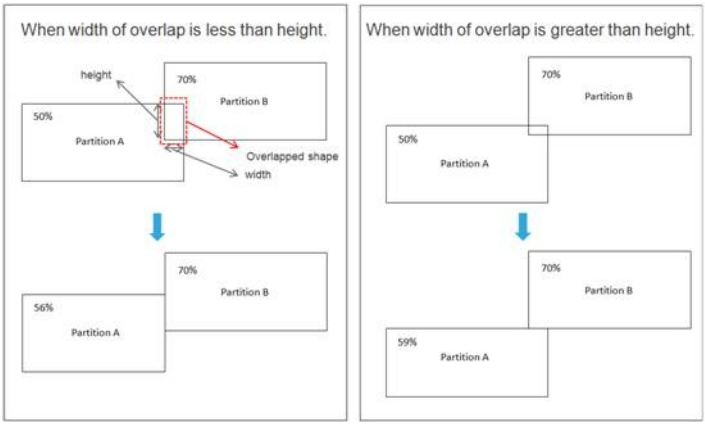
```
createAbuttedFPlan
[-help]
[-cutToFixOverlap]
[-honorPlaceBlockage blockageName]
[-ptnToCoreGap distance]
[-ptnToPtnGap distance]
{-hinsts hierarchicalInstanceList | -selected | -all}
```

Creates an abutted floorplan from an existing floorplan by fixing gaps between:

- Partitions
- Partition and core boundary
- Partition and macro when there is no overlap between the partition and the macro

Note:

- The `createAbuttedFPlan` command honors place blockage when the blockage has no overlap with the partition. It does not honor doughnut and master/clone partitions.
- When you use the `createAbuttedFPlan` command, partitions grow. The order in which partitions grow is top edge,bottom edge,left edge,right edge. Also, some partitions shrink when the `-ptnToPtnGap` option is used. The order in which partitions shrink is left edge, top edge, right edge, bottom edge.
- When there is an overlap between two partitions, if the width of the overlapped shape is less than the height, the partition with the lower TU shrinks horizontally. However, if the width of overlapped shape is bigger than the height, the partition with the lower TU shrinks vertically.

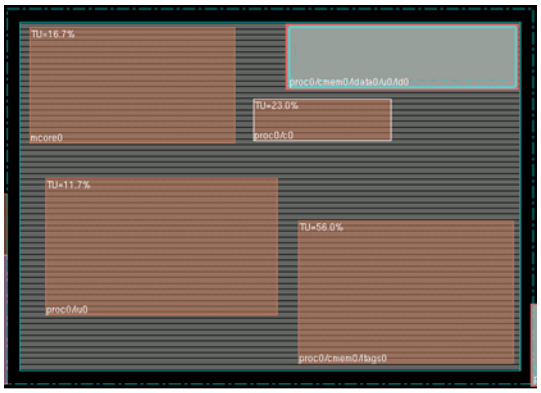


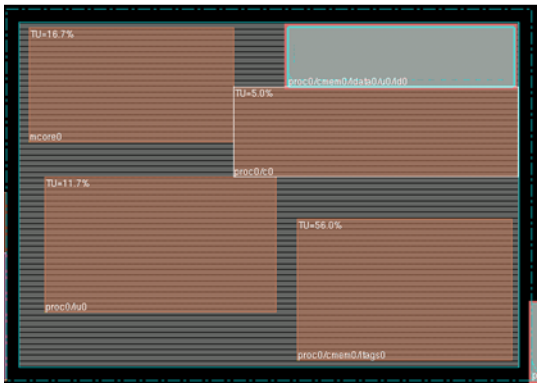
Parameters

`-help`	Outputs a brief description that includes the type and default information for each `createAbuttedFPlan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createAbuttedFPlan`
`-all`	Specifies to grow all partitions in the design. *Data_type*: bool, optional
`-cutToFixOverlap`	Cuts the overlapped partitions, if specified. Otherwise, the tool will shrink the partitions instead of cutting. *Data_type*: bool, optional
`-hinsts` *hierarchicalInstanceList*	Specifies a list of hierarchical instances that will be modified. *Default*: All partitions in the design. *Data_type*: string, optional
`-honorPlaceBlockage` *blockageName*	Specifies to fill gap upto the placement blockage boundary only. If a blockage name is specified, it honors only the specified blockage name. *Default*: Does not honor placement blockage. *Data_type*: string, optional
`-ptnToCoreGap` *distance*	Specifies the required distance (in micron) between a partition boundary and and a core boundary after growing the partition. *Default*: 0 micron *Data_type*: float, optional
`-ptnToPtnGap` *distance*	Specifies the required distance (in micron) between the partitions after growing the partitions. *Default*: 0 micron *Data_type*: float, optional
`-selected`	Specifies to grow selected partitions. *Data_type*: bool, optional

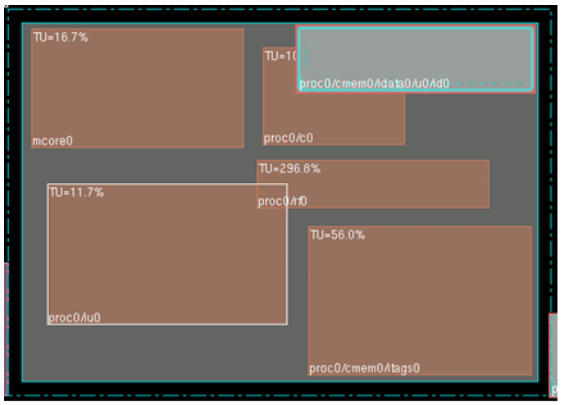
Examples

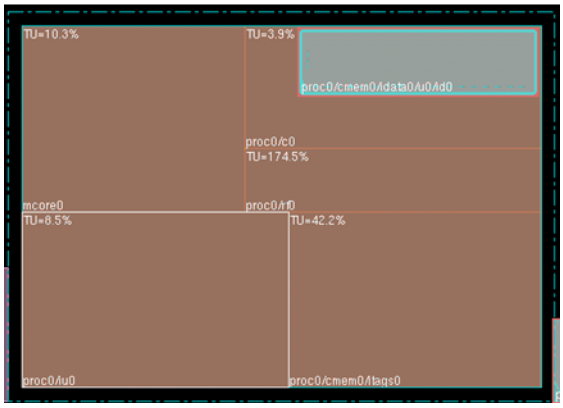
- The following command grows the selected partition
  ```
  createAbuttedFPlan -selected
  ```





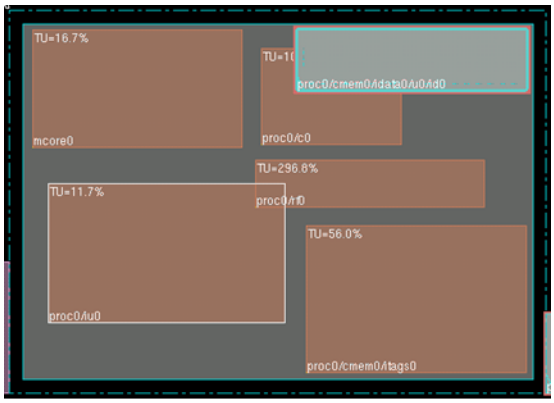
- If a partition overlaps another partition, the partition with higher target utilization keeps the original shape. The other partition shrinks to remove the overlap.
  The following command keeps the originals shape of proc0/rf0 and shrinks the other partitions to remove the overlap.
  ```
  createAbuttedFPlan -all
  ```

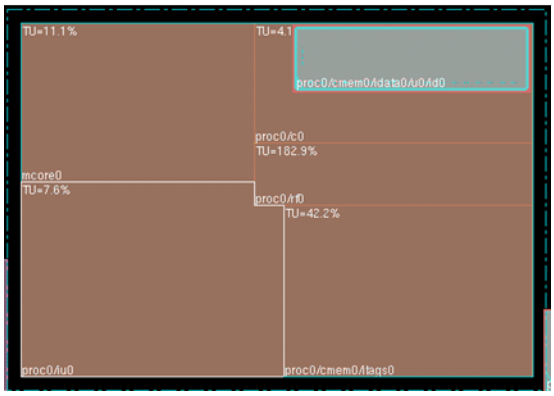




- The following command cuts the proc0/iu0 partition and keeps the original shape of the proc0/rf0 partition, which has higher utilization, to remove the overlap.

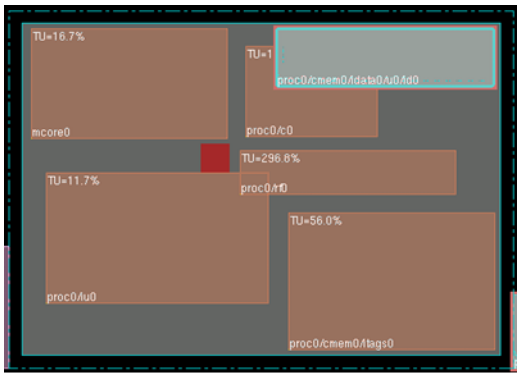
```
createAbuttedFPlan -cutToFixOverlap -all
```

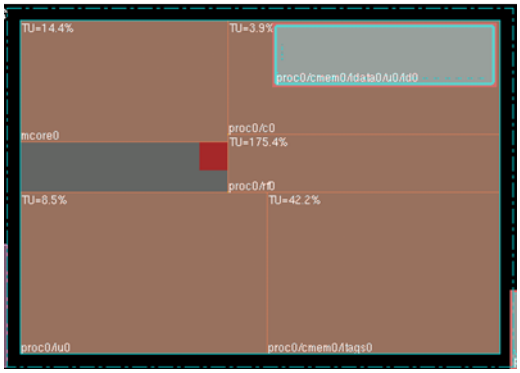




- The following command honors the place blockage which is not overlapping the partition by default.

```
createAbuttedFPlan -all -honorPlaceBlockage all
```





- The following command keeps the gap between two partitions, and between partitions and the core boundary after growing partition.
  ```
  createAbuttedFPlan -ptnToCoreGap 5 -ptnToPtnGap 5 -all -cutToFixOverlap
  ```

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

createDensityArea

```
createDensityArea
[-help]
box
density
[-name obj_name]
```

Creates a density screen area. A density screen area is a floorplan object used to assign standard cell placement density in the design area. The createDensityArea command can be used to create partial placement blockages even outside the core boundary. Use this command after importing the design.

Note: After creating the density screen area, you can double-click on the object in the design display area to open the Attribute Editor to change the density value.

Parameters

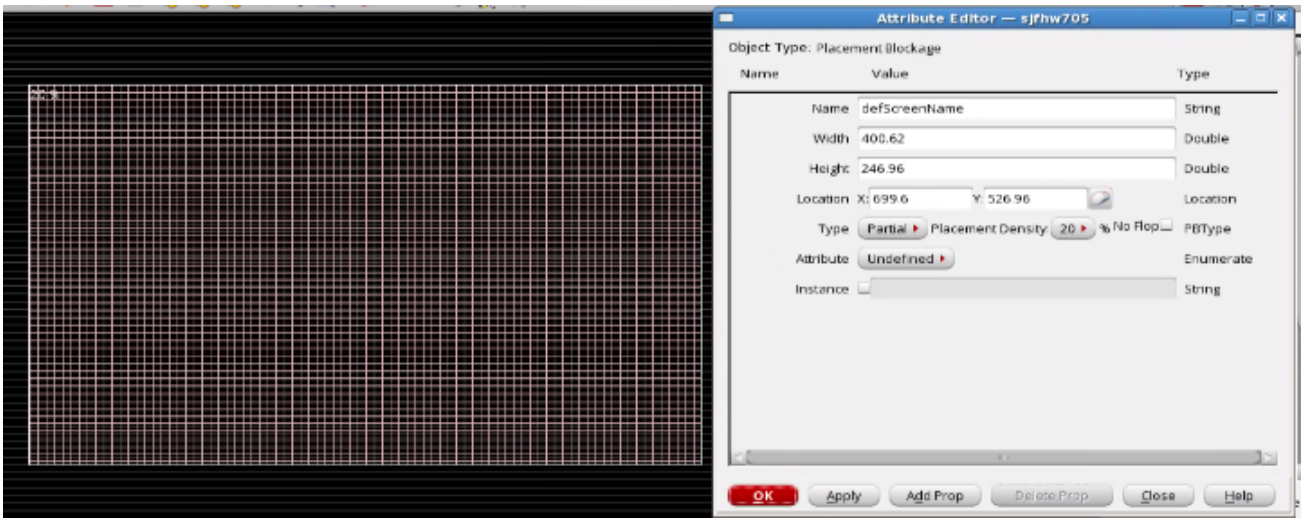
density	Specifies the maximum standard cell placement density percentage allowed in the area. Valid values are in increments of 5: 100, 95, 90, 85, 80, 75, 70, 65, 60, 55, 50, 45, 40, 35, 30, 25, 20, 15, 10, 5, 0. For example, setting a density percentage of 75 percent means that up to 75 percent of the defined density area will be used for placement. **Note:** If you enter any number that is not valid, the percentage defaults to the nearest valid value. *Maximum*: 100 *Minimum*: 0 *Data_type*: float, required
-help	Outputs a brief description that includes the type and default information for each `createDensityArea` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createDensityArea`
box	Specifies the box in the coordinates of the density area. • *llx*: Specifies the lower left x coordinate of the density area. • *lly*: Specifies the lower left y coordinate of the density area. • *urx*: Specifies the upper right x coordinate of the density area • *ury*: Specifies the upper right y coordinate of the density area. *Data_type*: box, required
-name *obj_name*	Specifies the name of the density screen area. *Data_type*: string, optional

Example

The following command creates a density screen area with placement density of 20%:

```
createDensityArea 699.6 526.96 1100.22 773.92 20
```

Before placement:



After placement:

createExclusiveGroups

```
createExclusiveGroups
[-help]
[group_name]
[-gap float]
[-min_gap float]
[-exclusiveGroups string | -mutuallyExclusiveGroups string]
```

Creates exclusive regions. Exclusive regions specified for a particular group cannot be placed/overlapped with it but they can overlap on each other/ any other region in the core area.

Sample Script

Following is a sample script to create exclusive groups:

```
createInstGroup $group_name
addInstToInstGroup $group_name {insts}
createInstGroup $group_name1
addInstToInstGroup $group_name1 {insts}
createExclusiveGroups $group_name -exclusiveGroups {$groups_name1}
```

Parameters

`-exclusiveGroups string`	Specifies the groups/regions that cannot be placed/overlapped with the specified group name. For Example: If regions B,C,D are defined as exclusive regions to A. Instances from B,C,D can never be placed on A. Other regions which are not defined exclusive to region A can be placed or overlapped with region A. *Data_type*: string, optional
`-gap float`	Specifies the value of the gap, in microns, that is maintained among exclusive groups. *Default*: 5 (microns) *Data_type*: float, optional
`group_name`	Specifies the name of the created group. *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `createExclusiveGroups` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createExclusiveGroups`
`-min_gap float`	Specifies the value of the minimum gap, in microns, that is maintained among exclusive groups. *Data_type*: float, optional
`-mutuallyExclusiveGroups string`	Specifies the groups which need to be excluded with each other. You can independently use this option to specify and create multiple mutually exclusive groups. **Note:** If a group has already been defined as an exclusive groups, then a second setting for this group using the `createExclusiveGroups` command will give display an error that suggests you to reset the exclusive groups attributes to default value. If you want to create mutually exclusive groups, then reset the exclusive groups attributes using the `deleteExclusiveGroups` command and then create the mutually exclusive groups using the `createExclusiveGroups -mutuallyExclusiveGroups` command. *Data_type*: string, optional

Examples

- The following commands define `gr_300` as an exclusive region to gr_200:

```
createInstGroup gr_200
addInstToInstGroup gr_200 DTMF_INST/TDSP_CORE_INST/EXECUTE_INST/acc_reg*
createInstGroup gr_300
addInstToInstGroup gr_300 DTMF_INST/TDSP_CORE_INST/EXECUTE_INST/top_reg_*
createExclusiveGroups gr_200 -exclusiveGroups gr_300
```

- The following commands defines instance groups A, B, C to be mutually exclusive groups with a space of 10 microns between each other.

```
createExclusiveGroups -mutuallyExclusiveGroups {A B C} -gap 10
```

Related Information

- `deleteExclusiveGroups`

- `addInstToInstGroup`
- Floorplanning the Design chapter in the *Innovus User Guide*

createFence

```
createFence
[-help]
obj_name
box
[-floating]
```

Creates a fence for a module or a group. Use this command after importing the design. To delete fences, use the `unplaceGuide` command.

Parameters

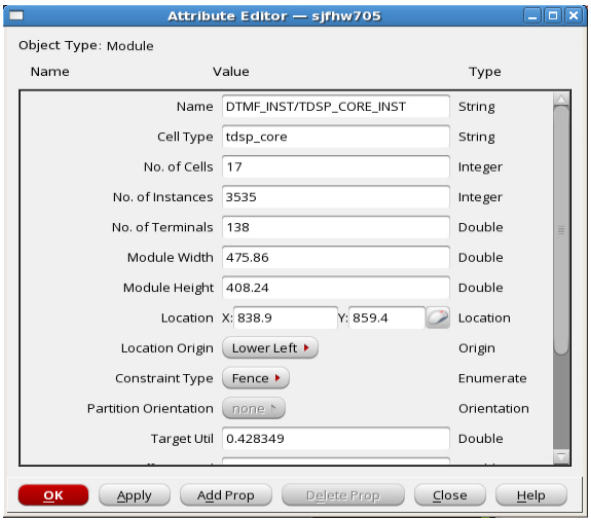
box	Specifies the constraint box of the box. • *llx*: Specifies the lower left x coordinate of the fence area. • *lly*: Specifies the lower left y coordinate of the fence area. • *urx*: Specifies the upper right x coordinate of the fence area. • *ury*: Specifies the upper right y coordinate of the fence area. *Data_type*: box, required
-floating	Creates a floating fence. The floating region/fence constraint allows the entire region/fence to move as a cluster across the core area. *Data_type*: bool, optional
-help	Outputs a brief description that includes the type and default information for each `createFence` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createFence`
obj_name	Specifies the name of the module or group to be fenced. *Data_type*: string, required

Example

The following command places the module guide of DTMF_INST/TDSP_CORE_INST in the floorplan view and changes its status to Fence:

```
createFence DTMF_INST/TDSP_CORE_INST 838.9 859.4 1314.76 1267.64
```

Before placement (Floorplan view):



After placement (Physical view) :

createGuide

```
createGuide
[-help]
obj_name
box
```

Creates a guide for a module or a group. Use this command after importing the design.

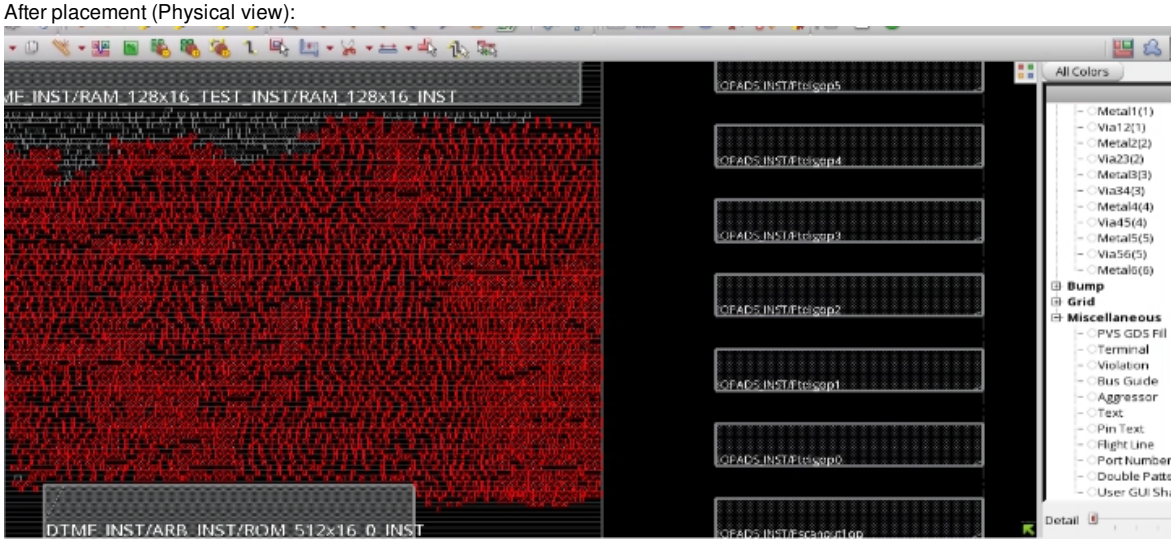
Parameters

`-help`	Outputs a brief description that includes the type and default information for each `createGuide` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createGuide`
obj_name	Specifies the name of the module or group to be guided. *Data_type*: string, required
box	Specifies the constraints of the box. • *llx*: Specifies the lower left x coordinate of the guide area. • *lly*: Specifies the lower left y coordinate of the guide area. • *urx*: Specifies the upper right x coordinate of the guide area. • *ury*: Specifies the upper right y coordinate of the guide area. *Data_type*: box, required

Examples

- The following command creates a guide for module of DTMF_INST/TDSP_CORE_INST:
  ```
  createGuide DTMF_INST/TDSP_CORE_INST 731.28 542.08 1105.5 829.36
  ```
  Before placement (Floorplan view) :

  After placement (Physical view):



- The following command creates a guide for group adder1:
  ```
  createGuide adder1 834.2000 1012.0000 2498.4000 3087.0000
  ```

Related Information

createInstGroup

```
createInstGroup
[-help]
group_name
[-isPhyHier]
[-guide box | -region box | -fence box | -softGuide ]
[[-ar num] -density num ]
[-softGuide ]
[-floating | -softGuide ]
[-floating | -guide box ]
```

Creates a new instance group, even outside the core boundary. Use this command after importing the design.

Note: Instance groups are used to create a new logical hierarchy unit, and normally all power domains will associate with an instance group which always have a constraint fence. The constraint fence means standard cell belonging to this group cannot be placed outside and only standard cell belong to this group can be placed inside. Cadence recommends that this physical-logical coherence should not be violated. The coherence requirement does not only apply for instance groups, but also pertains to all hinsts and instance groups as long as they have constraint fence.
In other words, if fence A belongs to fence B in logical, then fence A must be placed inside fence B.

Parameters

`-ar num`	Specifies the aspect ratio. If this is not specified, 1 is the default. *Data_type*: float, optional
`-density num`	Specifies a placement density percentage. Use the decimal format, where 0.75 is for 75% density. *Data_type*: float, optional
`-fence box`	Specifies the coordinates of the box (*x1 y1 x2 y2*) for a *fence*. • `x1`: Specifies the lower left x coordinate of the box. • `y1`: Specifies the lower left y coordinate of the box. • `x2`: Specifies the upper right x coordinate of the box. • `y2`: Specifies the upper right y coordinate of the box. **Note**: Since a fence should not cross multiple power domains, the `createInstGroup` command should only be used to group objects in the same power domain (otherwise the design may become unplaceable). *Data_type*: box, optional
`-floating`	Creates a floating instance group. **Note:** It does not support rectilinear shapes. **Note:** You can use the `-floating` parameter with the `-fence` or `-region` parameters only. *Data_type*: bool, optional

group_name	Specifies the name of the created group. A group is a user-defined group name and is created to contain hierarchical instances, instances (leaf instances), or other groups.
	Note: In the nested partitions scenario, to add a module to be within a module, you must include the hinst name of the module in which you want the new module to be in, within the group name.
	For example,
	`createInstGroup i_a/bc`
	`addInstToInstGroup i_a/bc i_a/b`
	`addInstToInstGroup i_a/bc i_a/c`
	Note: Incorrect groupings can cause violations.
	Data_type: string, required

`-guide box`	

	Specifies the coordinates of the box (*x1 y1 x2 y2*) for a *guide*. • `x1`: Specifies the lower left x coordinate of the box. • `y1`: Specifies the lower left y coordinate of the box. • `x2`: Specifies the upper right x coordinate of the box. • `y2`: Specifies the upper right y coordinate of the box. *Data_type*: box, optional
`-help`	Outputs a brief description that includes the type and default information for each `createInstGroup` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createInstGroup`
`-isPhyHier`	Specifies that the created group is a physical hierarchy. By default, the created group is not saved back to the netlist. *Data_type*: bool, optional
`-region` *box*	Specifies the coordinates of the box (*x1 y1 x2 y2*) for a *region*. • `x1`: Specifies the lower left x coordinate of the box. • `y1`: Specifies the lower left y coordinate of the box. • `x2`: Specifies the upper right x coordinate of the box. • `y2`: Specifies the upper right y coordinate of the box. **Note**: Since a fence should not cross multiple power domains, the `createInstGroup` command should only be used to group objects in the same power domain (otherwise the design may become unplaceable). *Data_type*: box, optional
`-softGuide`	Specifies that the created group is a soft guide constraint. *Data_type*: bool, required

Examples

- The following command creates group adder1:
  ```
  createInstGroup adder1
  ```
- The following command creates group gusher_4 and its placement guide at the above area location:
  ```
  createInstGroup gusher_4 -guide 2345.3 9962.1 4930.0 18244.8
  ```
- The following command creates group adder2 with 80% of the area occupied by the instance area with an aspect ratio of 2:
  ```
  createInstGroup adder2 -density .8 -AR 2
  ```

createIoRow

```
createIoRow
[-help]
{-site site_name [{-side {N | W | S | E}
[-rowMargin value]
[-beginOffset value]
[-endOffset value | -length len | -nrSites nr] } |
{-corner {BL | BR | TR | TL} [-xOffset value] [-yOffset value]}}]
[-orientation {R0 | R90 | R180 | R270}]
[-name row_name]} | {-deriveByCells} | {-deriveBySelection}
```

Creates new I/O rows and edits the existing I/O rows. You can use this command in the floorplanning stage.

Note: Before creating I/O rows for I/O row based pad placement, you need to set the I/O row flag using the `setIoFlowFlag` command.

Parameters

`-beginOffset value`	Specifies the starting location of the I/O row from the die edge. • For a horizontal row, this value is the lower X value. • For a vertical row, this value is the lower Y value. *Default*: 0, starting from the die edge. *Data_type*: float, optional
`-corner {BL | BR | TR | TL}`	
	Specifies the location of the corner cell. This can be: • `BL`: Bottom Left • `BR`: Bottom Right • `TR`: Top Right • `TL`: Top Left *Default*: `BL` *Data_type*: string, optional
`-deriveByCells`	Creates an I/O row for all the I/O cells in the design. *Data_type*: bool, required
`-deriveBySelection`	Creates an I/O row only for the selected I/O cells. **Note:** When you specify this parameter, some I/O rows may overlap depending on the I/O cell distribution. *Data_type*: bool, required
`-endOffset value`	Specifies the end location of the I/O row from the die edge. • For a horizontal row, this value is the higher X value. • For a vertical row, this value is the higher Y value. *Default*: 0, ending from the die edge. *Data_type*: float, optional
`-help`	Outputs a brief description that includes type and default information for each `createIoRow` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createIoRow.`
`-length len`	Specifies the length of the row, in µmeters, starting from the die edge or `-beginOffset value`. *Data_type*: float, optional
`-name row_name`	Specifies the name of the I/O row to be created. *Data_type*: string, optional

`-nrSites` *nr*	Specifies the number of sites to define the length of the row. **Note:** You can either specify `-endOffset` or `-length` or `-nrSites` each time you run the `createIoRow` command. *Data_type*: int, optional
`-orientation {R0 | R90 | R180 | R270}`	
	Specifies the orientation of the created row. If you do not specify this parameter, the default orientation for each side starting from the row on the south side is R0, rotate R90 for the next side, and so on... as follows: • R0 - South West • R90 - South East • R180 - North East • R270 - North West The default order of orientation is South, East, North, and West. *Data_type*: string, optional
`-rowMargin` *value*	Specifies the distance, in µmeters, from the row edge to the die edge. The row edge is `top' for a North side row, `bottom' for a South side row, `left' for a West side row, and `right' for an East side row. *Data_type*: float, optional
`-side {N | W | S | E}`	Specifies the side on which the row is to be created. If you do not specify the side, by default, one row is created on all sides (South, East, North, and West). *Data_type*: string, optional
`-site` *site_name*	Specifies the name of the site defined in the LEF library. *Data_type*: string, required
`-xOffset` *value*	Specifies the distance, in µmeters, from the left or right edge of the corner row to the die edge. *Data_type*: float, optional
`-yOffset` *value*	Specifies the distance, in µmeters, from the top or bottom edge of the corner row to the die edge. *Data_type*: float, optional

Example

- The following command creates I/O rows based on the existing pad placement.
  ```
  createIoRow -deriveByCells
  ```
- The following command creates I/O row at north side with offset 30 from left side, offset 20 from right side and row margin 15 from top side.
  ```
  createIoRow -name IO_ROW_N -beginOffset 30 -endOffset 20  -rowMargin 15 -side N -site IO -orientation R180
  ```
- The following command creates I/O row at bottom left corner to place corner IO with offset 10 in x and y direction.
  ```
  createIoRow -name IO_ROW_BL  -xOffset  10  -yOffset  10  -corner BL -site corner -orientation R0
  ```

createLogicHierarchy

```
createLogicHierarchy
[-help]
-cell string
[-commit]
-newHinst string
[-objects string]
[-selected]
```

Creates a new logical hierarchy for the specified hierarchical instances. The `createLogicHierarchy` command changes the netlist, CPF, SDC, Scan DEF, and floorplan constraints for the newly created hierarchy.

Parameters

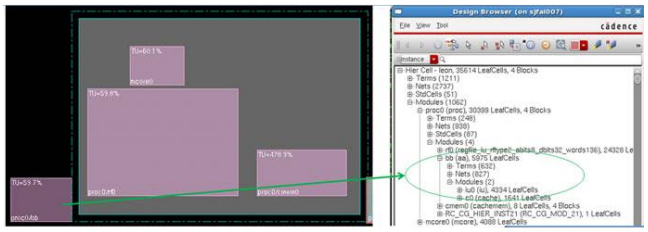
`-help`	Outputs a brief description that includes the type and default information for each `createLogicHierarchy` parameter. For detailed description of the command and all its parameters, use the man command: `man createLogicHierarchy`.
`-cell string`	Specifies the new cell name. *Data_type*: string, optional
`-commit`	Specifies the commit group result. *Data_type*: bool, optional
`-newHinst string`	Specifies the new hier inst name. *Data_type*: string, required
`-objects string`	Specifies the list of hinst and/or instance groups. *Data_type*: string, optional
`-selected`	Specifies that grouping is done for the current selected hinsts or instant groups. *Data_type*: bool, optional

Examples

- After using the following command, you can create a new Hinst name `proc0/bb` whose cell name is `aa` and add module `proc0/c0` and `proc0/iu0` to Hinst `proc0/bb`.

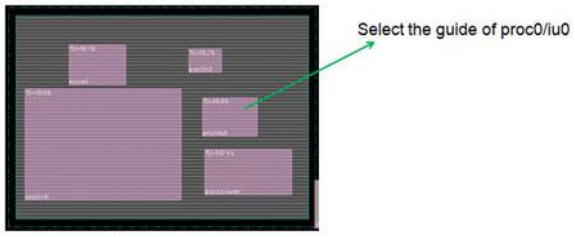
  ```
  createLogicHierarchy -commit -cell aa -newHinst proc0/bb -objects {proc0/c0 proc0/iu0}
  ```

  
  The module `proc0/c0` and `proc0/iu0` will be moved to group `proc0/bb`.

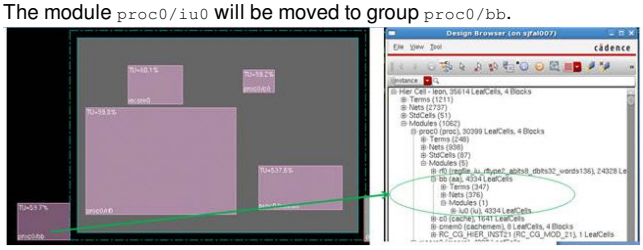
  


- After using the following command, you can create a new Hinst name `proc0/bb` whose cell name is `aa` and add selected module (it is `proc0/iu0` in this case) to Hinst `proc0/bb`.

```
createLogicHierarchy -commit -cell aa -newHinst proc0/bb -selected
```



The module `proc0/iu0` will be moved to group `proc0/bb`.



Note: It will not create group result without `-commit` option of `createLogicHierarchy` command.
Without the `-commit` option, the netlist of the design is not changed.

Related Information

  - Logical Hierarchy Manipulation

createPGPin

```
createPGPin
[-help]
{-onDie {-selected | -net netName}
[-width float]
[-length float]} |
{pgPinName [-net netName]
[-geom layerName llx lly urx ury]}
[-dir {undefined | input | output}]
```

Creates a power/ground pin as per the specified coordinates of the physical shape. You can use this command to create a power/ground pin without having to first create a power stripe with the `addStripe` command.

If the `-geom` parameter is not specified, only the logical pin is created.
If the `-geom` parameter is specified, the physical pin is also created.

If a logical power/ground pin exists before this command is run, the net name will be ignored if it is specified.
If a logical power/ground pin does not exist before this command is run:

- If a net has been specified with the -net parameter, the power/ground pin will be created and attached to the net specified.
- If a net name has not been specified, the net name is assumed to be the same as the pin name. In this case, the power/ground pin will be created and attached to that nets.

Parameters

`-dir {undefined | input | output}`	
	Specifies the direction of the power/ground pin. You can specify one of the following: • `undefined`: Specifies that the direction of the pin is not defined. • `input`: Specifies that the direction of the pin is input. • `output`: Specifies that the direction of the pin is output. *Data_type:* enum, optional
`-geom layerName llx lly urx ury`	
	Specifies the geometry of the physical pin. • *`layerName`*: Specifies the layer on which the power/ground pin will be created. The *`layerId`* can range from 1 to n, where, the maximum value for n is the top most routing layer. **Note:** Layers can also be specified using layer names (for example, Metal1, Metal2, Metal3) or the LEF layer names. • *`llx`*: Specifies the lower-left x coordinate, in microns, of the power/ground pin. • *`lly`*: Specifies the lower-left y coordinate, in microns, of the power/ground pin. • *`urx`*: Specifies the upper-right x coordinate, in microns, of the power/ground pin. • *`ury`*: Specifies the upper-right y coordinate, in microns, of the power/ground pin. *Data_type:* string, optional
`-help`	Outputs a brief description that includes the type and default information for each *`createPGPin`* parameter. For a detailed description of the command and all of its parameters, use the man command: `man createPGPin`
`-length float`	Specifies the length of the power/ground pin. *Default*: Same as the width *Data_type:* float, optional
`-net netName`	Specifies the name of the net to which the power/ground pin will be attached. *Data_type:* string, optional
`-onDie`	Creates power/ground pin on the die. *Data_type:* bool, optional
`pgPinName`	Specifies the name of the power/ground pin. *Data_type:* string, optional
`-selected`	Creates power/ground pin on the die, for all selected stripes. *Data_type:* bool, optional
`-width float`	Specifies the width of the power/ground pin. *Default*: width of the stripe. *Data_type:* float, optional

Examples

- This example is for the case where a logical pin name has not been defined prior to running the command and a net name has been specified.
  The following command creates a power/ground pin named pgpin_A on layer Metal2 and attaches the pin to the net net_A. The pin coordinates are 7 (llx), 3 (lly), 17 (urx), and 23 (ury).
  ```
  createPGPin -geom Metal2 7 3 17 23 -net net_A pgpin_A
  ```
- This example is for the case where a logical pin name has not been defined prior to running the command and a net name has not been specified.
  The following command creates a power/ground pin named pgpin_B on layer Metal3 and attaches the pin to the net pgpin_B. The pin coordinates are 7 (llx), 3 (lly), 17 (urx), and 23 (ury). As the net name was not specified, the net name is assumed to be the same as the pin name.

```
createPGPin -geom Metal3 7 3 17 23 pgpin_B
```

- This example is for the case where a logical pin name has already been defined prior to running the command.
  The following command creates a power/ground pin named pgpin_C on layer Metal5. The pin coordinates are 7 (llx), 3 (lly), 17 (urx), and 23 (ury). In this case, the logical pin name was already defined prior to running the command, and so a net name is not required. Even if a net name were specified, it would have been ignored.
  ```
  createPGPin -geom Metal5 7 3 17 23 pgpin_C
  ```
- This example is for the case where the net name is not specified and the -geom parameter has not been specified.
  The following command creates a logical pin names pgpin_D. The net name is assumed to be the same as the pin name and no physical pin is created.
  ```
  createPGPin pgpin_D
  ```
- This example is for the case where the pin is created on the die attached to net vdd with a width of 2 and a length of 3.
  ```
  createPGPin -onDie -net vdd -width 2 -length 3
  ```

Related Information

- addStripe
- deletePGPin

  - Create P/G Pin

createPhysicalPin

```
createPhysicalPin
[-help]
pinName
[-allowOutsideBoundary]
[-net netName]
[-samePort]
{{ -layer layerName {-rect {x1 y1 x2 y2} | -polygon {x1 y1 x2 y2 ... xn yn}}}}
```

Adds a new physical pin-shape to a top-level term (DEF PIN). You can use this command to add more PG (power/ground) pin-shapes to an existing PG term. It will also create a new PG term if there is not already a PG term.

Note: It can add shapes to top-level signal terms, but this is not recommended. Multiple shapes for a signal term may cause flow problems (the router will not connect the different pin shapes, etc.) and should only be done with expert knowledge of the flow implications. It will not create a new signal term (You must use ECO commands to add a new signal term).

Parameters

`-allowOutsideBoundary`	Do not check whether the specified rectangle is inside the design boundary. *Data_type:* bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `createPhysicalPin` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createPhysicalPin`
`-layer layerName`	Specifies the LEF (or OA) layer name, or the routing layer index value. For example, 1 for first routing layer, 2 for second routing layer. *Data_type:* string, optional
`-net netName`	Specifies the name of the net. This is ignored if a top-level term named *pinName* already exists. *Data_type:* string, optional
pinName	Specifies the name of the top-level term (DEF PIN) to add shapes to. If it does not exist, then `-net netName` is used to find a top-level term instead. If *netName* does not already have a top-level term, and it is a PG net, then a new term named *pinName* will be created for *netName*. *Data_type:* string, required
`-polygon {x1 y1 x2 y2 ... xn yn}`	Specifies the coordinates of each vertex of the shape. *Data_type:* (point)+, optional
`-rect {x1 y1 x2 y2}`	Specifies the coordinates of the rectangular shape. • *x1* Specifies the lower-left x coordinate, in microns, of the physical pin. • *y1*: Specifies the lower-left y coordinate, in microns, of the physical pin. • *x2*: Specifies the upper-right x coordinate, in microns, of the physical pin. • *y2*: Specifies the upper-right y coordinate, in microns, of the physical pin. *Data_type:* rect, optional
`-samePort`	Specifies that the physical pin shapes will be added to the first DEF PORT. If this parameter is not specified, each pin shape is created on a separate DEF port. Normally each PG shape should be on a separate port so each one is connected separately to the PG mesh at the next level up. *Data_type:* bool, optional

Examples

- The following command adds a physical pin-shape to the top-level term named VSS (e.g. DEF PIN named VSS).
  ```
  createPhysicalPin VSS -layer Metal2 -rect {7 3 17 23}
  ```

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

createPlaceBlockage

```
createPlaceBlockage
[-help]
[-pushdown]
{{[-box {x1 y1 x2 y2} | -polygon {{x1 y1} {x2 y2}...}
  | -boxList {{x1 y1} {x2 y2}...}
  | -allPartition | -allMacro ]
  [-inst inst_name | -hinst hinst_name] }
  [-name place_blockage_name | -prefixOn ]
  [{-type {hard soft partial macroOnly}}
  [-density value] [-excludeFlops ]]
  [-noCutByCore]
  [-snapToSite] }
[ {-inst inst_name | -hinst hinst_name | -allPartition | -allMacro }
  [-cover ]
  [-innerRingBySide {x1 y1 x2 y2} | -innerRingByEdge {edge1 edge2 edge3 ...}]
  [-outerRingBySide {x1 y1 x2 y2} | -outerRingByEdge {edge1 edge2 edge3 ...}] ]
```

Creates cell placement blockages that can be placed. A placement blockage is a floorplan object used to block standard cell placements. Use this command after importing the design.

Parameters

`-allMacro`	For each macro creates a placement blockage covering that macro. *Data_type*: bool, optional
`-allPartition`	For each partition creates a placement blockage covering that partition. *Data_type*: bool, optional
`-box {x1 y1 x2 y2}`	Specifies the coordinates of the blockage area. • `x1`: Specifies the lower left x coordinate of the obstruction area. • `y1`: Specifies the lower left y coordinate of the obstruction area. • `x2`: Specifies the upper right x coordinate of the obstruction area. • `y2`: Specifies the upper right y coordinate of the obstruction area. **Note:** You can enclose the coordinate values (*x1...y2*) in double-quotes, curly-braces, [list ...], or just separate them with spaces. *Data_type*: box optional
`-boxList {{x1 y1 x2 y2} ...}`	Specifies the coordinates of a list of blockage areas. *Data_type*: box_list, optional
`-cover`	By default the parameters (`-outerRingByEdge` and `-outerRingBySide`) used to create placement blockages around the outside of the object, create toroidal placement blockages. The `-cover` parameter combined with these parameters creates a solid placement blockage, otherwise the `-cover` parameter does nothing. *Data_type*: bool, optional
`-density value`	Specifies the maximum density allowed for partial or soft blockages. The value is in steps of 5 between 5 and 100, with units of percent. For example, a partial placement value of 75 means that up to 75 percent placement density is allowed in the area. **Note**: The `-density` parameter can only be used in combination with the `-type partial` or `-type soft` parameter. *Minimum*: 5 *Maximum*: 100 *Data_type*: inst, optional

`-excludeFlops`	Specifies that flops and latches will not be placed in the blockage during global placement. **Note:** The `-excludeFlops` parameter can only be used with the `-type partial` and `-density` parameters. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `createPlaceBlockage` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createPlaceBlockage`
`-hinst` *hinst_name*	Specifies the name of the hierarchical instance on which the placement blockage is to be applied. *Data_type*: (hInst), optional
`-innerRingByEdge {`*edge1 edge2 edge3 ...*`}`	
	Creates a hollow ring of placement blockage around the inside of the object(s) specified. *edgeN* is the width in microns of the blockage created inside the Nth edge. *edge1* is the vertical edge starting at the left corner of the leftmost edge with the lowest y coordinate as placed, and proceeding clockwise through the other edges. **Note** : • The `-inst` , `-hinst` , `-allMacro`, or `-allPartition` parameters must be specified with this parameter. • There must be an *edgeN* specified for every edge of the object(s). • Enclose the *edgeN*s in double-quotes, curly braces, or [list ...]. *Data_type*: string, optional
`-innerRingBySide {`*x1 y1 x2 y2*`}`	
	Creates a hollow ring of placement blockage around the inside of the object(s) specified. *bottom* is the width in microns of the blockage created on bottom edges, etc. **Note**: • The `-inst`, `-hinst`, `-allMacros`, or `-allPartition` parameters must be specified with this parameter. • `The -innerRingBySide` parameter can be used with rectilinear objects. • Enclose the *bottom...left* values in double-quotes, curly braces, or [list ...] *Data_type*: box, optional
`-inst` *inst_name*	Specifies the name of the instance on which the placement blockage is to be applied. *Data_type*: (inst), optional
`-` `name` *place_blockage_name*	Specifies the name of the placement blockage. **Note:** Placement blockage names need not be unique. **Note:** If neither `-name` nor `-prefixOn` parameters are specified, then the created place blockage is named `defScreenName`. *Data_type*: string, optional
`-noCutByCore`	Specifies that placement blockages should not be truncated at the core boundary. Placement blockage will always be truncated at the die boundary. *Data_type*: bool, optional
`-prefixOn`	Specifies that the placement blockages should be named with a prefix defined by `getFPlanMode -defaultBlockageNamePrefix` attribute. Names are of the form `prefix_<int>` *Data_type*: bool, optional
`-outerRingByEdge {`*edge1 edge2 edge3 ...*`}`	

	Creates a hollow ring of placement blockage around the outside of the object(s) specified. *edgeN* is the width in microns of the placement blockage along the Nth edge. *edge1* is the vertical edge starting at the left corner of the leftmost edge with the lowest y coordinate as placed, and proceeding clockwise through the other edges. **Note**: • The `-inst`, `-hinst` , `-allMacros`, or `-allPartition` parameters must be specified with this parameter. • There must be an *edgeN* specified for every edge of the object(s). • By default, a toroid of blockage is created around the specified object(s). Use the `-cover` parameter to create a solid blockage over the objects with the specified additional halo of blockage. • Enclose the *edgeN*s in double-quotes, curly braces, or [list ...]. *Data_type*: string, optional
`-outerRingBySide {x1 y1 x2 y2}`	
	Creates a hollow ring of placement blockage around the outside of the object(s) specified. `bottom` is the width in microns of the placement blockage along the bottom edge(s) of object(s) specified, etc. **Note**: • The `-inst`, `-hinst`, or `-allPartition` parameters must be specified with this parameter. • The `-outerRingBySide` parameter can be used with rectilinear objects. • By default, a toroid of blockage is created around the specified object(s). Use the -cover parameter to create a solid blockage over the objects with the specified additional halo of blockage. • Enclose the *bottom...left* in double-quotes, curly braces, or [list ...]. *Data_type*: box, optional
`-polygon {{x1 y1} {x2 y2} ...}`	
	Specifies the polygon vertices of the blockage, in microns. *Data_type*: point_list, optional
`-pushdown`	Set pushdown attribute for blockages. A blockage with pushdown attribute is pushed down into the block from the top level of the design. **Note:** A normal routing blockage is just used to check for overlaps with routes. A placement blockage with pushdown attribute in Smart Hier flow is used to restrict boundary area for placement and assemble design does not bring it back. *Data_type*: bool, optional
`-snapToSite`	Snaps the newly created placement blockage to a row site. *Data_type*: bool, optional
`-type {hard | soft | partial | macroOnly}`	

	Specifies the type of blockage to be created. • `hard`: Neither standard cell instances nor macros may be placed in the blockage. This is the default. • `soft`: Only buffers, inverters, isolation cells, clock gates, tie cells and level shifters are allowed to be placed inside the soft blockages. All other cells are placed outside the soft placement blockage. You can optionally specify cells and instances that are allowed or forbidden to be placed inside soft blockages by using the `specifySelectiveBlkgGate` or `unspecifySelectiveBlkgGate` commands. • `partial`: In conjunction with the `-density` parameter alone or with the `-density` and `-excludeFlops` parameters together, creates a placement blockage that has a maximum density as specified (and sometimes excludes flops and latches too). • `macro_only`: Enables the `proto_design` command to keep macros out of the placement blockage; however, it enables standard cells to be placed inside the box as if no blockage is present. Macro-Only blockage is represented as "0" percent partial blockage in floorplan file, DEF file, and in Innovus DB. *Default*: `hard` **Note**: Alternatively, you can create different types of placement blockages using the *Set Placement Blockage Options* form or after creating the placement blockage, you can double-click on the object in the design display area to open the *Attribute Editor* and select from four blockage types. *Data_type*: enum, optional

Example

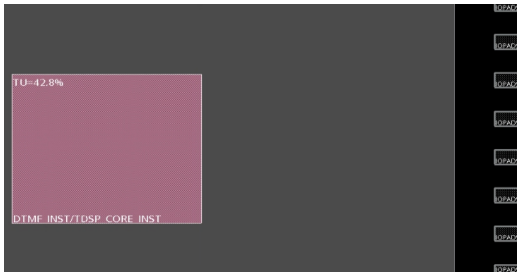
- The following command creates a soft blockage, softBlockage2 in the design area:
  ```
  createPlaceBlockage -type soft -box { { 3442.3600 3739.2000 3511.6500 5716.6300 } } -name softBlockage2
  ```

- The following command creates a hard blockage covers the block instance of DTMF_INST/PLLCLK_INST:
  ```
  createPlaceBlockage -type hard -inst DTMF_INST/PLLCLK_INST -cover
  ```
  Before:

  
  After:

- The following command creates a hard blockage for hierarchical instance (Module) of DTMF_INST/TDSP_CORE_INST:
  ```
  createPlaceBlockage -type hard -hinst DTMF_INST/TDSP_CORE_INST -cover
  ```
  Before:

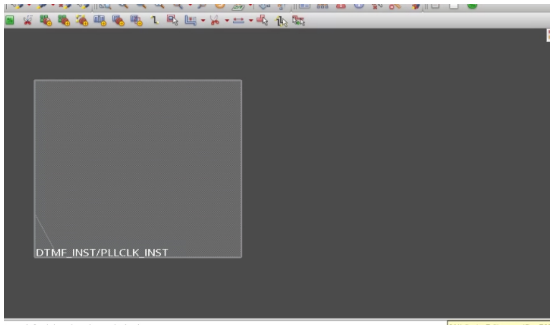
  
  After:

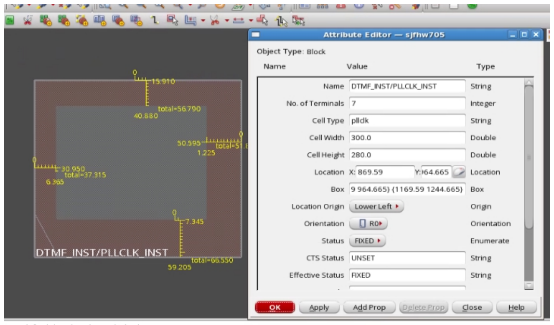
- The following command creates a hollow ring of placement blockage inside of the object:

```
createPlaceBlockage -type hard -inst DTMF_INST/PLLCLK_INST -innerRingByEdge {30 40 50 60}
```

Before:

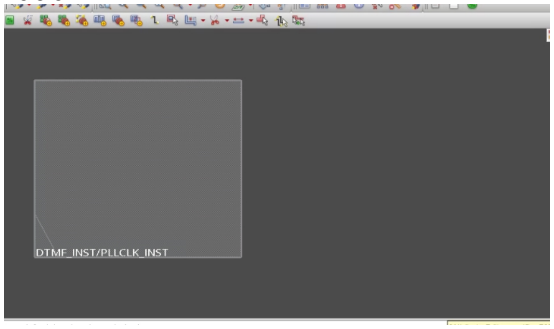


After:

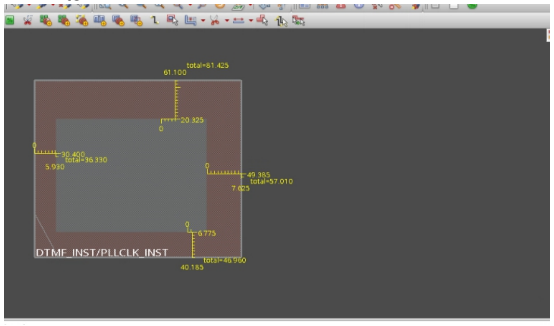


```
createPlaceBlockage -type hard -inst DTMF_INST/PLLCLK_INST -innerRingBySide {30 40 50 60}
```

Before:

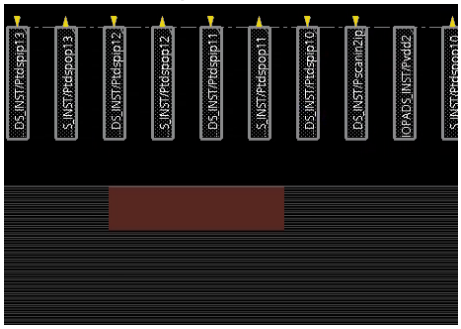


After:

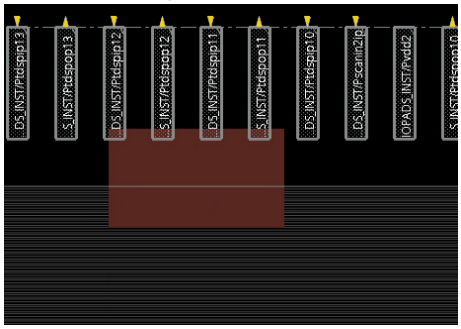


- The following command shows the functionality of the option `noCutByCore`:

```
createPlaceBlockage -box {952 1690 1291 1899}
```



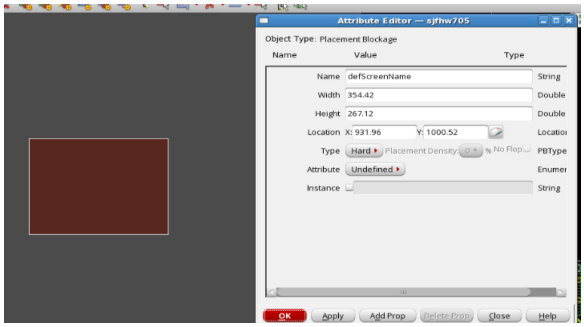
```
createPlaceBlockage -box {952 1690 1291 1899} -noCutByCore
```



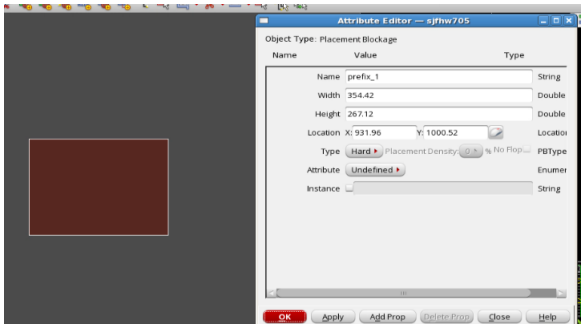
- The following command shows the functionality of the option prefixOn:

setFPlanMode -defaultBlockageNamePrefix prefix

createPlaceBlockage -box {932 1004 1286 1265}



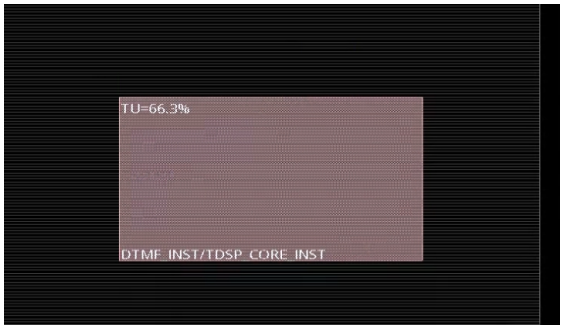
createPlaceBlockage -box {932 1004 1286 1265} -prefixOn

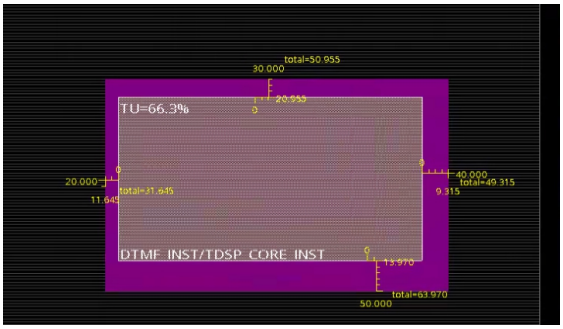


- The following command creates a hollow ring of placement blockage outside of the object:

```
createPlaceBlockage -hinst DTMF_INST/TDSP_CORE_INST -innerRingByEdge {20 30 40 50}
```

Before: After:





```
createPlaceBlockage -hinst DTMF_INST/TDSP_CORE_INST -innerRingBySide {20 30 40 50}
```

Before: After:

createRegion

```
createRegion
[-help]
obj_name
box
[-floating]
```

Creates a region for a module or a group. Use this command after importing the design. To delete regions, use unplaceGuide.

Parameters

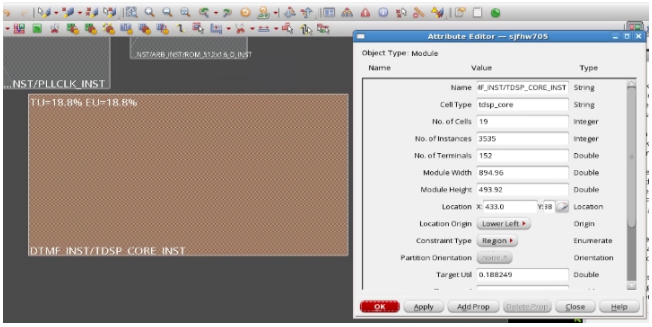
box	Specifies the constraint box in `llx lly urx ury`: • `llx`: Specifies the lower left x coordinate of the region area. • `lly`: Specifies the lower left y coordinate of the region area. • `urx`: Specifies the upper right x coordinate of the region area. • `ury`: Specifies the upper right y coordinate of the region area. *Data_type*: box, required
`-floating`	Creates a floating region. The floating region/fence constraint allows the entire region/fence to move as a cluster across the core area. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `createRegion` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createRegion`
`obj_name`	Specifies the name of the module or the group. *Data_type*: string required

Example

The following command creates a module guide in the floorplan view with status Region:

```
createRegion DTMF_INST/TDSP_CORE_INST 433.0 793.88 1327.96 1287.8
```

before placement (Floorplan view):



After placement (Physical view):

createRouteBlk

```
createRouteBlk
[-help]
[-cutLayer layerName | {layerNamelist ...} | all]
[-drcRegionLayer layerName| {layerNamelist ...} | all]
[-fills]
[-inst name]
[-layer layerName | {layerNamelist ...} | all]
[-mask integer]
[-noWrongWay]
[-pushdown]
[-trimMetalLayer layerName | {layerNamelist ...} | all]
[-name blk| -prefixOn]
{-box {x1 y1 x2 y2} | -cover | -polygon {{x1 y1} {x2 y2}...} | -boxList {{x1 y1} {x2 y2}...}}
[-exceptpgnet | -pgnetonly  | -partial integer]
[-spacing float | -designRuleWidth float]
```

Creates a routing blockage object. The object area prevents routing of specified metal layers, signal routes, and hierarchical instances in this area. Use this command during partition floorplanning.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `createRouteBlk` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createRouteBlk`

`-box {x1 y1 x2 y2}`	Specifies the coordinates of the blockage area.
	• *x1*: Specifies the lower left x coordinate of the blockage area.
	• *y1*: Specifies the lower left y coordinate of the blockage area.
	• *x2*: Specifies the upper right x coordinate of the blockage area.
	• *y2*: Specifies the upper right y coordinate of the blockage area.
	Data_type: box, required
	For example, the following command creates a routing blockage object on metal layers 1, 4, and 5:
	`createRouteBlk -box {0 0 100 100} -layer {metal1 metal4 metal5}`
	Note: You can also add variables to specify the blockage area. For example,
	`set box "0 0 100 100"`
	`createRouteBlk -box $box`

`-boxList {{x1 y1} {x2 y2}...}`	
	Specifies the coordinates of a list of blockage areas. *Data_type*: point_list, required
`-cover`	Specifies that a routing blockage of the same size as the specified block instance (`-inst name`) will be created on top of the instance. **Note:** The `-inst` parameter must be specified with this parameter. *Data_type*: bool, required
`-cutLayer layerName | {layerNamelist ...} | all`	

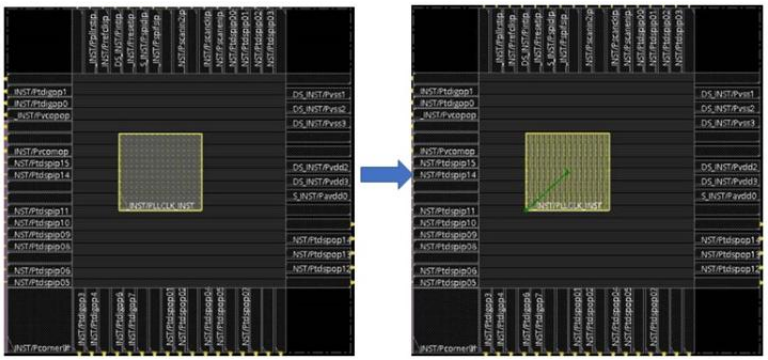
	Specifies the cut layer, list of cut layers, or all cut layers on which the routing blockage is to be applied. To specify cut layer between the first layer (e.g. metal1) and second layer (e.g. metal2), use the second layer name (e.g. metal2). For example, `-cutLayer metal2`. Similarly, if you want to create blockage on cut layer between the second layer (e.g. metal2) and third layer (e.g. metal3), use the third layer name (e.g. metal3). For example, `-cutlayer metal3`, and so on. **Note:** The values specified with this parameter will override any default blockage layers specified with the `setRouteBlkDefaultLayer` command. *Default*: If you do not specify this parameter, the Innovus software will check if any default blockage layers have been specified with the `setRouteBlkDefaultLayer` command. If yes, the layers specified with the `setRouteBlkDefaultLayer` command will be used. If no, the default is metal3 if the number of layers is greater than 3, or metal2 if the number of layers is less than or equal to 3. *Data_type*: list, optional
`-designRuleWidth` *`float`*	Specifies the effective width of the blockage for the purposes of spacing calculations. If you specify `-designRuleWidth`, you cannot specify `-spacing`. **Type:** The *`effectiveWidth`* is a real number greater than 0, in microns. *Data_type*: float, optional
`-drcRegionLayer` *`layerName`*`| {`*`layerNamelist ...`*`} | all`	
	Specifies the drc region layers, list of drc region layers, or all drc region layers on which the routing blockage is to be applied. *Data_type*: list, optional
`-exceptpgnet`	Specifies that the routing blockage is to be applied on a signal net routing and not on power or ground net routing. Use this option to block signal routing above or around a sensitive block to avoid noise from nearby signal nets but still allow power connections to go through the blockage. **Note:** Blocking the signal net routing helps in avoiding crosstalk or coupling caused by signal routes. *Data_type*: bool, optional
`-fills`	Specifies that the routing blockage is to be applied on metal fills. *Data_type*: bool, optional
`-inst` *`name`*	Specifies the name of the instance on which the routing blockage is to be applied. **Note:** When the `-cover` parameter is specified, the `-inst` parameter must also be specified. However, when the `-inst` parameter is specified then specifying the `-cover` option is optional. *Data_type*: string, optional
`-layer` *`layerName`* `|` {*`layerNamelist ...`*`} | all`	
	Specifies the layer, list of layers, or all layers on which the routing blockage is to be applied. **Note:** The values specified with this parameter will override any default blockage layers specified with the `setRouteBlkDefaultLayer` command. *Default*: If you do not specify this parameter, the Innovus will check if any default blockage layers have been specified with the `setRouteBlkDefaultLayer` command. If yes, the layers specified with the `setRouteBlkDefaultLayer` command will be used. If no, the default is wire3 if the number of layers is greater than 3, or wire2 if the number of layers is less than or equal to 3. **Note**: You must specify the *layerName* as a number or as a layer name defined in LEF. For example, *layerName* can be specified as 2 or metal2. *Data_type*: list, optional

`-mask integer`	Blocks routing layers with specified masks. Layers with other masks can still be routed through the blockage. **Note:** • The default value of the `-mask` parameter is 0. This implies that all the specified layers will be blocked. • If the `-mask` parameter is specified with an integer value greater than 0, then both layers with specified mask and uncolored layers are blocked. Example. If `-mask 1` is specified, it blocks mask 1 and uncolored routes. • If more than one layers are associated with a mask, the mask is applied to all of them. • If the `-mask` parameter is specified, the tool checks if the mask is suitable for all of the specified layers. If not, it displays an ERROR message and no blockages are created. The number of arguments specified with the –`mask` parameter must be same as the number of arguments specified with the `-layer`, `-cutLayer` and `-trimMetalLayer` parameters. • The `setNanoRouteMode` and `verify_drc` commands honor the `-mask` parameter. *Default*: 0 *Data_type*: int, optional
`-name blk`	Specifies the layer name of the route blockage. *Data_type*: string, optional
`-noWrongWay`	When this parameter is specified, wrong way routing is avoided in the region. Both router and verify_drc will report DRC if any jogs are present. *Data_type*: bool, optional
`-partial integer`	Specifies the density for partial routing blockages. It causes the global router to only use up to the specified percent of the routing resource on the layer in the blockage area, so the global router will see higher congestion and put fewer routes on that layer in the area. For example, `-partial 75` means only 75% of routing resource in a gcell is available for global routing, and this will affect the final demand/supply values in the congestion map after routing. It is an integer in the range 0 to 100. This can be useful if the router consistently creates too much congestion in a specific area. If you add a partial routing blockage in that area you can force the router to end up with less “real congestion” in that area. When there are overlapping partial routing blockages, the lowest density percentage of the blockages will be used in the overlapping region. For example, when a partial routing blockage with 75 percent density overlapping with another partial routing blockage with 50 percent density, the density of the overlapping region will be 50 percent. **Note:** You can attach a partial routing blockage to a block instance with `-inst` if the congestion is related to the boundary and pins of a specific block. **Note:** The `-designRuleWidth`, `-exceptpgnet`, `-pgnetonly`, and `-spacing` parameters are not allowed for partial routing blockages. *Minimum*: 0 *Maximum*: 100 *Data_type*: int, optional

`-pgnetonly`	Specifies that the routing blockage is to be applied only on power or ground net special routes and not on signal nets. This option affects only commands that create special routes,such as `addRing`, `addStripe`, or `sroute`, when they are used for PG nets. NanoRoute, which is used to connect tie-high or tie-low connections or to connect to secondary standard-cell power-pin connections, is also not affected by this option. Use this option during power planning to prevent power routes from getting too close to block edges and, as a result, blocking signal pin access or causing congestion in narrow channels. **Note:** This option cannot be used with `-exceptpgnet`. *Data_type*: bool, optional
`-prefixOn`	Specifies that the routing blockages should be named with a prefix. *Data_type*: bool, optional
`-polygon {{x1 y1} {x2 y2}...`	Specifies the polygon vertices of the blockage, in microns. **Note:** Although `createRouteBlk` can be be used to create triangular blockages, metal fill does not currently support triangular route blockages. *Data_type*: point_list, required
`-pushdown`	Set pushdown attribute for blockages. A blockage with pushdown attribute is pushed down into the block from the top level of the design. **Note:** A normal routing blockage is just used to check for overlaps with routes. A route blockage with pushdown attribute is treated as a real wire shape from above with full DRC checks. *Data_type*: bool, optional
`-spacing float`	Specifies the minimum spacing allowed between the blockage and any other routing shape. If you specify `-spacing`, you cannot specify `-deignRuleWidth`. **Type:** The float is a real number greater than or equal to 0, in microns. **Note:** When the blockage is of FILL type, the spacing property does not work. In that case, metal fill can still be abutted to the fill blockage. *Data_type*: float, optional
`-trimMetalLayer layerName | {layerNamelist ...} | all`	
	Specifies the trim metal layer, list of trim metal layers, or all trim metal layers on which the routing blockage is to be applied. For example, the following command command creates routing blockages in trim metal layers Metal1 and Metal2. `createRouteBlk -trimMetalLayer {metal1 metal2 …}` *Data_type*: list, optional

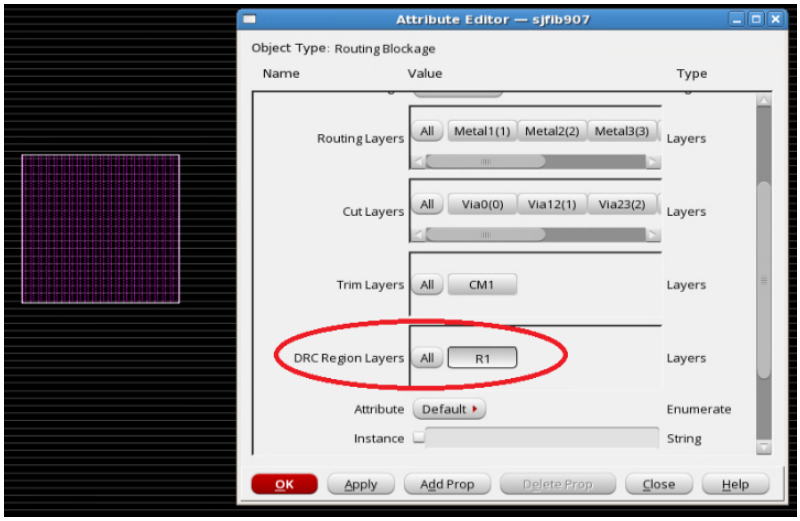
Example

- The following command creates a routing blockage object to block metal3 routing in this area:
  ```
  createRouteBlk -box {2353.8000 7123.000 2653.8000 8298.2000} -layer metal3
  ```
- The following command creates a routing blockage object on metal layers 1, 4, and 5:
  ```
  createRouteBlk -box {0 0 100 100} -layer {metal1 metal4 metal5}
  ```
- The following command creates a routing blockage object on metal layers 1, 4 and blocks the signal net routing:
  ```
  createRouteBlk -box {10 18 1782 2300} -layer {metal1 metal4} -exceptpgnet
  ```
- The following command creates a routing blockage object having polygon vertices (10, 10), (10, 15), (15, 15), (15, 20), (20, 20), (20, 10) on the metal layer 1:
  ```
  createRouteBlk -polygon {10 10 10 15 15 15 15 20 20 20 20 10} -layer metal1
  ```
- The following command creates a routing blockage on top of the the specified block instance that is of the same size the instance.
  ```
  createRouteBlk -inst DTMF_INST/PLLCLK_INST -cover
  ```



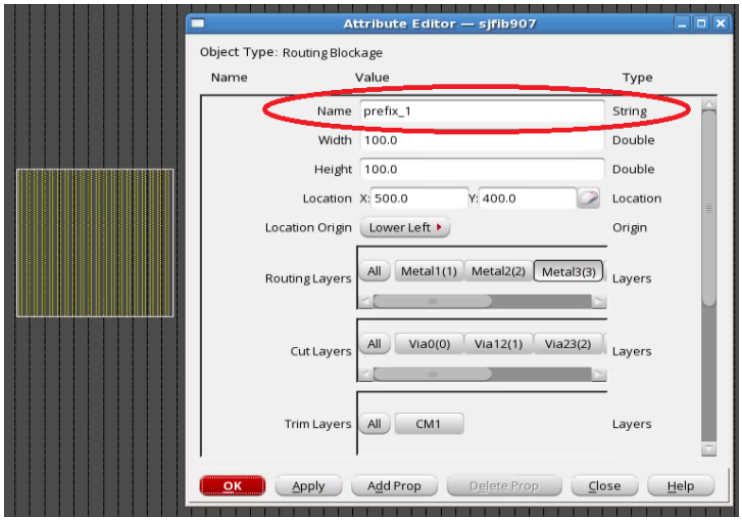
- The following command creates a routing blockage object on drc region layer:

```
createRouteBlk -box {500 400 600 500} -drcRegionLayer R1
```



- The following command creates a routing blockage object with a prefix name:
  set prefix name：`setFPlanMode -defaultBlockageNamePrefix prefix`

```
createRouteBlk -box {500 400 600 500} -prefixOn
```



- The following command creates a routing blockage on metal fills only:

```
createRouteBlk -box {500 400 600 500} -fills
```

- The following command creates a routing blockage on power or ground net special routes only and not on signal nets.

```
createRouteBlk -box {0 0 100 100} -pgnetonly
```

Related Information

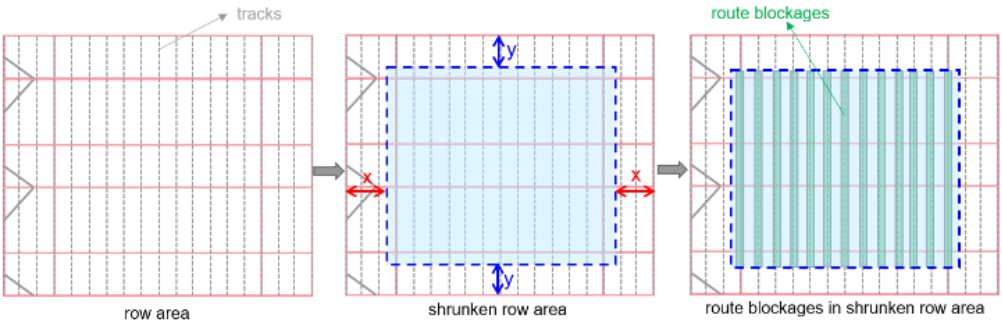
createRouteBlkAlongTrack

```
createRouteBlkAlongTrack
[-help]
-align_track string
[-consider_cells_as_macros string]
[-consider_macros_as_cells string]
[-edge_shrink {x y}]
-layer string
[-no_cut_row]
```

Creates routing blockages that are aligned to specified tracks which are in the shrunken row area. Use this command during partition floorplanning.



Note:

- Routing blockages are also created with align to the track which is near to the shrunken row area with less than half of layer width.
- Routing blockages honor rectilinear row area.

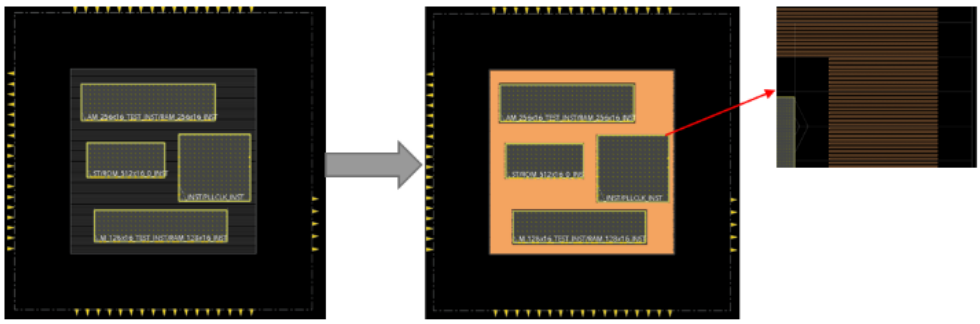
Parameters

`-align_track string`	Specifies the track layer to which the route blockages align to. *Data_type*: string, required
`-help`	Prints a brief description that includes the type and default information for each `createRouteBlkAlongTrack` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createRouteBlkAlongTrack`
`-consider_cells_as_macros string`	
	Specifies the names of the cells that are considered as macros. Blockages are not created over them. *Data_type*: string, optional
`-consider_macros_as_cells string`	
	Specifies the names of the cells that are considered as std cells. Blockages are created over them. *Data_type*: string, optional
`-edge_shrink {x y}`	Shrinks row area from the edge in X and Y direction. *Data_type*: point, optional
`-layer string`	Specifies the name of the layer on which the tool creates routing blockages for steam out. *Data_type*: string, required

`-no_cut_row`	Specifies whether the blockages to be added should be based on the no-cut row site area even if the row site area is not cut in the design. • Without the `-no_cut_row` parameter, the tool will create route blockages based on the current row area. So the rows for objects like insts, place blockages are expected to be cut out before running the `createRouteBlkAlongTrack` command to get expected results. • With the `-no_cut_row` parameter, the tool will identify the rows have not been cut before and will call the `cutRow` command to get a cut row shape during the action. The route blockage is created based on the cut row shape. The actual row shape will not be changed. • The `setFPlanMode -no_cut_row true` command has the same use with this option. Example: In the following illustration, the rows are not cut before. Now, without the `-no_cut_row` parameter, the tool will create a route blockage over the place blockage and the inst. With the `-no_cut_row` parameter, the tool will not create route blockage over them.  *Default:* false *Data_type*: bool, optional

Example

- The following command creates a routing blockage on layer M2. The route blockages align to track layer M2:
  ```
  createRouteBlkAlongTrack -layer M2 -align_track M3 -edge_shrink {5 5}
  ```



Related Information

- `createRouteBlk`
- `deleteRouteBlk`

createRow

```
createRow
[-help]
-site siteName
[-area {x1 y1 x2 y2} | -boxList {{x1 y1} {x2 y2} ...} | -polygon {{x1 y1} {x2 y2}...}]
[-spacing distance]
[-limitInCore]
[-noAbut | -noAbut1st]
[-flip1st]
[-noCheck]
[-noFlip]
```

Creates rows for the specified site. The row boundary can be defined by core area or the area that you specify. This command supports the creation of overlapping rows. This command can create only horizontal rows. By default, alternate rows are flipped and all rows are abutted (no spaces between rows).

The following points apply to the usage of this command:

- Rows can be created both inside and outside the core area, but within the die.
- All new rows created in an area must be an integer multiple of any existing rows in the same area.
- Non-integer multiple height rows cannot be created outside power domains.

Use this command after importing a design.

Parameters

`-area {x1 y1 x2 y2}`	
	Create rows in the specified rectangle. (Default is within the core box.) The values are floats, units are microns. Rows are truncated at the die box boundary. Either a tcl list or 4 separate parameters works. • `x1`: Specifies the lower left x coordinate of the area. • `y1`: Specifies the lower left y coordinate of the area. • `x2`: Specifies the upper right x coordinate of the area. • `y2`: Specifies the upper right y coordinate of the area. *Data_type*: box, optional
`-boxList {{x1 y1} {x2 y2} ...}`	
	The X and Y values are floats, units are microns. There must be an even number of points specified. Pairs of points are used to determine a set of rectangles, where the first point of the pair is LLX, LLY, the second point is URX, URY. Rectangles need not be overlapping. Rows are created in the union of the rectangles defined. Note that for overlapping rectangles, rows are created continuously starting at the first (bottom) row (of the lowest rectangle). For non-overlapping rectangles, rows are created independently starting at the bottom of each rectangle. *Data_type*: point_list, optional
`-flip1st`	Controls the orientation of the first (bottom) row, which is R0 by default. When `-flip1st`, the first row's orientation is MX. See `-noFlip`. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `createRow` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createRow`
`-limitInCore`	By default (none of `-area, -polygon, -boxList` specified) rows are created in the core box. When one of `-area, -polygon, -boxList` is specified, by default rows are created within the intersection of the die box and the specified rectilinear shape. When one of `-area, -polygon, -boxList` and `-limitInCore` is specified, rows are created within the intersection of the core box and the specified rectilinear shape. *Data_type*: bool, optional
`-noAbut`	Controls where spaces are inserted between rows. By default, spaces are inserted between pairs of rows. When `-noAbut` is enabled spaces are inserted between every row. See `-spacing` and `-noAbut1st`. *Default*: The rows are abutted by default. *Data_type*: bool, optional

`-noAbut1st`	Controls where the first space between rows is inserted. Default is that the first space is inserted after the first (lowest) *pair* of rows, and subsequently after every pair of rows (space inserted between 2nd and 3rd rows, between 4th and 5th rows, etc). When `-noAbut1st`, the first space is inserted after the first (lowest) row, and subsequently after every pair of rows (space inserted between 1st and 2nd rows, then 3rd and 4th rows, etc). See `-spacing` and `-noAbut`. *Data_type*: bool, optional
`-noCheck`	Specifies that the row should not be aligned to the existing row and should support redo undo. *Data_type*: bool, optional
`-noFlip`	By default rows have alternating orientation `(...MX R0 MX R0...)`, or when `-no_flip_rows` is specified rows have identical orientation (one of: `...R0 R0 R0...`; or `...MX MX MX...`). See `-flip1st`. *Data_type*: bool, optional
`-polygon {{x1 y1} {x2 y2}...}`	The X and Y values are floats, units are microns. There must be an even number of points specified. The points specify a polygon in which rows are created. Each pair of points specifies one edge of the polygon, so { X1 Y1 } and { X2 Y2 } specify one edge, { X2 Y2 } { X3 Y3 } specify the next edge, etc. The last edge is specified by { Xlast Ylast } { X1 Y1 }. In the degenerate case (multiple rectilinear areas touching at corners) rows will be created continuously starting at the lowest point. *Data_type*: point_list, optional
`-site siteName`	Specifies the name of the site to be used for creating the rows. (Objects not allowed.) *Data_type*: bool, optional
`-spacing`	Specifies the width of the space inserted between certain rows. The first (lowest) row is always inserted along the bottom edge of the area having rows added. If `-noAbut` is specified, then space is inserted between every subsequent row. The default is space is inserted between every other row. If `-noAbut1st` is specified, then space is inserted after the first row (and then the third etc). The default is that space is inserted after the second row (and then the 4th etc). Note that `-noAbut` and -noAbut1st are mutually exclusive. *Default*: 0.0 um *Data_type*: float, optional

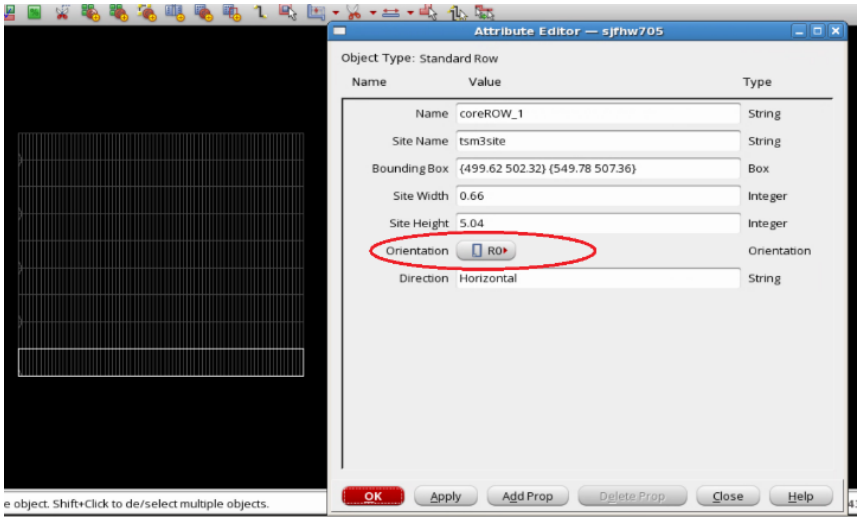
Example

- The following command creates rows for the site lt3site within the area defined by the coordinates 376.7, 577.57, 688.94, 725.68, maintaining a spacing of 1 micron between the rows, without the first row being abutted:

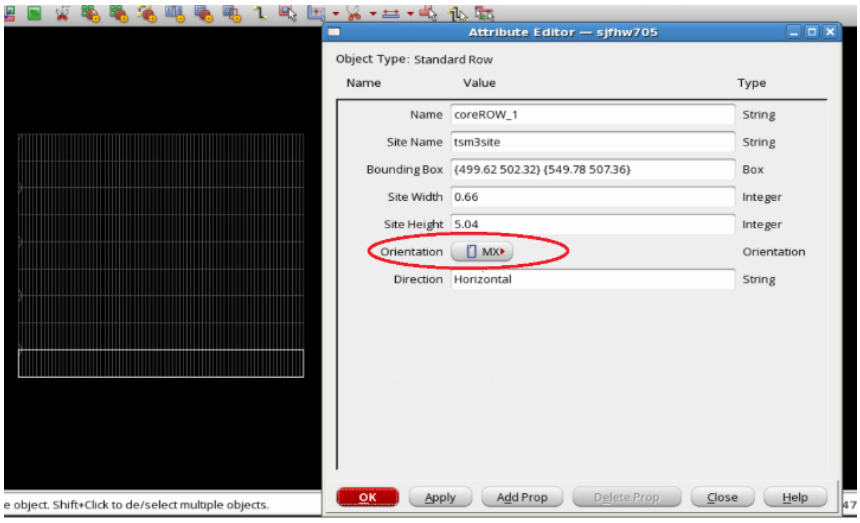
```
createRow -site lt3site -area 376.7 577.57 688.94 725.68 -spacing 1.0 -noAbut1st
```

- The following commands and images show the functionality of the option `flip1st` :

```
createRow -area {500 500 550 550} -site tsm3site :
```

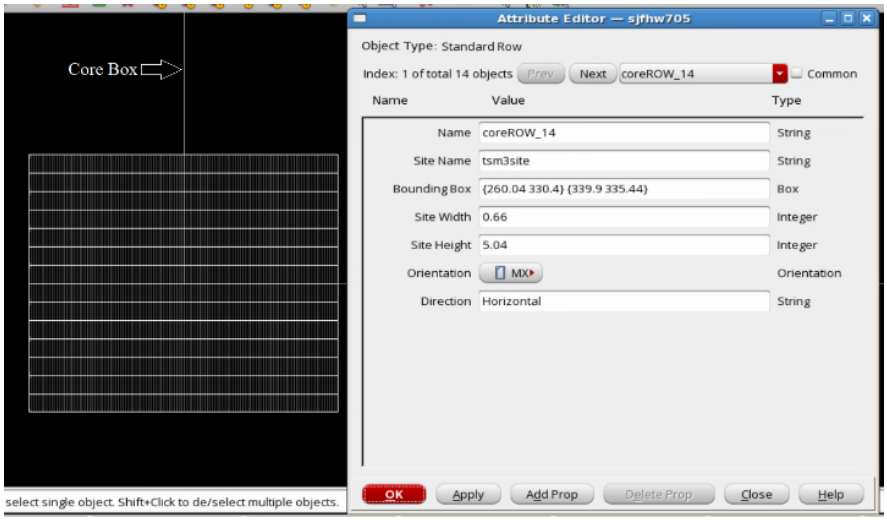


```
createRow -area {500 500 550 550} -site tsm3site -flip1st :
```

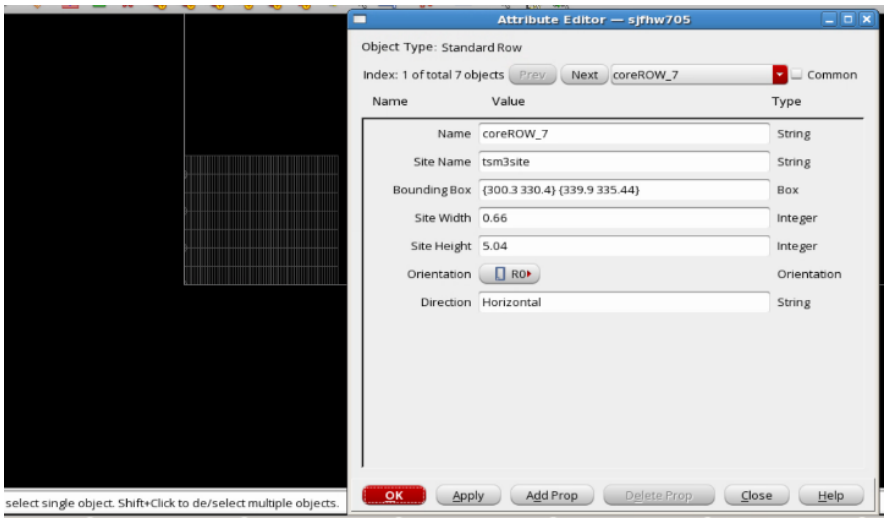


- The following commands and images show the functionality of the option `limitInCore` :

```
createRow -area {260 260 340 340} -site tsm3site:
```

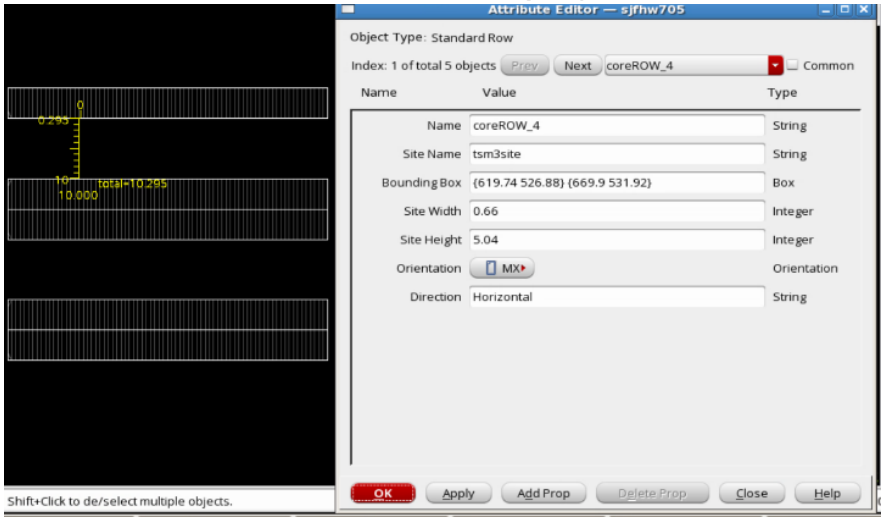


```
createRow -area {260 260 340 340} -site tsm3site -limitInCore:
```

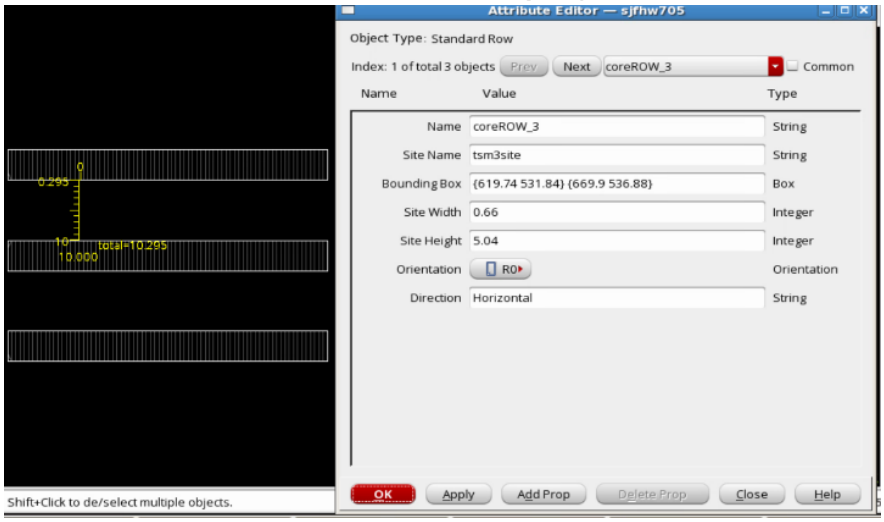


- The following commands and images show the capabilities of the options `spacing`, `noAbut` and `noAbut1st`:

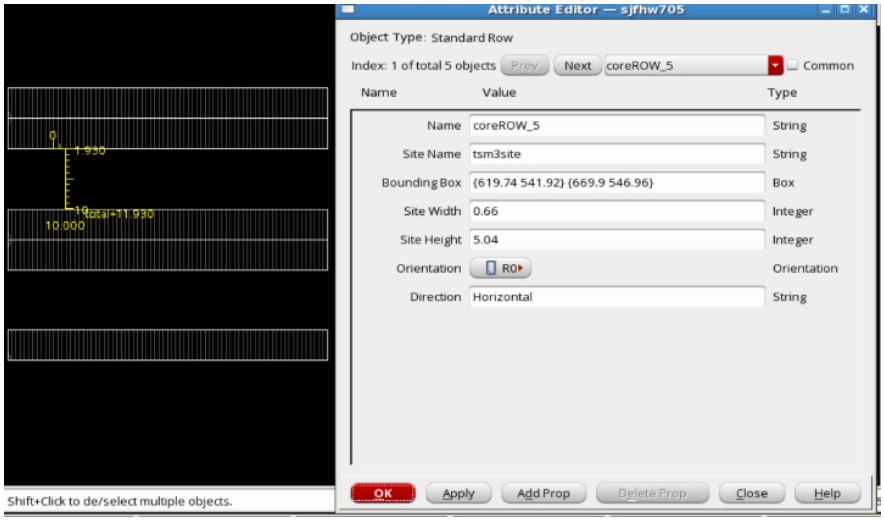
```
createRow -area {620 500 670 550} -site tsm3site -spacing 10:
```



```
createRow -area {620 500 670 550} -site tsm3site -spacing 10 -noAbut:
```

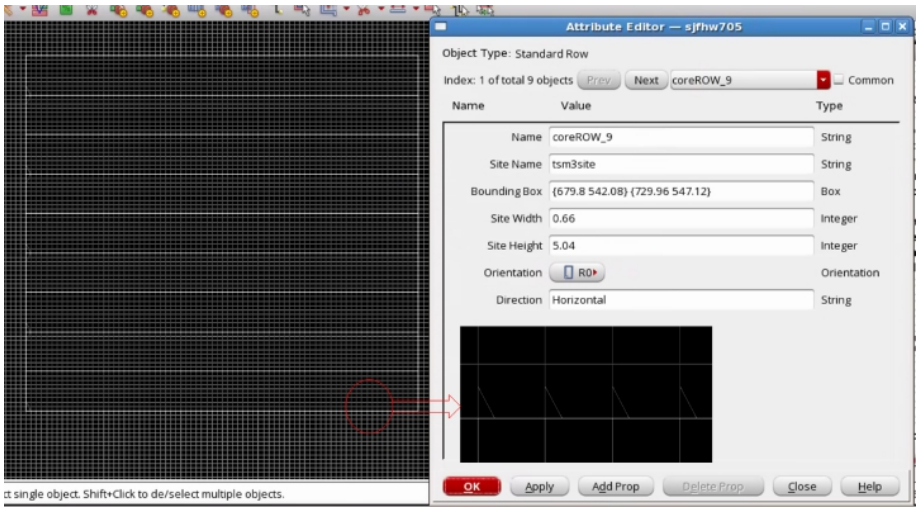


```
createRow -area {620 500 670 550} -site tsm3site -spacing 10 -noAbut1st:
```

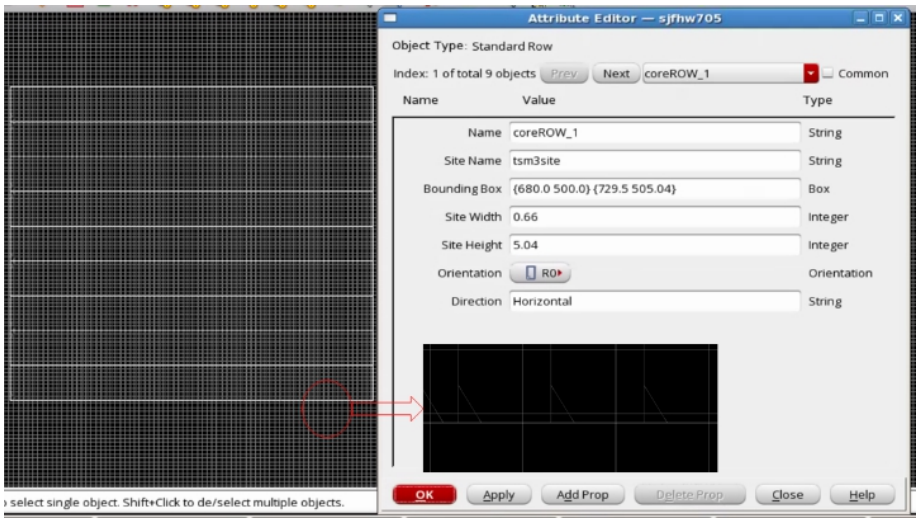


- The following commands and images show the capabilities of the options `noCheck` (The placement grid is opened):

```
createRow -area {680 500 730 550} -site tsm3site :
```

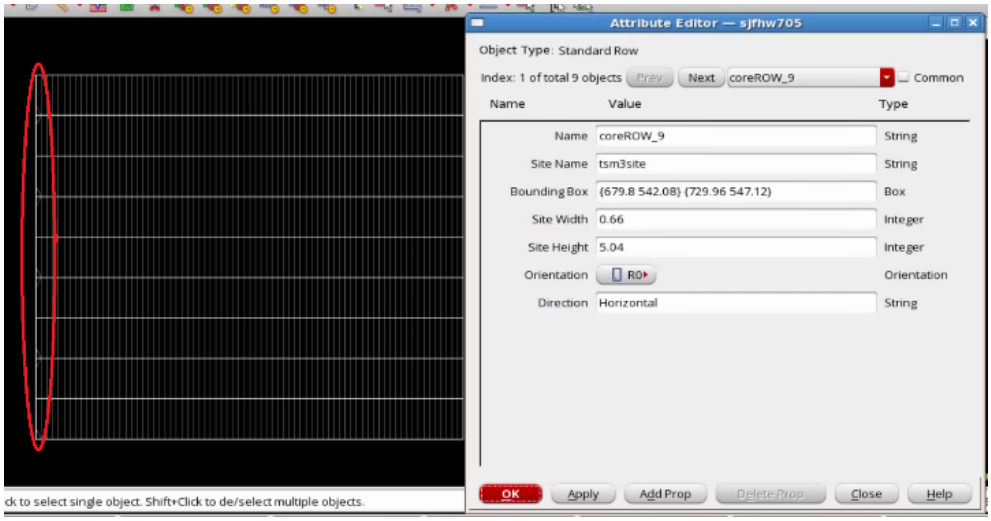


```
createRow -area {680 500 730 550} -site tsm3site -noCheck :
```



- The following commands and images show the capabilities of the option `noFlip`:

```
createRow -area {680 500 730 550} -site tsm3site :
```



```
createRow -area {680 500 730 550} -site tsm3site -noFlip:
```

createSoftGuide

```
createSoftGuide
[-help]
name
```

Creates a soft guide for a module or a group. Use this command after importing a design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `createSoftGuide` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createSoftGuide`
name	Specifies the name of module or group. *Data_type*: string, required

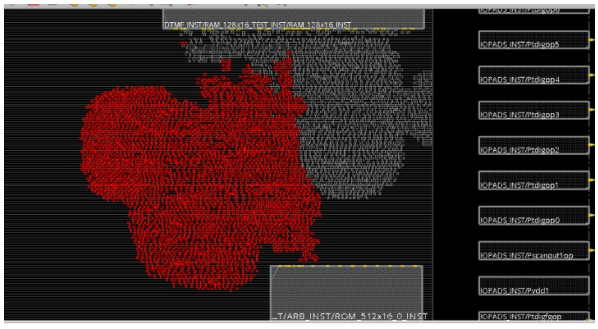
Examples

- The following command creates a soft guide for hierarchical instance DTMF_INST/TDSP_CORE_INST:

  `createSoftGuide DTMF_INST/TDSP_CORE_INST`:

  `Before placement`:

  
  `After placement`:

- The following command creates a soft guide for group adder1:

  `createSoftGuide adder1`

createSpecialDrcRegion

```
createSpecialDrcRegion
[-help]
[-extendOuterX float]
[-extendOuterY float]
[-extendX float]
[-extendY float]
[-insts string]
-layer string
```

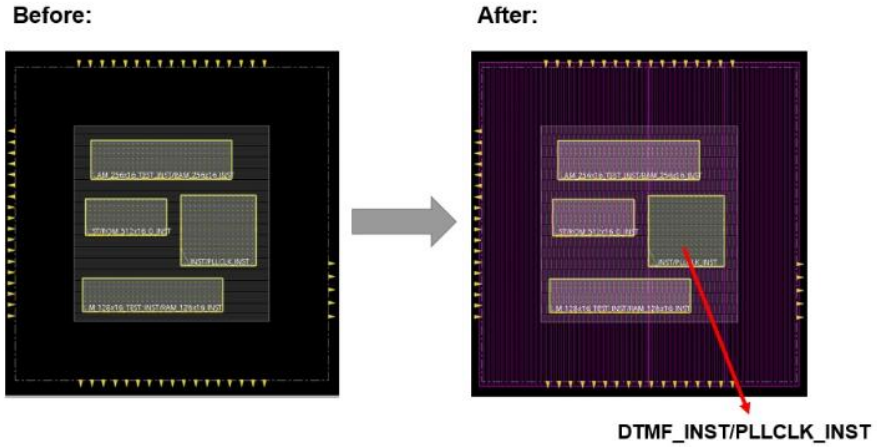
DRC region layers define a special masterslice layer that is used to define the areas of a region on which a set of rules defined in the metal, cut, and/or trim metal layers with the REGION property would be applied. The `createSpecialDrcRegion` command can be used to add drc region blockages in or around the die area except specified macros.

Parameters

`-extendOuterX` *float*	Expands the routing blockage in X direction. *Data_type*: float, optional
`-extendOuterY` *float*	Expands the routing blockage in Y direction. *Data_type*: float, optional
`-extendX` *float*	Expands the non-routing blockage in X direction. *Data_type*: float, optional
`-extendY` *float*	Expands the non-routing blockage in X direction. *Data_type*: float, optional
`-help`	Outputs a brief description that includes the type and default information for each `createSpecialDrcRegion` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createSpecialDrcRegion`
`-insts` *string*	Specifies the name of the hierarchical instance that are to be cut out. **Note:** Wild card characters are not supported while specifying hierarchical instance names. **Note:** All blocks are included if `-insts` is not specified or when `-insts{}` is specified. *Data_type*: string, optional
`-layer` *string*	Specifies the names of the layers on which the routing blockage is created. *Data_type*: string, optional

Example

- The following command creates a routing blockage on R1 that blocks out `DTMF_INST/PLLCLK_INST`:
  `createSpecialDrcRegion -layer R1 -extendOutterX 10 -extendOutterY 20 -insts DTMF_INST/PLLCLK_INST`



- The following command creates a routing blockage on R1 that blocks out `DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST`:
  `createSpecialDrcRegion -layer R1 -extendX 10 -extendY 20 -insts DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST`

createSpecialMarkLayerShape

```
createSpecialMarkLayerShape
[-help]
[-cutOutBlockInsts string]
[-extendOuterX float]
[-extendOuterY float]
[-extendX float]
[-extendY float]
-layer string
```

Creates a mark layer shape, using special route. This command enables you to apply one set of rules for the entire design in Innovus by connecting the macro pins around halo of IP blocks. The IPs are selected based on a list which provides the instance name.

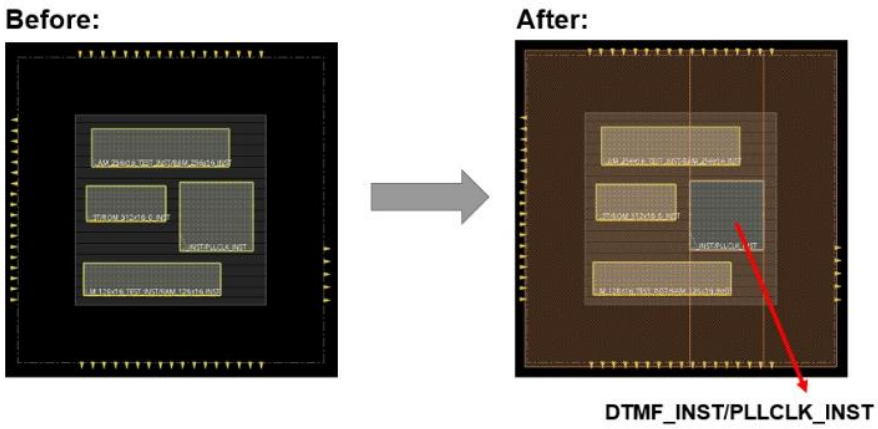
Parameters

`-cutOutBlockInsts` *string*	Specifies the name of the instances that are to be cut out. **Note:** All blocks are cut out if `-cutOutBlockInsts` is not specified however, if `-cutOutBlockInsts {}` is specified then all blocks are NOT cut as this pattern cannot match anything. *Data_type*: string, optional
`-extendOuterX` *float*	Expands the mark layer shape in X direction. *Data_type*: float, optional
`-extendOuterY` *float*	Expands the mark layer shape in Y direction. *Data_type*: float, optional
`-extendX` *float*	Expands the no-mark layer shape in X direction. *Data_type*: float, optional
`-extendY` *float*	Expands the no-mark layer shape in Y direction. *Data_type*: float, optional
`-help`	Outputs a brief description that includes the type and default information for each `createSpecialMarkLayerShape` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createSpecialMarkLayerShape`
`-layer` *string*	Specifies the names of the layers on which the mark layer shape is to be applied. *Data_type*: string, required

Example

- The following command creates a mark layer shape on M2_P48 that blocks out `DTMF_INST/PLLCLK_INST` and expands the marker layer shape by 10 in X direction and by 20 in Y direction:

```
createSpecialMarkLayerShape -cutOutBlockInsts DTMF_INST/PLLCLK_INST -extendOuterX 10 -extendOuterY 20 -layer M2_P48
```



- The following command creates a mark layer shape on M2_P48 that blocks out `DTMF_INST/PLLCLK_INST` and expands the no-mark layer shape by 10 in X direction and by 20 in Y direction:

```
createSpecialMarkLayerShape -cutOutBlockInsts DTMF_INST/PLLCLK_INST -extendX 10 -extendY 20 -layer M2_P48
```

createStairwayBoundary

```
createStairwayBoundary
[-help]
-dx value
-dy value
[-growNeighborPtnDir {x y}]
-ptn partition_name
-step number_of_steps
{-corner {LL LR UL UR} | -vertex number_of_vertex}
```

Creates small stairway rectilinear edges at a specified partition corner to improve congestion.

Note: This command does not support master/clones.

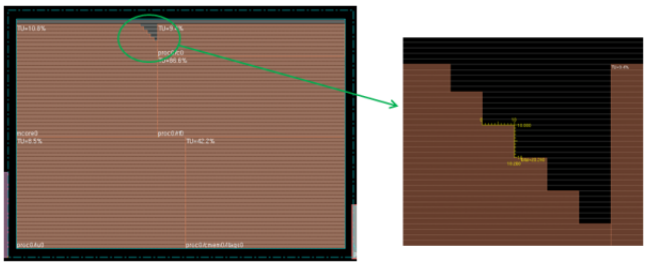
Note: The `-dx`, `-dy`, `-ptn`, `-step`, and `-corner/-vertex` options should be set by default. The partition will snap to the row automatically.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `createStairwayBoundary` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createStairwayBoundary`
`-corner {LL LR UL UR}`	Specifies partition corner where a stairway will be created. • `UL`: Upper left • `LL`: Lower left • `LR`: Lower right • `UR`: Upper right *Data_type*: enum, optional
`-dx value`	Specifies step width. *Data_type*: float, required
`-dy value`	Specifies step height. *Data_type*: float, required
`-growNeighborPtnDir {x y}`	
	Specifies the direction of the target partition in which the neighbor partition will grow to fill the stairway gap between the target partition and the neighbor partition. If this option is not specified, no abutted partition will grow. *Data_type*: enum, optional
`-ptn partition_name`	Specifies the name of the target partition. *Data_type*: string, required
`-step number_of_steps`	Specifies the number of steps to be created in stairway. *Data_type*: int, required
`-vertex number_of_vertex`	Specifies partition vertex where stairway will be created. Vertex starts from the lower-left corner of the partition clockwise. The first vertex is 0. A vertex can be negative, and for a negative vertex, corner numbering starts at 0 from the lower-left corner of a partition counter clockwise.  *Data_type*: int, optional

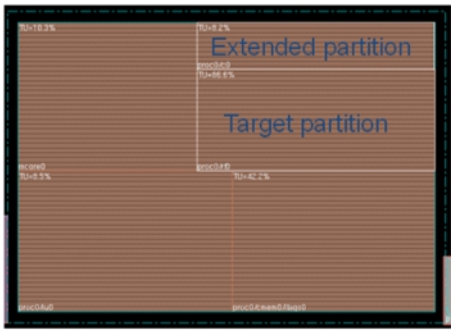
Examples

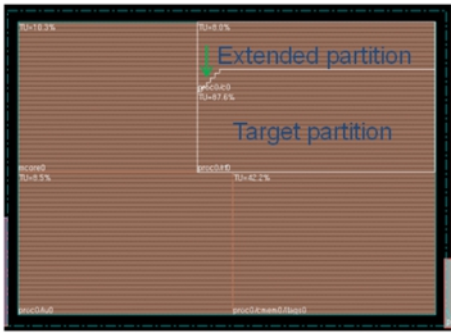
- The following command creates five-stairway rectilinear edges. The width and height of steps are 10.
  ```
  createStairwayBoundary -dx 10 -dy 10 -ptn mcore -step 5 -corner UR
  ```



- The following command sets `-growNeighborPtnDir y`, and the partition next to the target partition in the Y direction extends.

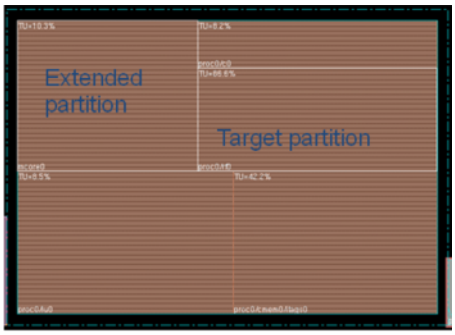
```
createStairwayBoundary -dx 10 -dy 10 -ptn regfile_iu_rftype2_abits8_dbits32_words136  -step 5 -corner UL -growNeighborPtnDir y
```

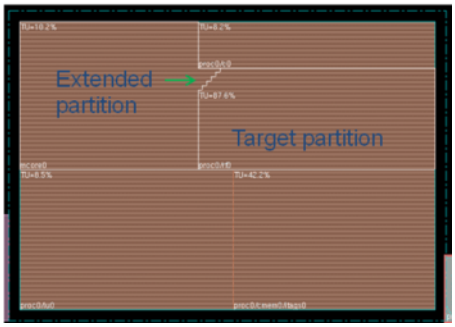




- The following command sets `-growNeighborPtnDir x`, and the partition next to the target partition in the X direction extends.

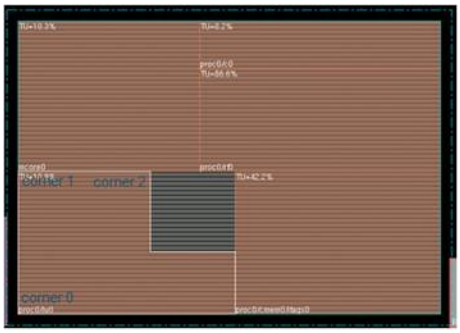
```
createStairwayBoundary -dx 10 -dy 10 -ptn regfile_iu_rftype2_abits8_dbits32_words136  -step 5 -corner UL -growNeighborPtnDir x
```

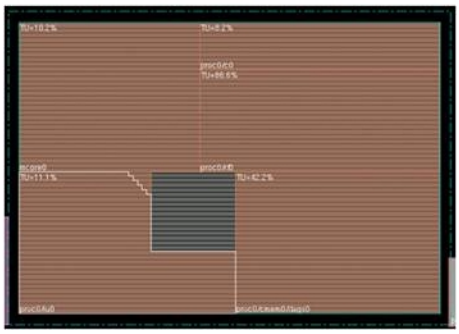




- The following command changes the vertex 2 to a stairway.

```
createStairwayBoundary -dx 10 -dy 10 -ptn iu  -step 5 -vertex 2 -growNeighborPtnDir y
```





Related Information

cutRectilinearInst

```
cutRectilinearInst
[-help]
-inst instName
{{-refInst instName [-spacingX xvalue] [-spacingY yvalue]} |
{-cutBox {x1 y1 x2 y2}} | {-corner cornerValue [-x value -y value]}}
[-pushOut sideEdgeName]
```

Cuts partition or black box boundaries to rectilinear instances that fit blocks in a given die, without modifying the existing block area. The command performs the rectilinear cut based on the following criteria that you specify:

- The name of a hierarchical instance.
- The name of a referenced instance.
- The name of corner where the cut is to be defined.
- The x and y offset values, in microns, from a specific corner or an overlapping area.
- The name of a side or edge that is to be pushed out, to maintain the existing block area.

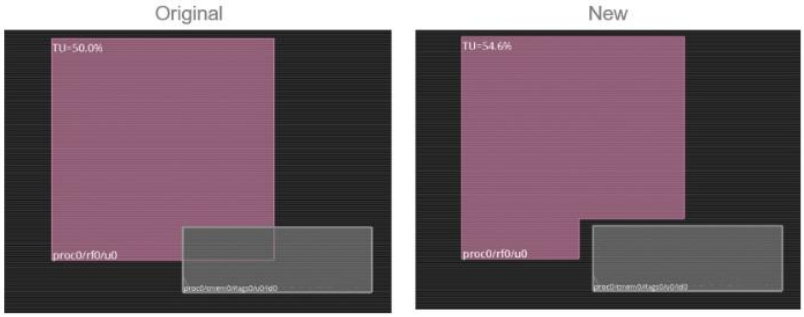
You can use the command at any point in the design flow

Parameters

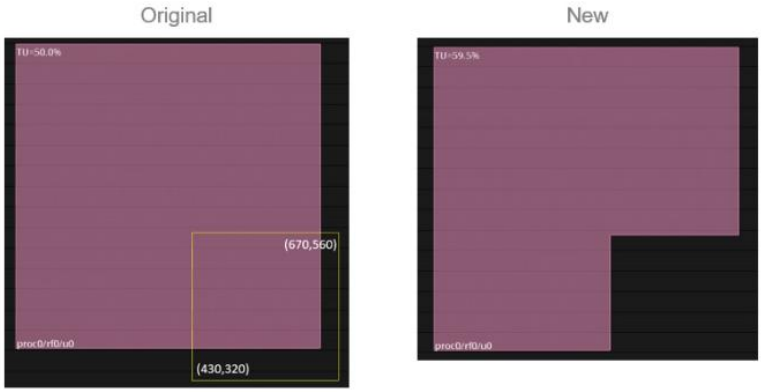
`-corner` *`cornerValue`*	Specifies the name of a corner from where the cut is to be defined. This can be lx, ly, ux, uy coordinates, or edge number in case of a rectilinear corner. Edge numbers are counted clock-wise from the lower left corner starting with 0. *Data_type*: string, optional
`-cutBox`	Specifies the rectilinear box that is to be cut. • *`x1`*: Specifies the lower left x coordinate of the cut area. • *`y1`*: Specifies the lower left y coordinate of the cut area. • *`x2`*: Specifies the upper right x coordinate of the cut area. • *`y2`*: Specifies the upper right y coordinate of the cut area. *Data_type*: box, optional
`-help`	Outputs a brief description that includes the type and default information for each `cutRectilinearInst` parameter. For a detailed description of the command and all of its parameters, use the man command: `man cutRectilinearInst`
`-inst` *`instName`*	Specifies the name of a hierarchical instance. The instance can be a module, an uncommitted partition or a black box. *Data_type*: (inst|hinst|group)+, required
`-pushOut` *`sideEdgeName`*	Specifies the x offset value, in microns, from a specified corner. Corner numbers are counted clock-wise from the lower left corner starting with 0. This can be: • top • bottom • left • right • rectilinear edge number **Note**: If you do not specify a side or edge, the `cutRectilinearInst` command will not maintain the existing area and all the sides or edges are modified by default. *Data_type*: string, optional
`-refInst` *`instName`*	Specifies the name of a reference instance. The instance can be a module, an uncommitted partition, a black box or a hard macro. *Data_type*: (inst|hinst|group)+, required

`-spacingX` *`xValue`*	Specifies the x offset value, in microns, of the overlapping area between the specified block and the reference object. *Default*: 0  *Data_type*: float, optional
`-spacingY` *`yValue`*	Specifies the y offset value, in microns, of the overlapping area between the specified block and the reference object. *Default*: 0 *Data_type*: float, optional
`-x` *`xValue`*	Specifies the x offset value, in microns, from a specified corner. Corner numbers are counted clock-wise from the lower left corner starting with 0.  *Data_type*: float, optional
`-y` *`yValue`*	Specifies the y offset value, in microns, from a specified corner. *Data_type*: float, optional

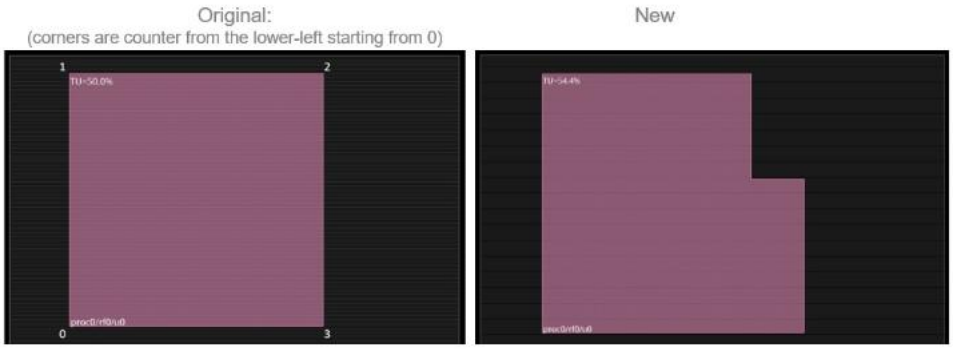
Example

- The following command cuts away the area of proc0/rf0/u0 which overlaps proc0/cmem0/itags0/u0/id0, plus an additional 30um in the X-direction and 15um in the Y-direction resulting in the shape below:
  ```
  cutRectilinearInst -inst proc0/rf0/u0 -refInst proc0/cmem0/itags0/u0/id0 -spacingX 30 -spacingY 15
  ```
  


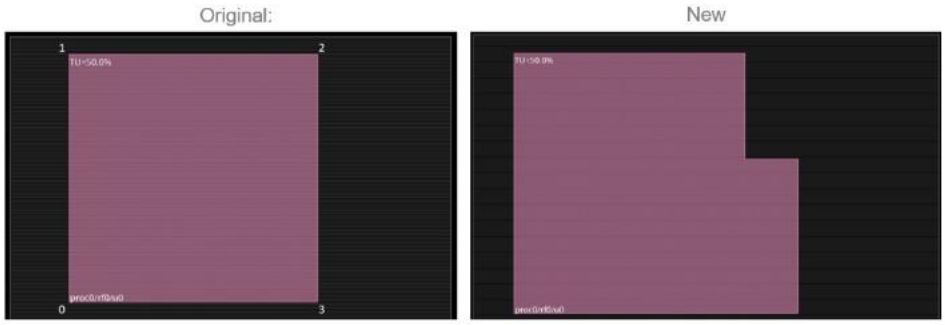
- The following command cuts away the intersection of the module and cut box resulting in the shape below:
  ```
  cutRectilinearInst -inst proc0/rf0/u0 -cutBox 430 320 670 560
  ```



- The following command ccuts the module at corner number 2. The cut is 100um in the X-direction and 200um in the Y-direction:
  ```
  cutRectilinearInst -inst proc0/rf0/u0 -corner 2 -x 100 -y 200
  ```



- The command following cuts the module at corner number 2. The cut is 100um in the X-direction and 200um in the Y-direction. The area is maintained by pushing out the left edge (notice utilization of 50% is maintained):
  ```
  cutRectilinearInst -inst proc0/rf0/u0 -corner 2 -x 100 -y 200 -pushOut left
  ```



Related Information

cutRow

```
cutRow
[-help]
[-area box | -object string | -selected | -fromIo {left bottom right top}]
[-halo float| {-leftGap float| -rightGap float | -topGap float | -bottomGap float}]
[-site name]
[-keepCell]
```

Cuts site rows within an area or that intersect with the selected object(s). Use this command after rows have been created. Only insts, hinsts, place blockages, route blockages, power domains, groups, or bumps can participate in row splitting.

Note: The default behavior is to cut rows that intersect with placement blockages and macros.

Parameters

`-area box`	Rows will be cut within the specified box. `box` is a tcl list containing 4 items. The items are, in order: `LLX, LLY, URX, URY`. **Note:** The `-halo` parameter cannot be applied `-area` used. *Data_type*: box, optional
`-bottomGap float`	Specifies the additional gap to be provided on the bottom side of the specified or selected object. *Data_type*: float, optional
`-fromIo {left bottom right top}`	
	Cuts core rows to keep them away from I/O cells in the minimum distance specified. `Left` means for IO cells on left side of die box, and so forth. *Data_type*: box, optional
`-halo float`	Specifies additional space to be provided on the top, bottom, left, and right sides of the objects causing rows to be cut. Rows are cut to the expanded boundary. The same value is used for all sides. *Data_type*: float, optional
`-help`	Outputs a brief description that includes the type and default information for each `cutRow` parameter. For a detailed description of the command and all of its parameters, use the man command: `man cutRow`
`-keepCell`	Specifies that all cells that are placed inside the cut row area will not be unplaced. *Default*: All cells inside the cut rows will be unplaced. *Data_type*: bool, optional
`-leftGap float`	Specifies the additional gap to be provided on the left side of the specified or selected object. *Data_type*: float, optional
`-object string`	Specifies the name of an intersecting object. Rows that intersect this object are cut. Only one name may be specified. *Data_type*: string, optional
`-rightGap float`	Specifies the additional gap to be provided on the right side of the specified or selected object. *Data_type*: float, optional
`-selected`	Specifies that the rows that intersect with the selected object(s) will be cut. **Note:** Only supports inst, hinst, power domain, group, place blockage, route_blockage, and bump as selected object(s). *Data_type*: bool, optional
`-site name`	Rows containing site `name` will be cut. *Default*: All rows in the core box are cut. *Data_type*: string, optional
`-topGap float`	Specifies the additional gap to be provided on the top side of the specified or selected object. *Data_type*: float, optional

Example

- The following command cuts the rows containing sites of type `SITE_FE283001` in the specified area:
  ```
  cutRow -site SITE_FE283001 -area 124.975 138.123 237.378 223.38
  ```
- The following command cuts the rows intersecting with selected objects, with a 0.5 micron halo:
  ```
  cutRow -selected -halo 0.5
  ```
- The following command cuts the rows intersecting with the object named `fuu`, with additional bottom gap of 0.5 microns:
  ```
  cutRow -object fuu -bottomGap 0.5
  ```

delete_bump_grid

```
delete_bump_grid
[-help]
[-grid_names string | -all ]
```

Removes the bump grid from the design. Use this command anytime after creating a bump grid.

Parameters

`-all`	Deletes all the bump grids. *Data_type*: bool, optional
`-grid_names` *string*	Specifies the name(s) of the bump grid to be deleted. *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `delete_bump_grid` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_bump_grid`

Example

- The following command deletes all the bump grids in the current design:
  ```
  delete_bump_grid -all
  ```
- The following command deletes the `myGridFront_9x9` named bump grid:
  ```
  delete_bump_grid -grid_names {myGridFront_9x9}
  ```
- The following command deletes multiple bump girds:
  ```
  delete_bump_grid -grid_names {myGridFront_9x9 myGridFront_25x25}
  ```

Related Information

- `create_bump_grid`

delete_relative_floorplan

```
delete_relative_floorplan
[-help]
{obj_name_list | -all}
```

Removes the relative floorplan information from the database. It deletes all relative floorplan constraints, all relative constraints for the specified object(s), or removes the last executed relative floorplan action from the database. Use this command after running `create_relative_floorplan`.

Notes:

- The arrows showing relative constraints for the specified objects are removed from the floorplan display.
- The `delete_relative_floorplan` command accepts an array of objects.

Parameters

`-all`	Delete all relative floorplan constraints. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `delete_relative_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_relative_floorplan`
obj_name_list	Deletes all relative constraints for the specified object(s). **Note**: If you do not specify *obj_name_list*, this command removes the last executed relative floorplan action from the database. *Data_type*: string, optional

Example

- The following command deletes obj1, obj2, and obj3 from the database:
  ```
  delete_relative_floorplan {obj1 obj2 obj3}
  ```

Related Information

- `create_relative_floorplan`
- Floorplanning the Design chapter in the *Innovus User Guide*

deleteAllDensityAreas

```
deleteAllDensityAreas
[-help]
```

Removes all partial placement blockages from the floorplan. Use this command after importing the design.

Parameters

`-help`	Outputs a brief description of the `deleteAllDensityAreas` command. For a detailed description of the command, use the man command: `man deleteAllDensityAreas`

Related Information

- `createDensityArea`
- `setSelectedDensityArea`
- Floorplanning the Design chapter in the *Innovus User Guide*

deleteAllFPObjects

```
deleteAllFPObjects
[-help]
```

Removes all floorplan objects. The density screen, obstruction, power strips, and route guides objects are deleted. The guides and block guides are cleared from the design area. The physical instance groups are also cleared from the core area. Use this command after importing the design.

Parameters

`-help`	Outputs a brief description of the `deleteAllFPObjects` command. For a detailed description of the command, use the man command: man deleteAllFPObjects

Related Information

- `deleteSelectedFromFPlan`
- Floorplanning the Design chapter in the *Innovus User Guide*

  - Clear Floorplan

deleteAllInstGroups

```
deleteAllInstGroups
[-help]
```

Removes all instance groups. Instance groups are user-created and contain instances and/or other groups. Use this command after importing the design.

Parameters

`-help`	Outputs a brief description of the `deleteAllInstGroups` command. For a detailed description of the command, use the man command: `man deleteAllInstGroups`

Examples

- The following command removes all instance groups:
  ```
  deleteAllInstGroups
  ```

Related Information

deleteAllPowerPreroutes

```
deleteAllPowerPreroutes
[-help]
```

Removes all power preroutes from the floorplan. Use this command after importing the design.

Parameters

None

`-help`	Outputs a brief description of the `deleteAllPowerPreroutes` command. For a detailed description of the command, use the man command: `man deleteAllPowerPreroutes`

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

deleteAllSignalPreroutes

```
deleteAllSignalPreroutes
[-help]
```

Removes all signal preroutes from the floorplan. Use this command after importing the design.

Parameters

`-help`	Outputs a brief description of the `deleteAllSignalPreroutes` command. For a detailed description of the command, use the man command: `man deleteAllSignalPreroutes`

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

deleteExclusiveGroups

```
deleteExclusiveGroups
[-help]
[-all | group_name]
```

Deletes existing exclusive regions for groups. You can use this command after creating exclusive groups. It restores all attributes of exclusive groups

Parameters

`-all`	Deletes all exclusive regions. When specified, the tool resets all existing exclusive groups attributes to their default values. *Data_type*: bool, optional
group_name	Specifies the name of the group to delete. The tool deletes exclusive regions of the specified groups and all other exclusive groups that have been created together. You can specify one or multiple groups after the command. *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `deleteExclusiveGroups` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteExclusiveGroups`

Examples

- The following command deletes all exclusive regions of groups (A,B,C,D,E,F).
  ```
  deleteExclusiveGroups -all
  ```
- The following command deletes exclusive regions of groups A and F.
  ```
  deleteExclusiveGroups {A F}
  ```
- The following command deletes exclusive regions of groups (A,B,C).
  ```
  deleteExclusiveGroups B
  ```

Related Information

- `createExclusiveGroups`
- Floorplanning the Design chapter in the *Innovus User Guide*

deleteFPObject

```
deleteFPObject
[-help]
objectType
objectName
```

Deletes the specified floorplan object by name. You can use the command at any point in the design flow.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `deleteFPObject` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteFPObject`
`objectName`	Specifies the name of the object for the *`objectType`*. To get *`objectName`*, you can use *`dbObjToName objPtr`* where *`objPtr`* is the target object db pointer. *Data_type*: string, required
`objectType`	Specifies the type of object for the *`objectName`*. The object type can be any of the following: • Placement Blockage (`LayerShape`) • Partial Placement Blockage (`LayerShape`) • Routing Blockage (`LayerShape`) • Partition Feedthrough (`PtnFeed`) • Partition Pin Blockage (`PtnPinBlk`) *Data_type*: string, required

Examples

- The following command deletes the placement blockage (658300,824180,874060,1048640) from the current design:
  ```
  deleteFPObject LayerShape (658300,824180,874060,1048640)
  ```
  Note: You can get `"objectName"` by using `[dbObjToName objPtr]`, where `objPtr` is the db pointer to the placement blockage object.

  This is similar to,
  ```
  deleteFPobject LayerShape [dbObjToName objPtr]
  ```
- The following command deletes the Partial Placement Blockage from the current design:
  ```
  deleteFPObject LayerShape (1079960,1006880,1211620,1111280)
  ```
- The following command deletes the Routing Blockage from the current design:
  ```
  deleteFPObject LayerShape (628350,905550,857290,1057010)
  ```
- The following command deletes the Partition Feedthrough from the current design:
  ```
  deleteFPObject PtnFeed (980200,912920,1298040,954140)
  ```
- The following command delete Partition Pin Blockage from the current design:
  ```
  deleteFPObject PtnPinBlk (970780,947630,1007150,1012280)
  ```

deleteHaloFromBlock

```
deleteHaloFromBlock
[-help]
[inst_name | -allMacro | -allBlackBox | -allCommitPtn  | -allBlock | -allIOPad | -cell name]
```

Removes block halo values for specific blocks or for all blocks. Use this command after running `addHaloToBlock`.

Parameters

`-allBlackBox`	Specifies the removal of halo values for all black boxes. *Data_type*: bool, optional
`-allBlock`	Specifies the removal of halo values for all blocks. *Data_type*: bool, optional
`-allCommitPtn`	Specifies the removal of halo values for all committed partitions. *Data_type*: bool, optional
`-allIOPad`	Specifies the removal of halo values for all IO pads. *Data_type*: bool, optional
`-allMacro`	Specifies the removal of halo values for all hard macros. *Data_type*: bool, optional
`-cell name`	Specifies the removal of halo values for all instances of a cell. *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `deleteHaloFromBlock` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteHaloFromBlock`
inst_name	Specifies the block where the halo is to be deleted. You can use wildcards (* or ?) for specifying instance names. *Data_type*: string, optional

Example

The following command removes block halo values from a hard macro named cube32:

```
deleteHaloFromBlock cube32
```

deleteInstFromInstGroup

```
deleteInstFromInstGroup
[-help]
group_name
object_name
```

Removes a hierarchical instance, an instance or list of instances, or a group from a specified group. You can pass a list of instances and instance pointers to the `deleteInstFromInstGroup` command. Use this command after importing the design.

Parameters

group_name	Specifies the name of the created group. *Data_type*: (group), required
-help	Outputs a brief description that includes the type and default information for each `deleteInstFromInstGroup` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteInstFromInstGroup`
object_name	Specifies the name of the object, another group, hierarchical instance, or leaf instance name. You can use wildcards (*?) with this parameter. **Note:** You can specify an instance names list in the { *inst_name_list* } format. The names list option is used for instances only and NOT for group or hierarchical instances. *Data_type*: (inst|hInst|group)*, required

Examples

- The following command removes hierarchical instance MEM_DSCAN from group adder1:
  ```
  deleteInstFromInstGroup adder1 MEM_DSCAN
  ```
- The following command removes group subadder from group adder1:
  ```
  deleteInstFromInstGroup adder1 subadder
  ```
- The following command removes all instance names that begin with the letter G from group adder1:
  ```
  deleteInstFromInstGroup adder1 G*
  ```

Related Information

  - Grouping Instances

deleteInstGroup

```
deleteInstGroup
[-help]
group_name
```

Removes a group that was created. Use this command after creating an instance group name.

Note: If the group being removed is also a power domain, a warning will be displayed and the command will not be executed.

Parameters

group_name	Specifies the name of the user created instance group name. *Data_type*: string, required
-help	Outputs a brief description that includes the type and default information for each `deleteInstGroup` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteInstGroup`

Example

The following commands create and remove the instance group ADDER1:

```
createInstGroup ADDER1
deleteInstGroup ADDER1
```

deleteIoFiller

```
deleteIoFiller
[-help]
[-cell {name_list}]
[-from coord]
[-prefix prefix]
[-ring num]
[-side {top | bottom | left | right}]
[-to coord]
[-logic [-deriveConnectivity]]
```

Deletes I/O filler cell instances from the design. Use this command after filler cells have been added using the `addIoFiller` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `deleteIoFiller` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteIoFiller`
`-cell {name_list}`	Specifies the name list of the I/O filler cells to be removed. *Data_type*: list, optional
`-deriveConnectivity`	Deletes connectivity for I/O fillers. *Data_type*: bool, optional
`-from coord`	Specifies the coordinates of the starting location from where I/O filler cells are to be removed. The values are in micrometers. *Data_type*: float, optional
`-logic`	Deletes non-physical logical I/O filler cells created by the addIoFiller command. *Data_type*: bool, optional
`-prefix prefix`	Specifies the prefix of the names of I/O filler instances to be removed. *Data_type*: float, optional
`-ring num`	Specifies the number of the ring from which I/O filler cells are to be removed. Use this parameter if you want to delete I/O filler cell instances from only a specific I/O ring in a multiple I/O ring design. *Data_type*: int, optional
`-side {top | bottom | left | right}`	
	Specifies the side as top side, bottom side, left side, and right side of the I/O box from which the I/O filler cells are to be removed. *Default*: If you do not specify this parameter, all sides are specified. *Data_type*: string, optional
`-to coord`	Specifies the coordinates of the ending location till which I/O filler cells are to be removed. The values are in micrometers. *Data_type*: float, optional

Related Information

- `addIoFiller`
- Floorplanning the Design chapter in the *Innovus User Guide*

deleteIoInstance

```
deleteIoInstance
[-help]
-instName {name1 name2 ...}
```

Deletes the specified I/O instance. You can use this command at any point in the design flow.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `deleteIoInstance` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteIoInstance`
`-instName {name1 name2 ...}`	
	Specifies the name(s) of I/O instance(s) to be deleted. *Data_type*: list, required

Example

- The following command deletes the specified I/O instance:
  `deleteIoInstance -instName` newIo

Related Information

- `addIoInstance`
- Floorplanning the Design chapter in the *Innovus User Guide*

deleteIoRowFiller

```
deleteIoRowFiller
[-help]
-cell {fillerCellNameList ...}
[-logic]
[-prefix prefix]
[-ioRow name]
[-from coord] [-to coord]
```

Deletes the I/O row filler cells. You can use this command at any point in the design flow.

Parameters

`-cell {fillerCellNameList ...}`	
	Specifies the name of the filler cell(s) to delete from the I/O row. *Data_type*: string, optional
`-from coord`	Specifies the coordinates of a specified starting range where I/O filler cells are to be deleted. The values are in micrometers. *Data_type*: float, optional
`-help`	Outputs a brief description that includes the type and default information for each `deleteNetWeight` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteNetWeight`
`-ioRow name`	Specifies the name of the I/O row to delete the filler cell. *Data_type*: string, optional
`-logic`	Deletes non-physical I/O fillers. *Data_type*: bool, optional
`-prefix prefix`	Specifies the prefix name to be appended to the I/O row filler cell to be deleted. *Data_type*: string, optional
`-to coord`	Specifies the coordinates of a specified ending range where I/O row filler cells to be deleted. The values are in micrometers. *Data_type*: float, optional

Example

- The following command deletes the specified I/O instance.
  ```
  deleteIoRowFiller -cell PAD8 -prefix PAD8
  ```

Related Information

- `createIoRow`
- `addIoRowFiller`
- Floorplanning the Design chapter in the *Innovus User Guide*
  - Performing I/O Row Based Pad Placement

deleteNetWeight

```
deleteNetWeight
[-help]
{-all | netName ...}
```

Removes the net weight values on the specified nets. You can use this command after running the `specifyNetWeight` command.

Parameters

`-all`	Specifies the removal of net weight values on all nets. *Data_type*: bool, required
`-help`	Outputs a brief description that includes the type and default information for each `deleteNetWeight` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteNetWeight`
netName	Specifies the net names, separated by spaces, for which the net weight values are removed. *Data_type*: string, required

Related Information

- `specifyNetWeight`
- `getNetWeight`
- Floorplanning the Design chapter in the *Innovus User Guide*

deletePGPin

```
deletePGPin
[-help]
[-area {x1 y1 x2 y2}]
[-layer layer_id | {list_of_layer}]
[-net net_name]
[-pg_port]
[-all | -selected ]
```

Deletes power/ground pins as per the specified parameters and reports the number of deleted power/ground pins. You can use this command at any point in the design flow.

Note: The `deletePGPin` command only deletes the pin shapes and fterms created using the `createPGPin` command. If the power/ground pins are added using the `loadFPlan` command, then the `deletePGPin` command only deletes the pin shapes and keeps the pg pins.

If there is no power/ground pin and pin box definition in the .fp.gz file, and you add the power/ground pins using the `createPGPin` command, then Innovus will automatically add the pg fterm for it. In such a case, the `deletePGPin` command deletes both pin shapes and pg pins.

Parameters

`-all`	Deletes all the power/ground pins. *Data_type*: bool, optional
`-area x1 y1 x2 y2`	
	Specifies a bounding box for the area in which power/ground pins are to be deleted. *Data_type*: box, optional
`-help`	Outputs a brief description that includes the type and default information for each `deletePGPin` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deletePGPin`
`-layer layer_id | {list_of_layer}`	
	Specifies the layer(s) on which the power/ground pins are to be deleted. **Note**: Layers can be specified using the LEF layer names or layer ID numbers. *Data_type*: string, optional
`-net net_name`	Specifies the name of the net whose attached power/ground pins are to be deleted. *Data_type*: (net)*, optional
`-pg_port`	Deletes pg ports with pg shape or deletes pg ports based on the net name specified with the `-net` option. *Data_type*: bool, optional
`-selected`	Deletes the selected power/ground pins. *Data_type*: bool, optional

Related Information

- `createPGPin`
- `loadFPlan`
- `addStripe`
- Floorplanning the Design chapter in the *Innovus User Guide*

deletePlaceBlockage

```
deletePlaceBlockage
[-help]
[-all | -type { hard | soft | partial | macroOnly}]
[-all | obs_name ...]
```

Removes all or individual placement obstructions from the floorplan. Use this command after importing the design.

Parameters

`-all`	Specifies that all placement obstructions are removed from the floorplan. *Data_type*: bool, required
`-help`	Outputs a brief description that includes the type and default information for each `deletePlaceBlockage` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deletePlaceBlockage`
obs_name	Specifies the name of an obstruction or a group of obstructions, with each obstruction name separated by a space. *Data_type*: list, required
`-type {hard | soft | partial | macroOnly}`	
	Specifies the type of blockage to delete. *Default*: `hard` *Data_type*: enum, required

Example

The following command deletes obstructions CTSOBS1 and ABCOBS:

```
deletePlaceBlockage CTSOBS1 ABCOBS
```

Related Information

- `createPlaceBlockage`
- `setFPlanMode`
- Floorplanning the Design chapter in the *Innovus User Guide*

deleteRouteBlk

```
deleteRouteBlk
[-help]
[-box {x1 y1 x2 y2} | -name blk | -all ]
[-layer layerName | {layerNameList} | all]
[-cutLayer layerName | {layerNameList} | all]
[-drcRegionLayer layerName | {layerNameList} | all]
[-trimMetalLayer layerName | {layerNameList} | all]
[-type {all | routes | fills | slots | partial}]
```

Deletes a routing blockage object. Use this command during partition floorplanning.

Note: The `deleteRouteBlk` command matches the layer name and the layer type while deleting routing blockages. If the layer name and the layer type do not match, the specified layer is not deleted and a warning about the mismatch is displayed. This rule is honored by standard layers, cutLayers, drcRegionLayers, and trimMetalLayers. When a list of layers is specified, only the layers matching with the specified layer type are deleted.

Parameters

`-all`	Removes all route blockage objects in the floorplan. *Data_type*: bool, required
`-box {x1 y1 x2 y2}`	
	Specifies the coordinates of the bounding box of the blockage area. *Data_type*: box, optional
`-cutLayer layerName | {layerNameList} | all`	
	Specifies the cut layer, list of cut layers, or all cut layers on which the routing blockage is to be deleted. *Default*: If you do not specify this parameter, it deletes the routing blockage object on all cut layers. *Data_type*: list, optional
`-drcRegionLayer layerName | {layerNameList} | all`	
	Specifies the drc region layer, list of drc region layers, or all drc region layers on which the routing blockage is to be deleted. *Default*: If you do not specify this parameter, it deletes the routing blockage object on all drc region layers. *Data_type*: list, optional
`-help`	Outputs a brief description that includes the type and default information for each `deleteRouteBlk` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteRouteBlk`
`-layer layerName | {layerNameList} | all`	
	Specifies the layer, list of layers, or all layers on which the routing blockage is to be deleted. *Default*: If you do not specify this parameter, it deletes the routing blockage object on all layers. *Data_type*: list, optional
`-name blk`	Specifies the name of the route blockage. You can specify wild cards as part of the route blockage name. *Data_type*: list, required
`-trimMetalLayer layerName | {layerNameList} | all`	
	Specifies the trim metal layer, list of trim metal layers, or all trim metal layers on which the routing blockage is to be deleted. *Data_type*: list, optional
`-type {all | routes | fills | slots | partial}`	
	Specifies the type of routing blockage to delete. The following options are available: • `all`: Deletes all types of blockages. • `routes`: Deletes the blockages that block routing. • `fills`: Deletes the blockages that block metal-fill. • `slots`: Deletes the blockages that block slots. • `partial`: Deletes partial routing blockages. Default: `all` *Data_type*: enum, optional

Examples

- The following commands create a blockage on all metal layers and deletes only on metal3:

```
createRouteBlk -box 11.2 164.07 95.005 319.205 -layer all
deleteRouteBlk -box 11.2 164.07 95.005 319.205 -layer 3
```

- The following commands create a blockage on all metal layers with the specific name BLK and deletes it.

```
createRouteBlk -box 11.2 164.07 95.005 319.205 -layer all -name BLK
deleteRouteBlk -name BLK
```

- The following commands create a blockage on all metal layers and deletes it.

```
createRouteBlk -box 400 400 500 500 -layer all
deleteRouteBlk -box 400 400 500 500
```

- The following commands create a blockage on metal3 and deletes it.

```
createRouteBlk -box 400 400 500 500 -layer 3
deleteRouteBlk -box 400 400 500 500
```

deleteRoutingHalo

```
deleteRoutingHalo
[-help]
[-lithoHalo]
{-allBlocks | -block blockNameList | -cell cellNameList | -inst instanceName | -designHalo}
```

Deletes a routing halo for a blackbox, hard macro, or block-level design. Use this command after specifying a routing halo for a blackbox, hard macro, or block-level design. You can use the `addRoutingHalo` command to add routing halos.

Parameters

`-allBlocks`	Deletes the routing halo for all blocks and black boxes. *Data_type*: bool, required
`-block` *blockNameList*	Deletes the routing halo for the specified blocks. *Data_type*: list, required
`-cell` *cellNameList*	Deletes the routing halo for the specified cells. *Data_type*: list, required
`-designHalo`	Deletes the routing halo at the design level. *Data_type*: bool, required
`-help`	Outputs a brief description that includes the type and default information for each `deleteRoutingHalo` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteRoutingHalo`
`-inst` *instanceName*	Specifies that the routing halo should be added to the specified instance. Use this option to delete the halo of an I/O pad instance. *Data_type*: list, required
`-lithoHalo`	Deletes the litho routing halo. *Data_type*: bool, optional

Example

- The following command delete the routing halo for all blocks and black boxes .
  ```
  deleteRoutingHalo -allBlocks
  ```

Related Information

- `addRoutingHalo`
- Floorplanning the Design chapter in the *Innovus User Guide*
- Floorplan Menu chapter in the *Innovus Menu Reference*

deleteRow

```
deleteRow
[-help]
{-all | -selected | -site string| row}
```

Deletes the specified row(s). Use this command after importing a design.

Parameters

`-all`	Specifies that all rows will be deleted. *Data_type*: bool, required
`-help`	Outputs a brief description that includes the type and default information for each `deleteRow` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteRow`
row	Specifies the name or id of the row(s) to be deleted. *Data_type*: list, required
`-selected`	Specifies that the selected rows should be deleted. *Data_type*: bool, required
`-site string`	Specifies the site for which rows will be deleted. *Data_type*: string, required

Example

The following command deletes rows for the site site0A10.

```
deleteRow -site site0A10
```

Related Information

- `select_row`
- `cutRow`
- Floorplanning the Design chapter in the *Innovus User Guide*
  - Creating and Editing Rows

deleteSelectedFromFPlan

```
deleteSelectedFromFPlan
[-help]
```

Deletes the currently selected floorplan objects. You can use this command at any point in the design flow.

Parameters

`-help`	Outputs a brief description of the `deleteSelectedFromFPlan` command. For a detailed description of the command, use the man command: `man deleteSelectedFromFPlan`

Related Information

- `deleteAllFPObjects`
- Floorplanning the Design chapter in the *Innovus User Guide*

deleteSizeBlockage

```
deleteSizeBlockage
[-help]
[-name blockageName]
[-selected]
[-all]
```

Deletes a size blockage object. You can use this command after resizing the floorplan.

Parameters

`-all`	Deletes all the size blockages. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `deleteSizeBlockage` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteSizeBlockage`
`-name blockageName`	
	Specifies the name of the size blockage that is to be deleted. *Data_type*: string, optional
`-selected`	Deletes the selected size blockage. *Data_type*: bool, optional

Example

- The following command creates a size blockage and deletes it:

```
addSizeBlockage -name sizeBlkg1 -box 400 400 500 500
deleteSizeBlockage -name sizeBlkg1
```

Related Information

deselectAll

```
deselectAll
[-help]
```

Deselects all selected nets. Once the nets are deselected, they are no longer highlighted in the design display window. Use this command after selecting one or more nets.

Parameters

`-help`	Outputs a brief description of the `deselectAll` command. For a detailed description of the command, use the man command: `man deselectAll`

Related Information

- `selectNet`
- Floorplanning the Design chapter in the *Innovus User Guide*

deselectGroup

```
deselectGroup
groupName
[-help]
```

Deselects a group. Use this command after selecting a group.

Parameters

groupName	Specifies the name of the group. *Data_type*: string, required
-help	Outputs a brief description that includes the type and default information for each `deselectGroup` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deselectGroup`

Related Information

- `selectGroup`
- Floorplanning the Design chapter in the *Innovus User Guide*

deselectInst

```
deselectInst
[-help]
instName
```

Deselects the specified instance. Once an instance is deselected, it is no longer highlighted in the design display window. Use this command after selecting one or more instances.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `deselectInst` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deselectInst`
`instName`	Specifies the name(s) of the instance(s). *Data_type*: (inst)+, required

Examples

- The following command deselects the inst named inst_1:
  ```
  deselectInst inst_1
  ```
- The following command deselects the insts named inst_2 and inst_3:
  ```
  deselectInst {inst_2 inst_3}
  ```

Related Information

- `selectInst`
- Floorplanning the Design chapter in the *Innovus User Guide*

deselectInstByCellName

```
deselectInstByCellName
[-help]
cellName
```

Deselects an instance by cell name. Use this command after selecting an instance by cell name.

Parameters

cellName	Specifies the name of the cell. *Data_type*: (libCell/ptnCell|vCell|topCell)+, required
-help	Outputs a brief description that includes the type and default information for each `deselectInstByCellName` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deselectInstByCellName`

Related Information

- `selectInstByCellName`
- Floorplanning the Design chapter in the *Innovus User Guide*

deselectInstOnNet

```
deselectInstOnNet
[-help]
netName
```

Deselects an instance on a net. Use this command after selecting an instance on a net.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `deselectInstOnNet` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deselectInstOnNet`
netName	Specifies the name of the net. *Data_type*: (net)*, required

Related Information

- `selectInstOnNet`
- Floorplanning the Design chapter in the *Innovus User Guide*

deselectIOPin

```
deselectIOPin
[-help]
pinName
```

Deselects an I/O pin. Use this command after selecting an I/O pin.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `deselectIOPin` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deselectIOPin`
pinName	Specifies the name of the I/O pin. *Data_type*: string, required

Related Information

- `selectIOPin`
- Floorplanning the Design chapter in the *Innovus User Guide*

deselectNet

```
deselectNet
[-help]
[netName]
[-clock | -nonDefaultRule | -shield ]
```

Deselects the specified net. Once a net is deselected, it is no longer highlighted in the design display window. Run this command after selecting one or more nets.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `deselectNet` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deselectNet`
netName	Specifies the name of the net you want to deselect. You cannot specify more than one net. You can, however, use a wild card (*). *Data_type*: (net)*, optional
`-clock`	Deselects all nets that have a DEF attribute + USE CLOCK. *Data_type*: bool, optional
`-nonDefaultRule`	Deselects all nets that have a DEF attribute + NONDEFAULTRULE. *Data_type*: bool, optional
`-shield`	Deselects all nets that have a DEF attribute + SHIELDNETS. *Data_type*: bool, optional

Examples

- The following command deselects the net named net_1:
  ```
  deselectNet net_1
  ```
- The following command deselects all clock nets:
  ```
  deselectNet -clock
  ```

Related Information

- `deselectAll`
- `selectNet`
- Floorplanning the Design chapter in the *Innovus User Guide*

display_obj_connectivity

```
display_obj_connectivity
[-help]
[-direction {in|out|all}]
[-level level]
[-line_to_ports]
[-min_connection number]
{-insts string | -ports string | -selected | -reset }
[-through_registers [-all_registers ]]
```

Displays the connections of specified macros, selected macros, or specified ports. You can also display the input and output connectivity separately. By default it displays both.

Parameters

`-all_registers`	Displays all registers found during the analysis, even those which do not drive to other macros. **Note:** This parameter must be used with the `-through_registers` option. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `display_obj_connectivity` parameter. For a detailed description of the command and all of its parameters, use the man command: `man display_obj_connectivity`
`-direction {in|out|all}`	Specifies the pin direction of objects to be displayed. *Default*: `all` *Data_type*: string, optional
`-insts string`	Specifies the macros for which the connectivity is displayed. *Data_type*: string, optional
`-level level`	Specifies the trace level to display. *Maximum Level*: 10 *Minimum Level*: 1 *Default*: 1 *Data_type*: int, optional
`-line_to_ports`	Displays the display paths from/to primary ports. *Data_type*: bool, optional
`-min_connection number`	Specify the trace minimum connection. *Default*: 1 *Data_type*: int, optional
`-ports string`	Specifies the IO ports for which the connectivity is displayed. *Data_type*: string, optional
`-reset`	Clears the trace macro display. *Data_type*: bool, optional
`-selected`	Displays the connectivity of selected macros. *Data_type*: bool, optional
`-through_registers`	Displays the flight lines going through registers. *Data_type*: bool, optional

Example

The following command displays the connections for blk1 upto level 3:

```
trace_obj_connectivity -insts blk1 -level 3
```

Related Information

- `trace_obj_connectivity`
- `set_trace_obj_connectivity_mode`
- `get_trace_obj_connectivity_mode`

exportNdr

```
exportNdr
[-help]
ndrRuleName
{-def defFileName | -lef lefFileName}
```

Exports/saves the new rule that was created with the `add_ndr` command into a LEF/DEF file. You can use this command after creating a non-default rule.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `exportNdr` parameter. For a detailed description of the command and all of its parameters, use the man command: `man exportNdr`
ndrRuleName	Specifies the name of a non-default rule. *Data_type*: string, required
`-def defFileName`	
	Specifies the name of a DEF file, to which the non-default rule is exported. *Data_type*: string, required
`-lef lefFileName`	
	Specifies the name of a LEF file, to which the non-default rule is exported. *Data_type*: string, required

Example

The following command exports the non-default rule, testndr to the LEF file, all.lef.

```
exportNdr testndr -lef all.lef
```

[-area {x1 y1 x2 y2}]
[-namePrefix name] }
```

Performs advanced placement-related refinements to a floorplan, to produce a more polished floorplan. The `finishFloorplan` command, can be used on any floorplan, including third-party generated floorplans. You can use the `setFinishFPlanMode` command to set the active objects and specify the channel direction for the `finishFloorplan` command to use. The `setFinishFPlanMode` parameters affects the behavior the `finishFloorplan` command.

Note: You can access the functionality of the `finishFloorplan` command using the `finishFPlan` alias.

Note: The `finishFloorplan` command honors the settings of the `-no_cut_row` parameter of the `setFPlanMode` command that specifies if rows are not required to be cut before other operations. When the `-no_cut_row` parameter is disabled, the `finishFloorplan` command adds blockages around the current row/non-row area in the design when the "`-activeObj row`" or "`-drcRegionObj nonRowArea`" options of the `setFinishFPlanMode` command are set. If rows are not cut before other operations but the `-no_cut_row` parameter is enabled, the `finishFloorplan` command can work as cut row flow to add blockages around row/non-row area which satisfy row constraints.

Parameters

`-addBoundaryBlockage`	Adds boundary routing blockages with "BOUNDARYBLOCKAGE" property around active object boundary. This parameter can only work with die as an active object. For each layer, boundary blockage is perpendicular to the preferred routing direction. *Data_type*: bool, optional

`-addBoundaryEOLBlockage`	Adds end-of-line(EOL) routing blockages with "COREEOLBLOCKAGE" property around active object boundary. This parameter can only work with rows as active objects. For each layer, EOL routing blockage is perpendicular to the preferred routing direction.
	Note: A Core EOL blockage rule is used to specify line-end blockages formed from the core edges. The EOL Blockage is defined in LEF as below:
	`PROPERTY LEF58_COREEOLBLOCKAGE "COREEOLBLOCKAGE outwardSize inwardSize [SIDEEXTENSION sideExtension] ;" ;`
	`COREEOLBLOCKAGE outwardSize inwardSize SIDEEXTENSION sideExtension`
	Defines the line-end blockages formed from the core edges in the orthogonal direction of the preferred routing direction of the layer of a design. The blockage is formed by going outward from the core by outwardSize and inward by inwardSize. If SIDEEXTENSION is defined, the blockage is extended by sizeExtension along the direction of the core edge on both sides. These blockages prevent any line-end of a wire end inside it. If a wire goes through the blockage and just touches the far end edge, it is still a violation. If a wire just touches an edge without extending inside the blockage, it is fine. .
	Data_type: bool, optional

`-addCornerBlockage x y`	Specifies the width and height of the hard placement blockage that is automatically added around the corner. Example: `finishFloorplan -addCornerBlockage 50 50` Before： After：  *Data_type*: string, optional
`-addHalo width`	Adds halo of the specified width. *Data_type*: float, optional
`-addRowBasedRegionBlockage`	When specified, it adds row based region blockages. This parameter adds region layer blockages with “ROWBASED” property in some row areas. **Note:** The row area is determined by standard cells with both such row sites and OBS on the region layer. *Data_type*: bool, optional
`-area {x1 y1 x2 y2}`	Specifies the lower left x coordinate, lower left y coordinate, upper right x coordinate, and upper right y coordinate respectively of the blockage area. *Data_type*: box, optional

`-autoHalo`	Automatically adds halos around every macro in design. For each macro edge, the halo thickness is proportional to pin density on that edge. Example: `finishFloorplan -autoHalo` Before：  After：  *Data_type*: bool, optional

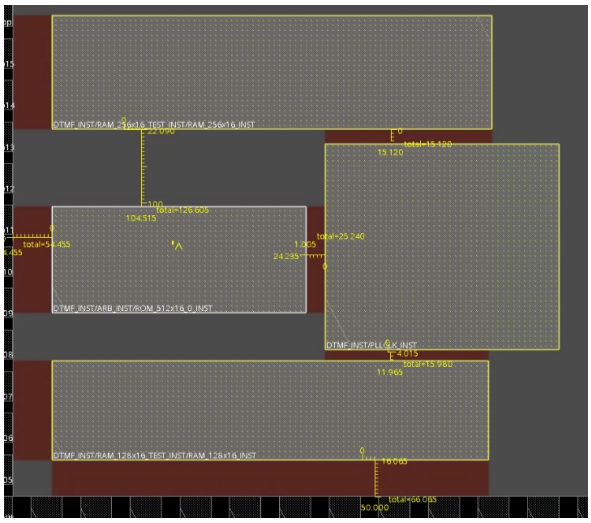
`-autoHaloBasedOnPitch`	Automatically add halos based on the number of pins, routing layer, and layer pitch on the edge. Example: `finishFloorplan -autoHaloBasedOnPitch` Before：  After：  *Data_type*: bool, optional
`-cutLayer` *cutLayerID*	Specifies the cut layer ID on which the routing blockage is to be applied. *Data_type*: string, optional

`-deadArea` *float*	Specifies the maximum value of dead area.
	Note: A dead area is an island with placeable rows that has a narrow channel connect to main core area. For example, the placeable rows surrounded by macros.
	Example：
	`finishFloorplan -fillPlaceBlockage hard 300`
	 	`finishFloorplan -fillPlaceBlockage hard 300 -deadArea 90000`
	 	Data_type: float, optional

`-density` *value*	Specifies the density of the partial placement blockage. *Data_type*: string, optional

`-designRuleWidth width`	Specifies the effective width of the routing blockage. The value is a real number greater than 0. *Data_type*: float, optional
`-drcRegionLayer layer+`	Specifies the region layer name list. *Data_type*: string, optional
`-edgeExtend {x y}`	Specifies that the DRC region can be extended from the specified edge. The `-edgeExtend` parameter is used for creating DRC region blockages by extending from the specified drcRegion objects. **Note:** • The specified value for option `-edgeExtend` should be equal to or greater than zero. If the specified value is less than zero, treat it as zero. • For X/Y direction, if the `-edgeExtend` and `-edgeShrink` options are specified at the same time, then Innovus compares the value first and then extends or shrinks. Example, `-edgeExtend {3 4}` and `-edgeShrink {2 5}` are specified at the same time, tool will extend 1(3-2) in X-direction and Shrink 1(5-4) in Y-direction. Example: `setFinishFPlanMode -drcRegionObj hardBlkg` `finishFloorplan -drcRegionLayer R1 -edgeExtend {50 100}`  *Data_type*: point, optional

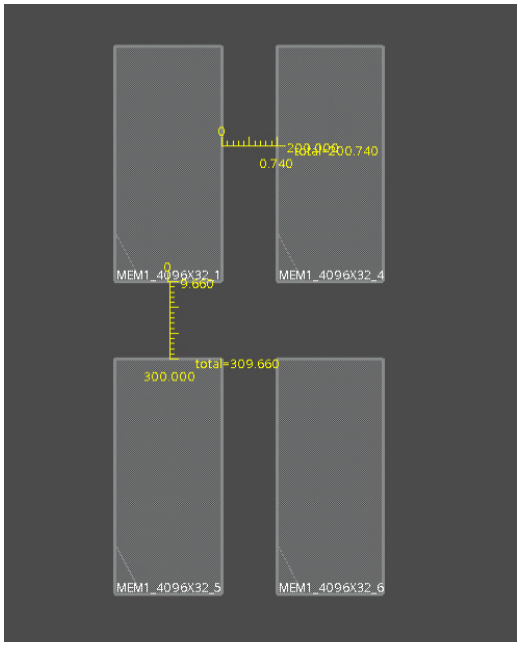
`-edgeShrink {x y}`	Specifies that the DRC region can be shrunk from the specified edge. The `-edgeShrink` parameter is used for creating DRC region blockages by shrinking the specified drcRegion objects. **Note:** • The specified value for option `-edgeShrink` should be equal to or greater than zero. If the specified value is less than zero, treat it as zero. • For X/Y direction, if the `-edgeExtend` and `-edgeShrink` options are specified at the same time, then Innovus compares the value first and then extends or shrinks. Example, `-edgeExtend {3 4}` and `-edgeShrink {2 5}` are specified at the same time, tool will extend 1(3-2) in X-direction and Shrink 1(5-4) in Y-direction. Example: `setFinishFPlanMode -drcRegionObj hardBlkg` `finishFloorplan -drcRegionLayer R1 -edgeShrink {50 100}`  *Data_type*: point, optional
`-exceptpgnet`	Specifies that the routing blockage is to be applied on a signal net routing and not on power or ground net routing. *Data_type*: bool, optional
`-excludeFlops`	Specifies that flops and latches will be excluded from the partial placement blockage. **Note**: The `-density` and `-excludeFlops` options must be used with the `-fillPlaceBlockage` parameter. *Data_type*: bool, optional
`-fillPlaceBlockage blkgType maxGap`	
	Adds placement blockages of the specified blockage type (`blkgType`) to fill macro-to-macro, macro-to-boundary, macro-to-OBS, OBS-to-OBS, and boundary-to-OBS gaps up to a specified size (`maxGap`). • For `blkgType`, you can specify soft, hard, or partial. • For `maxGap`, specify a positive value, in microns. *Default*: `-autoPlaceBlockage` Example1: `finishFloorplan -fillPlaceBlockage hard 50`



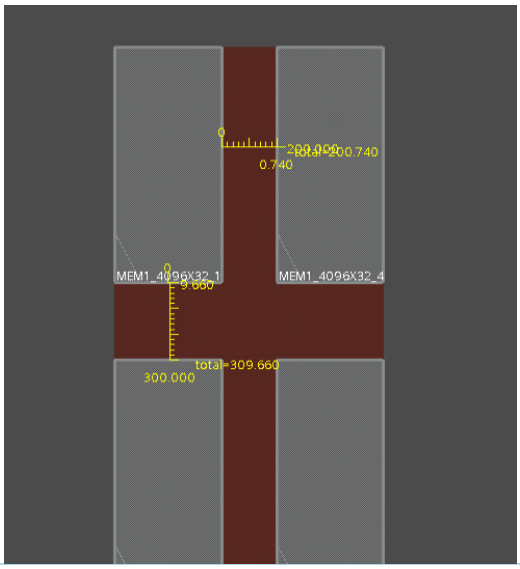
Example2: `setFinishFPlanMode -activeObj {macro hardblkg}`

`finishFloorplan -fillPlaceBlockage hard 300`

Before:

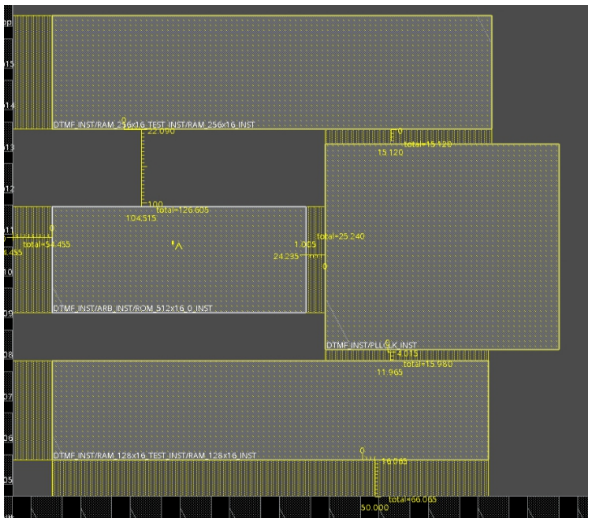


After:



`-fillRouteBlockage` *maxGap*

Adds routing blockage upto a specified size (maxGap)
Example: `finishFloorplan -fillRouteBlockage 50`



Data_type: float, optional

`-fills`

Specifies that the routing blockage is to be applied on metalfills.

Data_type: bool, optional

`-help`

Outputs a brief description that includes type and default information for each `finishFloorplan` parameter.

For a detailed description of the command and all of its parameters, use the man command:
`man finishFloorplan`.

`-honor_placement_density`	Adds standard cell density check when adding placement blockages. **Note:** • If option the `-density` parameter is not specified with the "`finishFloorplan -fillPlaceBlockage soft`" command, the density of the created soft blockage is 100. • If there are standard cells in the channel, partial blockages will be created with the density of the current standard cell in the channel when the following command is used: `finishFloorplan -fillPlaceBlockage hard/soft -honor_placement_density` • If there are standard cells in the channel and the specified density for the partial blockage is less than the density of the current standard cell in the channel, partial blockages will be created with the density of the current standard cell in the channel with the "`finishFloorplan -fillPlaceBlockage partial -density`" command. • If there are standard cells in the channel and the specified density for partial blockage is larger than the density of the current standard cell in the channel, partial blockages will be created with the specified density when the "`finishFloorplan -fillPlaceBlockage partial -density`" command is called. *Data_type*: bool, optional
`-layer` *layerID*	Specifies the layer ID of the route blockage. *Data_type*: string, optional
`-margin` *value*	Specifies the pitch margin when halos are added using `-autoHaloBasedOnPitch`. *Default*: `0.1` *Data_type*: float, optional

`-mask` *integer*	Specifies the mask number used when adding routing blockages and creating DRC region.
	• The `-mask` parameter enables the `finishFloorplan` command to block routing layers with specified masks when adding routing blockages and creating DRC region. Layers with other masks can still be routed through the blockage.
	• The `-mask` parameter must be used with one or more of `-layer`, `-cutLayer` and `-drcRegionLayer` parameters.
	• Only one mask can be specified. The default value of the `-mask` parameter is 0. This implies that all the specified layers will be blocked. Uncolored routes are always blocked.
	• If the `-mask` parameter is specified with an integer value greater than 0, then both layers with specified mask and uncolored layers are blocked.
	Example. If `-mask 1` is specified, it blocks mask 1 and uncolored routes.
	• If more than one layers are associated with a mask, the mask is applied to all of them.
	• If the `-mask` parameter is specified, the tool checks if the mask is suitable for all of the specified layers. If not, it displays an ERROR message and no blockages are created. The number of arguments specified with the –`mask` parameter must be same as the number of arguments specified with the `-layer`, `-cutLayer` and `-drcRegionLayer` parameters.
	• The `setNanoRouteMode` and `verify_drc` commands honor the `-mask` parameter.
	Example:
	• The following command creates routing blockages for blocking mask 2 of M1 layer.
	`finishFloorplan -layer M1 -mask 2 -fillRouteBlockage 400`
	• The following command(s) DRC region for mask 1 of PIO layer in core to die area.
	`setFinishFPlanMode -drcRegionObj {coreSpacing}`
	`finishFloorplan -drcRegionLayer PIO -mask 1 -edgeExtend {0.083 0}`
	Default: `0`
	Data_type: int, optional

`-namePrefix` *name*	Specifies the name prefix for the added blockage to avoid naming conflict with the existing one. *Data_type*: string, optional
`-spacing` *spaceValue*	Specifies the minimum spacing between layers within the routing blockage. The value is a real number greater than or equal to 0. *Data_type*: float, optional

`-undo`	Reverses the previous run of `finishFloorplan`. *Data_type*: bool, optional

Example

- The following command creates a dead area with partial placement blockage of gap of 5 microns and density 60:
  ```
  finishFloorplan -deadArea 100 -fillPlaceBlockage partial 5 -density 60
  ```

fix_boundary_overlaps

```
fix_boundary_overlaps
[-help]
[-move_area {x1 y1 x2 y2}]
[-groups {string1 string2 ...}]
[-hinsts {string1 string2 ...}]
[-fix_area {x1 y1 x2 y2}]
```

Resolves the overlaps between macros or hierarchical instances (hinsts). This command can also be used to resolve overlaps between instance groups.

Parameters

`-help`	Prints a brief description that includes type and default information for each `fix_boundary_overlaps` parameter. For a detailed description of the command and all of its parameters, use the man command: `man fix_boundary_overlaps`
`-fix_area {x1 y1 x2 y2}`	Specifies the coordinates of the area in which overlap needs to be resolved. *Data_type*: box, optional
`-groups {string1 string2 ...}`	Specifies the prefixed group names. Use this parameter if you want to resolve overlaps between only specified groups. *Data_type*: list, optional
`-hinsts {string1 string2 ...}`	Specifies the prefixed hinst names. Use this parameter if you want to resolve overlaps between only specified hinsts. *Data_type*: list, optional
`-move_area {x1 y1 x2 y2}`	Specifies the area where the floorplan objects can be moved when resolving overlaps. *Data_type*: box, optional

fix_floorplan

```
fix_floorplan
[-help]
-file fileName
-type {ufc tcic}
[-selected ]
[-report_file string]
[-report_unplaced_block ]
[-break_at_conflict ]
[-honor_snap_block_grid ]
[-selected_rules rule_name_list]
```

Fixes the detected violations as part of the UFC methodology by adding routing blockages around macro, snapping macro location, or re-shaping core shape. The UFC methodology also provides the capability to automatically fix the violations with imported UFC rules.

Note: The Unified Floorplan Constraints (UFC) methodology is a powerful Innovus capability that can define several rules on floorplan objects, check specified rules, and report the violations with rule name as well as severity. The violations can be shown in the violation browser. UFC also provides the ability to automatically fix specific violations. It can add routing blockages, snap macro location, adjust core shape to fix corresponding violations. In addition, UFC also provides the ability to exclude rules from checking for specified objects.

Usage Model:

- Load the Design.
- Create a UFC file with floorplan rules.
- Run UFC checking. (check_ufc)
- Fix reported violations. (fix_floorplan)

You can use the `fix_floorplan` command to fix the detected violations as part of the UFC methodology. It fixes violations by:

- Adding routing blockages around macros
- Snapping macro locations
- Re-shaping core shapes

The UFC methodology also provides the capability to automatically fix the violations with imported UFC rules.

Note: The `fix_floorplan` command tries to fix all the detected floorplan violations by default, however, it currently does not support fixing die size and core size violations. If a floorplan has rule conflicts, then the results after the fix may not be perfect. Cadence recommends you ensure that the rules used are not conflicting and that the die or core size satisfy the rules. Cadence also recommends you contact your Cadence representative if your constraints file comes from a third party, but you want to use the `fix_floorplan` command to fix the violations.

Note: The `fix_floorplan` command honors the `setFPlanMode -no_cut_row` parameter that specifies if rows are not required to be cut before operations. With `setFPlanMode -no_cut_row false` or not specified, the `fix_floorplan` command will work based on the current row shape. If there is any violation for rows, the `fix_floorplan` command will run the `cutRow` command to fix. With `setFPlanMode -no_cut_row true`, the tool identifies that the rows should not be cut. The `fix_floorplan` command will fix the row violations by adding place blockages instead of cutting row. The place blockages will be added to the row area that will be cut out and kept after fix_floorplan to satisfy the row constraint. The actual row shape will not be changed after the `fix_floorplan` command.

Parameters

`-break_at_conflict`	Enables the tool to exit from fixing violations when conflict of rules is encountered. You must fix the conflict of rules and then re-run the `fix_floorplan` command. *Data_type*: bool, optional
`-file` *fileName*	Specifies the name of file containing the rules or constraints. *Data_type*: string, required
`-help`	Prints a brief description that includes type and default information for each `fix_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man fix_floorplan`
`-honor_snap_block_grid`	When specified, the `fix_floorplan` command honors the block snap grid defined by the `setFPlanMode -snapBlockGrid` command. *Data_type*: bool, optional
`-report_file` *string*	Specifies the name of the file that saves the report summary. *Data_type*: string, optional
`-report_unplaced_block`	Enables the tool to show the number of unplaced macros in summary. *Data_type*: bool, optional
`-selected`	Specifies that only the selected objects can be moved to fix violations. **Note:** The `fix_floorplan` command currently only support selected macros. *Data_type*: bool, optional
`-selected_rules` *rule_name_list*	When specified, the `fix_floorplan` command only fixes violations for specified rules. The `-selected_rules` parameter accepts rule names, rule names list, variables, and wildcards. **Note:** When this option is not specified, the `fix_floorplan` command fixes all violations by default. *Data_type*: bool, optional
`-type {ufc tcic}`	Specifies the type of input file. The `fix_floorplan` command supports ufc and tcic files. *Data_type*: enum, required

Example

- The following command fixes the ufc violations based on the rules defined in the DTMF1.ufc file and writes the report to the fix_cmds.tcl file.
  ```
  fix_floorplan -type ufc -file DTMF1.ufc -report_file fix_cmds.tcl
  ```
- The following command fixes the ufc violations for Rule A and Rule B only.
  ```
  fix_floorplan -type tcic -file test.tcic -selected_rules "RuleA RuleB"
  ```

Related Information

- `check_ufc`
- Floorplanning the Design chapter in the *Innovus User Guide*

fixAllIos

```
fixAllIos
[-help]
[-pinOnly | -cellOnly | -incAreaIo]
```

Changes the status of all I/O pins, I/O cells, or CLASS PAD AREAIO cells to a FIXED state to keep them from being reassigned. Use this command after importing the design.

Parameters

`-cellOnly`	Changes the status of all I/O cells to a FIXED state. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `fixAllIos` parameter. For a detailed description of the command and all of its parameters, use the man command: `man fixAllIos`
`-incAreaIo`	Changes the status of all CLASS PAD AREAIO cells to a FIXED state. *Data_type*: bool, optional
`-pinOnly`	Changes the status of all I/O pins to a FIXED state. *Data_type*: bool, optional

Examples

- The following command changes the status of all I/O pins and I/O cells to a FIXED state:
  ```
  fixAllIos
  ```
  Note: This is the default functionality.
- The following command changes the status of all I/O pins to a FIXED state:
  ```
  fixAllIos -pinOnly
  ```
- The following command changes the status of all I/O cells to a FIXED state:
  ```
  fixAllIos -cellOnly
  ```
- The following command changes the status of all I/O pins, I/O cells, and all CLASS PAD AREAIO cells to a FIXED state:
  ```
  fixAllIos -incAreaIo
  ```

Related Information

- `unfixAllIos`
- Floorplanning the Design chapter in the *Innovus User Guide*.

flipModule

```
flipModule
[-help]
moduleName
{X | Y}
```

Flips all hierarchical instances in the specified module, with respect to the referenced X axis or Y axis of the module. Use this command after importing the design.

Parameters

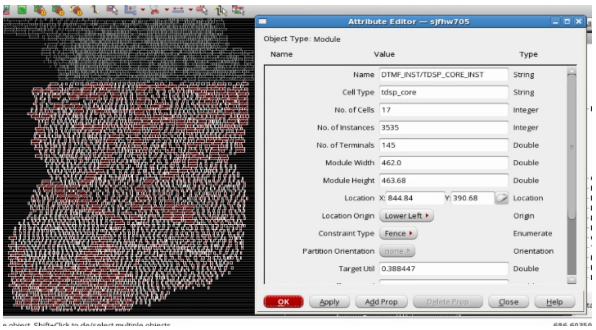
`-help`	Outputs a brief description that includes the type and default information for each `flipModule` parameter. For a detailed description of the command and all of its parameters, use the man command: `man flipModule`
`moduleName`	Specifies the name of the module whose hierarchical instances are to be flipped. *Data_type*: string, required
*`X	Y`*	Specifies the X or Y axis of the module to be used as a reference to flip all hierarchical instances. This referenced X or Y axis is normally at the center of the module. *Data_type*: enum, required

Example

The following command flips all hierarchical instances in the module DTMF_INST/TDSP_CORE_INST from the right side of the referenced Y axis to the left and from the left side to the right, and flips all instances mirrored through it's own Y axis as well.

flipModule DTMF_INST/TDSP_CORE_INST Y

Before:



After：

flipOrRotateObject

```
flipOrRotateObject
[-help]
[-keepRelative]
{-flip {MX | MY} | -rotate {R90 | R180 | R270}}
[-group]
[-name object]
```

Flips or rotates the selected objects. Alternatively, you can use the "*Flip/Rotate Selected Objects*" form in the Innovus GUI, to flip or rotate an instance. Use this command after importing the design.

Parameters

`-flip {MX | MY}`	
	Flips the selected object(s) through x axis or y axis. Example: `flipOrRotateObject -flip MX` Before:  After:  *Data_type*: string, required
`-help`	Outputs a brief description that includes the type and default information for each `flipOrRotateObject` parameter. For a detailed description of the command and all of its parameters, use the man command: `man flipOrRotateObject`

`-group`	Flips or rotates the bounding box which encloses all the selected objects. Example: `flipOrRotateObject -flip MX -group` Before:  After:  *Data_type*: bool, optional
`-keepRelative`	Calls the `create_relative_floorplan` command. With this option enabled, when the anchor objects are rotated, the relative objects are rotated and updated automatically. *Data_type*: bool, optional
`-name object`	Specifies the name of the object you want to flip or rotate. **Note**: The objects can be modules, groups, placement blockage, routing blockage, hard Macros, special routings, special wires, and special vias (including 45 degree). *Data_type*: string, required
`-rotate {R90|R180|R270}`	
	Rotates the selected object(s) by 90 or 180 or 270 degrees. *Data_type*: string, required

Example

The following command flips the selected object(s) through the x axis:

```
flipOrRotateObject -flip MX
```

floorPlan

```
floorPlan
[-help]
[-adjustToSite]
[-coreMarginsBy {io | die}]
[-dieSizeByIoHeight {min |max}]
[-flip {f | s | n}]
[-fplanOrigin {center | llcorner}]
[-noResize]
[-noSnapToGrid]
[-overlapSameSiteRow]
{-b {die_box io_box core_box} |
 -s {W H Left Bottom Right Top}  |
 -d {W H Left Bottom Right Top}  |
 -r {aspectRatio [rowDensity [Left Bottom Right Top]]}|
 -su {aspectRatio [stdCellDensity [Left Bottom Right Top]]}|
 -keepShape util}
[-site name | -siteOnly name]
```

Specifies the floorplan dimensions by size; or by die, I/O, or core coordinates. The `floorPlan` command initializes the floorplan and calls the `add_tracks` command to create new routing tracks. By default the `add_tracks` command calculates the optimum spacing between tracks and ignores the pitch values in the tech LEF. When you use the *Specify Floorplan* form (or specify the floorplan through the `floorPlan` command), the floorplan is resized automatically – relatively floorplan constraints are automatically derived on the fly for blocks, fixed standard cells, fixed pre-routes, and blockages.

The floorplan is linearly adjusted as follows:

- Spacing among blocks is evenly adjusted
- The size of the modules and black boxes is evenly adjusted.
- The fixed pre-routes and I/Os are automatically adjusted.

Note: The `floorPlan` command checks if the specified IO box and core box is within limits of die box and displays an error message if they are outside the die box.

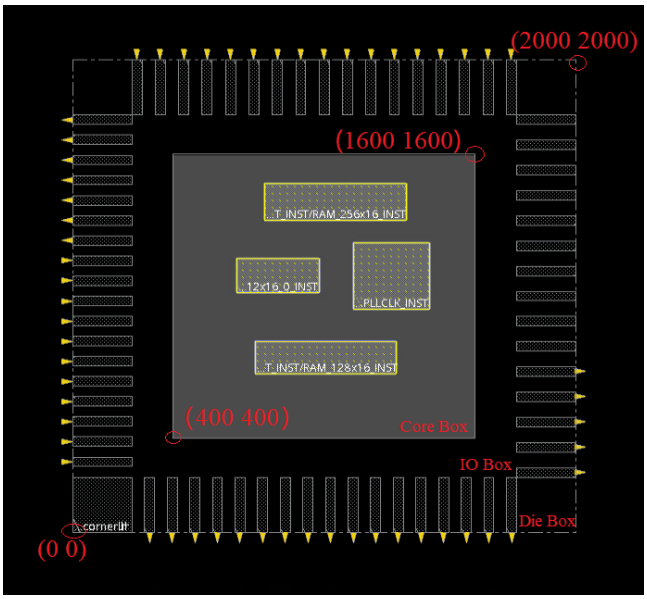
Parameters

`-adjustToSite`	Adjusts the width of the die area such that it is an integer multiple of the width of the IO site or core site. *Data_type*: bool, optional
`-b {die_box io_box core_box}`	

Specifies all three boxes of the floorplan, `die_box`, `io_box`, `core_box`.

The following command creates floorplan by specifying a core box size of 1200 x 1200,io box size of 1600 x 1600 and die box size of 2000 x 2000.

```
floorPlan -b {0 0 2000 2000 200 200 1800 1800 400 400 1600 1600}
```



Data_type: list, required

`-coreMarginsBy {io | die}`

Specifies whether the core margins are calculated using the core-to-IO boundary or the core-to-die boundary.

Default: `io`

Data_type: enum, optional

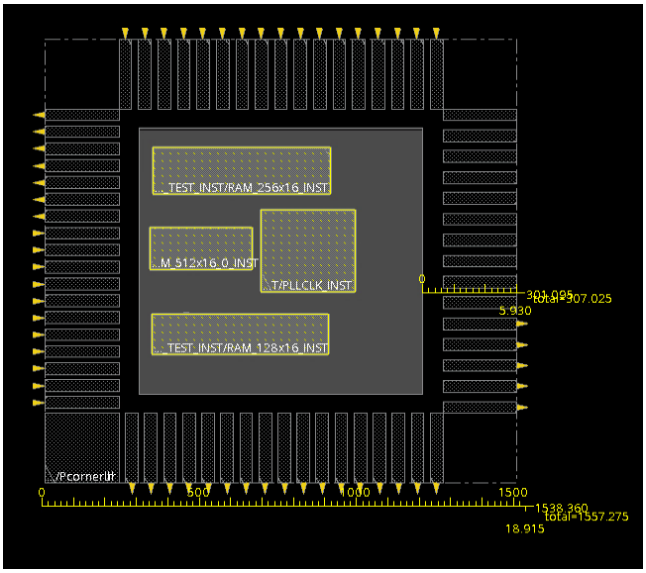
`-d {W H Left Bottom Right Top}`

Specifies the die size and the spacing, in micrometers, between the die edge, which is the margin between the outside edge of the die.

- *W* : Specifies the die's width value.
- *H* : Specifies the die's height value.
- *Left* : Specifies the margin from the outside edge of the core to the left of the I/O boundary.
- *Bottom* : Specifies the margin from the outside edge of the core to the bottom of the I/O boundary.
- *Right* : Specifies the margin from the outside edge of the core to the right of the I/O boundary.
- *Top* : Specifies the margin from the outside edge of the core to the top of the I/O boundary.

The following command creates floorplan by specifying a die box size of 1500 x 1500,and the spacing between core edge to each die edge of 300.

```
floorPlan -d {1500 1500 300 300 300 300}
```



Data_type: list, required

`-dieSizeByIoHeight {min | max}`

Specifies whether the maximum I/O height or the minimum I/O height should be used for die size calculation.

Default: `min`

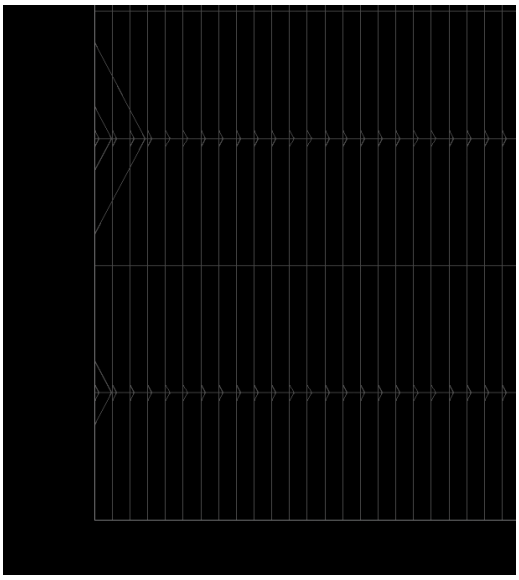
Data_type: enum, optional

`-flip {f | s | n}`

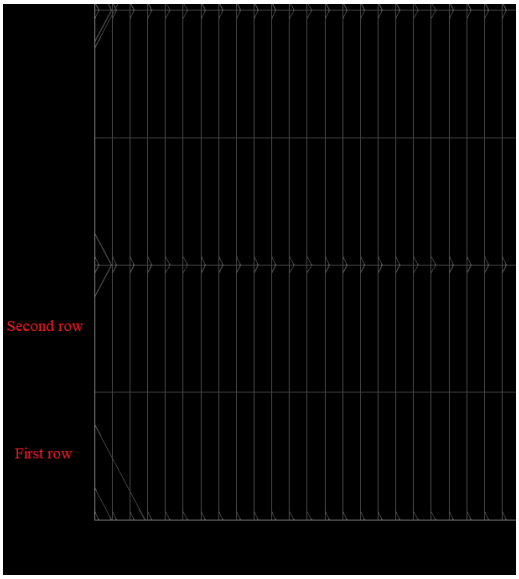
Specifies the orientation of the bottom row in the core area.

- `f`: Specifies that the first row flips from the bottom up.
- `n`: Specifies no row flipping.
- `s`: Specifies that the second row flips from the bottom up.

```
floorPlan -b {0 0 2000 2000 200 200 1800 1800 400 400 1600 1600} -flip f
```



```
floorPlan -b {0 0 2000 2000 200 200 1800 1800 400 400 1600 1600} -flip s
```



```
floorPlan -b {0 0 2000 2000 200 200 1800 1800 400 400 1600 1600} -flip n
```

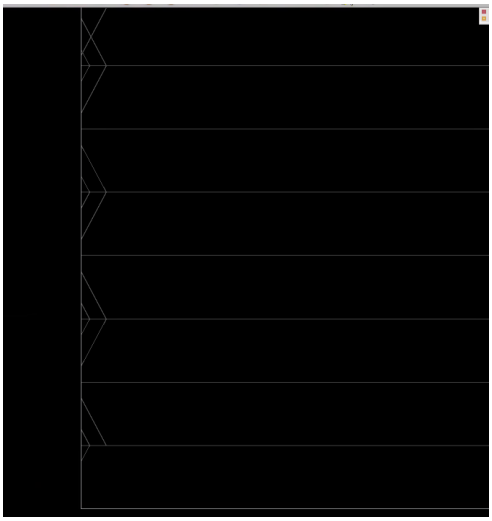
	`-fplanOrigin {center | llcorner}`	
	Specifies whether the origin of the floorplan should be at the center or at the lower left corner. *Default*: `llcorner` (lower left corner) *Data_type:* enum, optional
`-help`	Outputs a brief description that includes the type and default information for each `floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man floorplan`
`-keepShape` *util*	Specifies the target utilization after resize. *Data_type:* float, required
`-noResize`	Checks if there is a need to do floorplan if everything is the same. *Data_type*: bool, optional
`-noSnapToGrid`	Specifies that the core box (or die box) boundary will not be snapped to the nearest metal pitch even if the if the specified die/ core box size is not an integer multiple of the smallest metal pitch. This prevents the input floorplan boxes from being changed. *Data_type*: bool, optional
`-overlapSameSiteRow`	

Specifies that same-site rows can overlap with one another. Single height rows must not overlap. Only double or multiple-height rows can overlap, and in sections that are multiple of single height any other overlap section size will cause the rows to be ignored.

Example: `floorPlan -s {1000 1000 300 300 300 300} -overlapSameSiteRow`

Before:

After:



Data_type: bool, optional

`-r {aspectRatio [rowDensity [Left Bottom Right Top]]}`

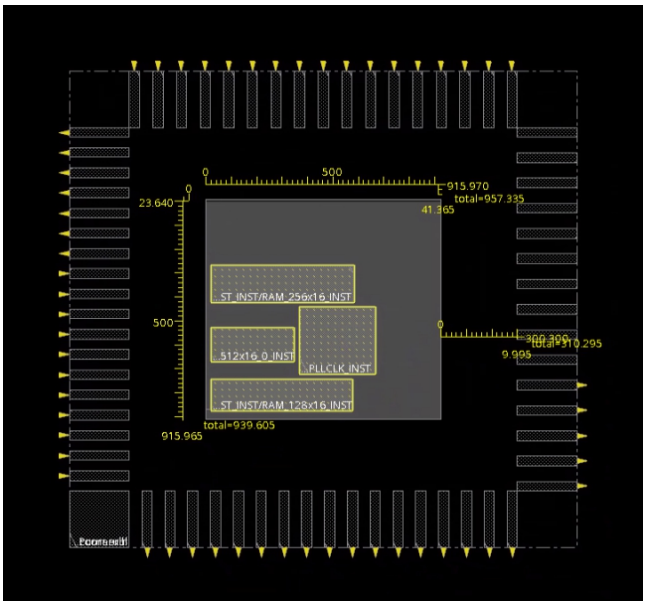
Specifies the chip's core dimensions as the ratio of the height divided by the width. If a value of 1.0 is used, a square chip is defined. A value of 2.0 will define a
rectangular chip with height dimension that is twice the width dimension.

- *aspectRatio*: Specifies the aspect ratio value.
- *rowDensity:* Specifies a row density value.

  ```
  rowDensity = (std area + block/macro area) / core area
  ```
- *Left*: Specifies the margin from the outside edge of the core box to the left.
- *Bottom*: Specifies the margin from the outside edge of the core box to the bottom.
- *Right*: Specifies the margin from the outside edge of the core box to the right.
- *Top*: Specifies the margin from the outside edge of the core box to the top.

The following command creates floorplan by specifying the core dimensions aspect ratio of 1.0,row density of 0.5,and the spacing between core edge to each io box edge of 300.

```
floorPlan -site tsm3site -r {1.0 0.5 300 300 300 300} -coreMarginsBy io
```



Data_type: list, required

-s {W H Left Bottom Right Top}

	Specifies the core size and the spacing, in micrometers, between the core edge, which is the margin between the outside edge of the core (head) box. • *W*: Specifies the core box's width value. • *H*: Specifies the core box's height value. • *Left*: Specifies the margin from the outside edge of the core box to the left. • *Bottom*: Specifies the margin from the outside edge of the core box to the bottom. • *Right*: Specifies the margin from the outside edge of the core box to the right. • *Top*: Specifies the margin from the outside edge of the core box to the top. The following command creates floorplan by specifying a core size of 1000 x 1000, and the spacing between core edge to each die edge of 300. `floorPlan -site tsm3site -s {1000 1000 300 300 300 300} -coreMarginsBy die`  *Data_type*: list, required
`-site` *name*	Specifies a core row site. *Data_type*: (site), optional
`-siteOnly` *name*	Creates rows only for the specified site. *Data_type*: (site), optional
`-su {`*aspectRatio* `[`*stdCellDensity* `[`*Left Bottom Right Top*`]]}`	

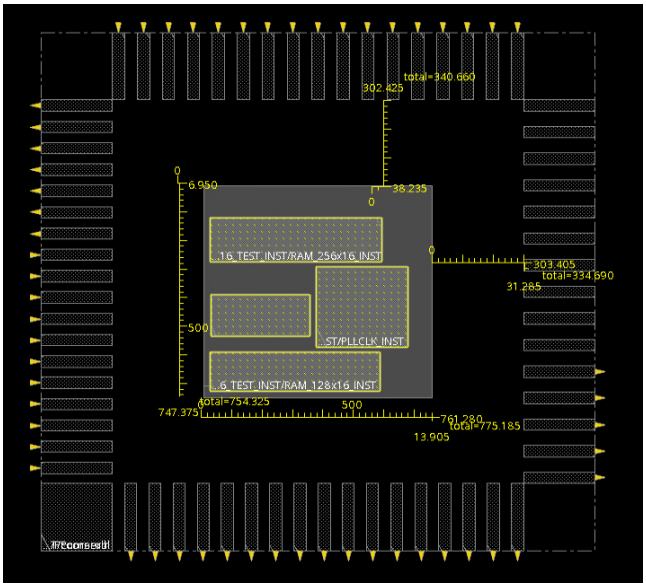
Determines the core and module sizes by standard cell density.

- *aspectRatio*: Specifies the aspect ratio value.
- *stdCellDensity*: Specifies a standard cell density value.

  ```
  stdCellDensity =  std cell area/(core area - block/macro area)
  ```
- *Left*: Specifies the margin from the outside edge of the core box to the left.
- *Bottom*: Specifies the margin from the outside edge of the core box to the bottom.
- *Right*: Specifies the margin from the outside edge of the core box to the right.
- *Top*: Specifies the margin from the outside edge of the core box to the top.

The following command creates floorplan by specifying the core dimensions aspect ratio of 1.0,standard cell density of 0.5,and the spacing between core edge to each io box edge of 300.

```
floorPlan -su {1.0 0.5 300 300 300 300}
```



Data_type: list, required

Examples

- The following command creates a new floorplan containing all the sites in the original floorplan

  ```
  floorPlan -s {...}
  ```
- The following command automatically shrinks or expands the block-level floorplan boundary, proportionally, in the X and Y directions, trying to meet the specified target core utilization 75.

  ```
  floorPlan -keepShape 75
  ```

generate_fence

```
generate_fence
[-help]
[-flow {2G}]
[-for_partition]
[-rectangle_shape]
[-target_util float]
[ [-hInst {hInst(s)}] | [-module {module(s)}] | [-inst_group {instGroup(s)}] ]
```

Automatically draws partition fences that enclose all their children FlexModel guides. It helps to improve the usability of the prototyping flow. The recommended use model for automatically generating fences is as follows:

1. Run `proto_design` to place FlexModel guides/fences.
2. Manually adjust/move FlexModels to shorten timing paths.
3. Run the following commands to analyze the floorplan and check timing. Repeat step 2 and 3 if needed
   a. `place_opt_design`
   b. `earlyGlobalRoute`
   c. `timeDesign -proto`
   d. `load_timing_debug_report -proto`
4. Select FlexModels for partitions and define partitions.
5. Run `generate_fence` to create fences that enclose all their children FlexModel guides.

Note: If no option is specified then the command draws fences for all existing defined partitions.

Parameters

`-flow {2G}`	Enables the Auto-Fence Generation 2G flow to draw the fence shapes automatically. When this flow is enabled, the mixed-placement capability is leveraged to give optimal module placement distribution. A fence is generated for each target module after considering target utilization, boundary gaps and I/Os. The Auto-Fence Generation 2G flow involves the following key steps:  • Running flat global mixed placement • Creating the fence based on the module cells placement distribution and control the utilization. • Polishing the fence so not to block any channel or I/O access *Data_type*: float, optional

`-for_partition`	When specified, it enables the partition fence generation capability. When this option is not specified, the power domain fence generation capability is enabled by default.  *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `generate_fence` parameter. For a detailed description of the command and all of its parameters, use the man command: `man generate_fence`
`-hInst {hInst(s)}`	Specifies the list of hierarchical instance names to draw fences. This option can be used if you only want to create a fence for a specific master or clone. You can use wildcards. **Note:** It can not be used for both master and clones. *Data_type*: string, optional
`-inst_group {instGroup(s)}`	Specifies list of instance group names to draw fences. You can use wildcards. *Data_type*: string, optional
`-module {module(s)}`	Specifies list of partition modules to draw fences. This option should be used for master/clone partitions. *Data_type*: string, optional
`-rectangle_shape`	When specified, only rectangle shaped fences are generated. *Data_type*: bool, optional
`-target_util string`	Specifies the fence target utilization value. *Default*: Core Utilization *Min*: 1e-07 *Max*: 1 *Data_type*: float, optional

Example

- The following command enables the auto-fence generation 2G flow and creates fences for the $PowerDomainNameList group.
  ```
  generate_fence -flow 2G -inst_group $PowerDomainNameList
  ```
- The following command enables the auto-fence generation 2G flow and creates fences for specified hierarchical instance(s).
  ```
  generate_fence -flow 2G -hInst $hInstNameList -for_partition
  ```

get_macro_place_constraint

```
get_macro_place_constraint
[-help]
[-macro_corner_keepout]
[[-array array_name] |
[-inst string  -orientation ] |
[-cell string  -cell_obs ] |
[-track_adjustment ] |
[-max_io_pin_group_keep_out ] |
[-forbidden_space_to_core ] |
[-forbidden_space_to_macro ] |
[-min_space_to_core ] |
[-min_space_to_macro ] |
[-parallel_run_length ] |
[-horizontal_stacking ] |
[-vertical_stacking ] |
[-honor_strict_spacing_constraint ] |
[-avoid_abut_macro_edge_with_pins ] |
[-same_length_site ] |
[-pg_resource_model ] |
[-non_default ] |
[-halo_sharing ]]
```

Gets the current value of the macro constraints that are honored by the macro placer. To define the constraints of macros, use the `set_macro_place_constraint` command.

Note: The report displayed when the -array, -cell/-cell_obs, or -inst/-orientation parameters are used can result in long lines on the screen that are supported by ellipses (…) indicating that more information about the macro constraint follows. If you want to get all the information together, Cadence recommends using the `write_macro_place_constraint` command to save all the information into a file.

Parameters

`-array` *array_name*	Specifies the macro array name. *Data_type*: string, optional
`-avoid_abut_macro_edge_with_pins`	When specified, it returns if abutting macro edges with pins must be avoided even if the macro distance is within the forbidden space setting. *Data_type*: bool, optional
`-cell_obs` *string*	When specified, it returns the cell obstruction value. *Data_type*: bool, optional
`-cell` *string*	Specifies constraints for all instances of the specified cells. *Data_type*: string, optional
`-forbidden_space_to_core`	When specified, it returns the forbidden space to core value. *Data_type*: bool, optional
`-forbidden_space_to_macro`	When specified, it returns the forbidden space to macro value. *Data_type*: bool, optional
`-halo_sharing`	When specified, it returns the halo sharing mode. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `get_macro_place_constraint` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_macro_place_constraint`

`-honor_strict_spacing_constraint`	When specified, it returns if the forbidden spacing and minimum spacing constraints must be honored strictly. *Data_type*: bool, optional
`-horizontal_stacking`	When specified, it returns the horizontal stacking constraint. *Data_type*: bool, optional
`-inst` *string*	Specifies the macros on which the constraints are set. *Data_type*: string, optional
`-macro_corner_keepout`	When specified, it returns the macro corner keepout value. *Data_type*: bool, optional
`-max_io_pin_group_keep_out`	When specified, it returns the max height of the I/O pin blockages. *Data_type*: bool, optional
`-min_space_to_core`	When specified, it returns the minimum space to core value. *Data_type*: bool, optional
`-min_space_to_macro`	When specified, it returns the minimum space to macro value. *Data_type*: bool, optional
`-non_default`	When specified, it displays the current settings which are not the default settings. *Data_type*: bool, optional
`-orientation`	When specified, it returns the valid orientations. *Data_type*: bool, optional
`-parallel_run_length`	When specified, it returns the parallel run length value. *Data_type*: bool, optional
`-pg_resource_model`	When specified, it returns the pg resource model details. *Data_type*: bool, optional
`-same_length_site`	When specified, it returns the the minimum number of sites between the vertical edge of two macros. *Data_type*: bool, optional
`-track_adjustment`	When specified, it returns the track adjustment value. *Data_type*: bool, optional
`-vertical_stacking`	When specified, it returns the vertical stacking constraint. *Data_type*: bool, optional

Example

- The following command gets the current value of the macro constraints that are honored by the macro placer.:
  ```
  get_macro_place_constraint
  ```

get_snap_grid_info

```
get_snap_grid_info
[-help]
[-origin]
[-pitch_x]
[-pitch_y]
-type {manufacturing | inst | placement | userdefine | layertrack | finfetInst |finfetmanufacturing | finfetplacement}
```

Gets information on the current snap grid settings.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `get_snap_grid_info` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_snap_grid_info`
`-origin`	Specify to get the original point of the grid. *Data_type*: bool, optional
`-pitch_x`	Specify to get the X-direction pitch of the grid. *Data_type*: bool, optional
`-pitch_y`	Specify to get the Y-direction pitch of the grid. *Data_type*: bool, optional
`-type {manufacturing | inst | placement | userdefine | layertrack | finfetInst |finfetmanufacturing | finfetplacement}`	
	Specify the grid type for which the information is required. The grid types can be: • `manufacturing`: Manufacture Grid • `inst`: Instance Grid • `placement`: Placement Grid • `userDefine`: User-defined Grid • `LayerTrack`: LayerTrack Grid • `finfetManufacturing`: FinFET Manufacture Grid • `finfetInst`: FinFET Instance Grid • `finfetPlacement`: FinFET Placement Grid *Data_type*: enum, required

Examples

The following commands displays the snap grid settings for the placement grid:
get_snap_grid_info -type placement

For example:

```
{origin {0.0000000000,0.0000000000}} {pitch_x 0.6600000000} {pitch_y 0.5600000000}
```

get_trace_obj_connectivity_mode

```
get_trace_obj_connectivity_mode
[-help]
[-macro_pins]
[-max_fanin_fanout]
[-register_inputs]
[-register_outputs]
[-quiet]
```

Returns information about the specified `set_trace_obj_connectivity_mode` parameter in the Innovus log file and the console. The following information is returned:

- Parameter name
- Current value
- Type (Boolean, string, and so on)
- Whether the current value was set by user

Note: If you do not specify a parameter, the software displays values for all of the `set_trace_obj_connectivity_mode` parameters.

You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_trace_obj_connectivity_mode` parameter. For a detailed description of the command and all of its parameters, use the man command: `man` get_trace_obj_connectivity_mode
`parameter_names`	Displays information for the specified parameters. You can specify one or more parameters. See `set_trace_obj_connectivity_mode` for descriptions of the parameters you can specify.
`-quiet`	Displays the current settings for the specified parameters in Tcl list format only.

Example

The following command displays the values for all of the `set_trace_obj_connectivity_mode` parameters:

```
get_trace_obj_connectivity_mode
```

getDrawView

```
getDrawView
[-help]
```

Returns the design view that was set with the `setDrawView` command. You can use this command after `setDrawView`.

Parameters

`-help`	Outputs a brief description of the `getDrawView` command. For a detailed description of the command, use the `man` command: `man getDrawView`

Related Information

- `setDrawView`
- Floorplanning the Design chapter in the *Innovus User Guide*

getFinishFPlanMode

```
  getFinishFPlanMode
[-help]
[-abuttedEdgeAsNonRowArea]
[-activeObj]
[-direction]
[-drcRegionObj]
[-override]
[-quiet]
```

Returns information about the specified `setFinishFPlanMode` parameter in the Innovus log file and the console. The following information is returned:

- Parameter name
- Current value
- Type (Boolean, string, and so on)
- Whether the current value was set by user

Note: If you do not specify a parameter, the software displays values for all of the `setFinishFPlanMode` parameters.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `getFinishFPlanMode` parameter. For a detailed description of the command and all of its parameters, use the man command: `man getFinishFPlanMode`.
`-parameter_names`	Displays information for the specified parameters. You can specify one or more parameters. See `setFinishFPlanMode` for descriptions of the parameters you can specify.
`-quiet`	Displays the current settings for the specified parameters in Tcl list format only.

Example

- The following command returns information about the `setFinishFPlanMode` parameters in the Innovus log file and the console:
  `getFinishFPlanMode`

Related Information

[-snapCoreGrid]
[-snapDieGrid]
[-snapIoGrid]
[-snapPlaceBlockageGrid]
[-snapPlaceBlockageType]
[-user_define_grid]
[-quiet]
[-nonDefault]
```

Returns information about the specified `setFPlanMode` parameter in the Innovus log file and the console. The following information is returned:

- Parameter name
- Current value
- Type (Boolean, string, and so on)
- Whether the current value was set by user

You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `getFPlanMode` parameter. For a detailed description of the command and all of its parameters, use the man command: `man getFPlanMode`
`parameters`	Returns information for the specified parameters. You can specify one or more parameters. See `setFPlanMode` for descriptions of the parameters you can specify.
`-quiet`	Displays the current settings for the specified parameters in Tcl list format only.

Related Information

- `setFPlanMode`
- `floorPlan`
- Floorplanning the Design chapter in the *Innovus User Guide*

getIoFlowFlag

```
getIoFlowFlag
[-help]
```

Gets the current I/O row flow flag setting. A value of "0" means traditional I/O flow where as a value of 1 means I/O row flow. To set the I/O row flow flag, use the `setIoFlowFlag` command.

Parameters

`-help`	Outputs a brief description of the `getIoFlowFlag` command. For a detailed description of the command, use the man command: `man getIoFlowFlag`

Example

- The following command displays the current I/O row flow flag settings:
  ```
  getIoFlowFlag
  ```

Related Information

  - Create I/O Row

getNetWeight

```
getNetWeight
[-help]
{-all | netName ... }
```

Retrieves the net weight values for the specified nets. You can use this command after running the `specifyNetWeight` command.

Parameters

`-all`	Retrieves the net weight value for all nets. *Data_type*: bool, required
`-help`	Outputs a brief description that includes the type and default information for each `getNetWeight` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man getNetWeight`
netName	Retrieves the net weight value for all specified nets. *Data_type*: string, required

Related Information

- `specifyNetWeight`
- `deleteNetWeight`
- Floorplanning the Design chapter in the *Innovus User Guide*

getObjFPlanBoxList

```
getObjFPlanBoxList
[-help]
type
name
```

Retrieves a box list of the specified rectilinear object that was created earlier with the `setObjFPlanBoxList` command. This command can also be used to retrieve a box list of a rectilinear block instance from the PEF overlap layer. A box list comprises two or more boxes. You can use this command after setting the rectilinear shape of a block instance with the `setObjFPlanBoxList` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `getObjFPlanBoxList` parameter. For a detailed description of the command and all of its parameters, use the man command: `man getObjFPlanBoxList`
name	Specifies the name of the object for object type. *Data_type*: string, required
type	Specifies the type of object (`Cell | Group | Instance | Layershape | Module | Net | Pin`) for name. *Data_type*: string, required

Example

The following command retrieves the rectilinear boundary for module xyz.

```
getObjFPlanBoxList Module xyz
```

Related Information

- `setObjFPlanBoxList`
- Floorplanning the Design chapter in the *Innovus User Guide*
  - Defining the Bounding Box

getObjFPlanPolygon

```
getObjFPlanPolygon
[-help]
type
name
```

Retrieves polygon coordinates of the specified rectilinear object that was created earlier with the `setObjFPlanPolygon` command. You can use this command after setting the polygon coordinates of a rectilinear block with the `setObjFPlanPolygon` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `getObjFPlanPolygon` parameter. For a detailed description of the command and all of its parameters, use the man command: `man getObjFPlanPolygon`
name	Specifies the name of the object for type. *Data_type*: string, required
type	Specifies the type of object for objectName. This can be: • Cell • Group • Instance • Layer shape • Module *Data_type*: string, required

Example

The following command retrieves the polygon coordinates of module xyz.

```
getObjFPlanPolygon module xyz
```

Related Information

- `setObjFPlanPolygon`
- Floorplanning the Design chapter in the *Innovus User Guide*

getRailPrototypeMode

```
getRailPrototypeMode
[-help]
[-domain]
[-railModel]
[-totalPower]
[-quiet]
```

Returns information about the specified `setRailPrototypeMode` parameter in the Innovus log file and the console. The following information is returned:

- Parameter name
- Current value
- Type (Boolean, string, and so on)
- Whether the current value was set by user

Note: If you do not specify a parameter, the software displays values for all of the `setRailPrototypeMode` parameters.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `getRailPrototypeMode` parameter. For a detailed description of the command and all of its parameters, use the man command `man getRailPrototypeMode`.
`-parameter_names`	Displays information for the specified parameters. You can specify one or more parameters. See `setRailPrototypeMode` for descriptions of the parameters you can specify.
`-quiet`	Displays the current settings for the specified parameters in Tcl list format only.

Related Information

- `setRailPrototypeMode`
- Floorplanning the Design chapter in the *Innovus User Guide*

getResizeFPlanMode

```
getResizeFPlanMode
[-help]
[-congAware]
[-honorHalo]
[-ioFix]
[-ioMoveWithEdge]
[-ioProportional]
[-maintainResourceRatioAfterResize]
[-proportional]
[-shiftBased]
[-shrinkFence]
[-snapToTrack]
[-quiet]
```

Returns information about the specified `setResizeFPlanMode` parameter in the Innovus log file and the console. The following information is returned:

- Parameter name
- Current value
- Type (Boolean, string, and so on)
- Whether the current value was set by user

Note: If you do not specify a parameter, the software displays values for all of the `setResizeFPlanMode` parameters.

You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `getResizeFPlanMode` parameter. For a detailed description of the command and all of its parameters, use the man command: `man getResizeFPlanMode`
parameter_names	
	Displays information for the specified parameters. You can specify one or more parameters. See `setResizeFPlanMode` for descriptions of the parameters you can specify.
`-quiet`	Displays the current settings for the specified parameters in Tcl list format only.

Related Information

- `resizeFloorplan`
- `setResizeLine`
- `setResizeFPlanMode`

  - Resizing the Floorplan

initCoreRow

```
initCoreRow
[-help]
[-powerDomain string]
```

Regenerates rows for the core area and the power domains in a design. The rows are based on the current row parameters instead of using the `floorPlan` command. You can use this command after importing the design.

Note: In a common flow, Innovus goes over all technical sites used in the netlist and creates rows for these sites. It chooses the shortest tech site in the design (with the smallest height and width) as the default-technical-site. All other used tech-sites with integer-multiple height/width are considered as compatible.

Parameters

`-help`	Outputs a brief description of the `initCoreRow` command. For a detailed description of the command, use the `man` command: `man initCoreRow`
`-powerDomain string`	Specifies the power domain for which rows are to be created. *Data_type*: string, optional

Related Information

- `floorPlan`
- Floorplanning the Design chapter in the *Innovus User Guide*

insert_physical_cell

```
insert_physical_cell
[-help]
[-cell string]
[-genTemplateOnly string]
[-inputFile filename]
[-insertRowAreaBoundary]
[-averageWindow | { [-insertNearBoundary ] [-box {x1 y1 x2 y2}] [-minimalNumberOfTCD integer]}]
[-verifyWindow {x y}[ [-verifyOnly ][-xStep float] [-yStep float] ] ]
```

Provides a flexible way to insert and check physical cells. It can be used to assign a specific area for physical insertion, not only the die area.

Note: The `insert_physical_cell` command is suitable for inserting physical cells as a pattern. The class of these cells must be block and not core. The `insert_physical_cell` command is not when the class of the physical cells is core and there is no requirement for inserting cells in a pattern.

Parameters

`-averageWindow`	When specified, it changes the window calculation approach to average. The size of windows for inserting cell is the average of the core box. The insertion will be done not exactly in accordance with the size defined in spec file.  Physical cells are inserted exactly according to the defined gridbox size. Do not averagely divide the window. Physical cells are averagely inserted, not exactly in accordance with the gridbox size defined in spec file. *Data_type*: bool, optional
`-box {x1 y1 x2 y2}`	Specify the bounding box of the physical cell in `x1 y1 x2 y2`. For example, the following command inserts the cell DTCDCELL in the (*x1 y1 x2 y2)* box. `insert_physical_cell -cell DTCDCELL -inputFile SPECFILE -box {x1 y1 x2 y2}`  *Data_type*: box, optional
`-cell string`	Specify the physical cell name. *Data_type*: string, optional

`-genTemplateOnly` *string*	Generates a template file to guide how to define spec file for DTCD, ICOVL and LinerCell. *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `insert_physical_cell` parameter. For a detailed description of the command and all of its parameters, use the man command: `man insert_physical_cell`

`-inputFile` *filename*	Specify the spec file for physical cells.
	Note: The inserted physical cells must be specified in a spec file. This file specifies the information related to the dimensions and spacing physical cells. The tool will insert physical cells according to these specifications.
	Here is an example of a spec file:
	`**********`
	`DTCD Cell cell_name`
	`WinSizeX  # x dimension of DTCD insertion grid box`
	`WinSizeY  # y dimension of DTCD insertion grid box`
	`MacroSpacing  # spacing between DTCD cell and macro`
	`DTCDSpacing  # spacing between DTCD cells`
	`PlaceBlockSizeX  # x dimension of padded placement blockage around DTCD cell`
	`PlaceBlockSizeY  # y dimension of padded placement blockage around DTCD cell`
	`RouteBlockSizeX  # x dimension of padded routing blockage around DTCD cell`
	`RouteBlockSizeY  # y dimension of padded routing blockage around DTCD cell`
	`End`
	`**********`
	Data_type: string, optional

`-insertNearBoundary`	Inserts physical cells near boundary.
	Note: When the window size is not exactly divided by gridbox size, you may not get physical cells near boundary.
	For example:
	`insert_physical_cell -cell DTCDCELL -inputFile SPECFILE`
	 	
	`insert_physical_cell -cell DTCDcell -inputFile SPECFILE -insertNearBoundary`
	 	
	Data_type: bool, optional

`-insertRowAreaBoundary`	Inserts LinerCell around row area boundary. *Data_type*: bool, optional

`-minimalNumberOfTCD` *integer*	Specifies the the minimal number of DTCD that must be inserted. If the current windows size definition (*WinSizeX* and *WinSizeY*) cannot fit this requirement, the window size is shrunk automatically. *Data_type*: int, optional

`-verifyOnly`	Only verifies the physical cells to inserted. It does not actually insert them.
	Note: The `-verifyWindow`, `-xStep`, and `-yStep` parameters are used to specify the size of the window to verify.
	For example:
	`insert_physical_cell -cell DTCDCELL -inputFile SPECFILE -verifyWindow 100 100 -xStep 100 -yStep 100 -verifyOnly`
	 	Only verify the physical cell in gridbox, do not insert.
	`insert_physical_cell -cell DTCDCELL -inputFile SPECFILE -verifyWindow 100 100 -xStep 100 -yStep 100`
	 	Verify and insert the physical cells
	Data_type: bool, optional

`-verifyWindow {x y}`	Specifies the size of window for verifying the physical cells to be inserted. *Data_type*: point, optional
`-xStep` *float*	Specifies the x step of the verify window. *Data_type*: float, optional
`-yStep` *float*	Specifies the y step of the verify window. *Data_type*: float, optional

Example

- The following command inserts the cell DTCDCELL in the *(x1 y1 x2 y2)* box based on the spec specified in the SPECFILE.
  `insert_physical_cell -cell DTCDCELL -inputFile SPECFILE -box {x1 y1 x2 y2}`
- The following command only verifies the cell DTCDCELL in the grid box. It does not insert the cell.
  `insert_physical_cell -cell DTCDCELL -inputFile SPECFILE -verifyWindow 100 100 -xStep 100 -yStep 100 -verifyOnly`

legalizeFPlan

```
legalizeFPlan
[-help]
[-checkOri]
[-checkSite]
```

Legalizes partition locations according to standard cell row orientations and specific design constraints. You can use this command after specifying the floorplan.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `legalizeFPlan` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man legalizeFPlan`
`-checkOri`	Specifies that all partitions snap to the closest `R0` row on the grid. For this rule, the Innovus software assumes that standard cell rows start with an `R0` orientation and continue in an `R0`-to-`MX` pattern. *Data_type*: bool, optional
`-checkSite`	Specifies that partitions be placed on grids so that they are legal for all design constraints. *Data_type*: bool, optional

Example

The following command legalizes all the partition locations such that they are snapped to the closest `R0` rows:

```
legalizeFPlan -checkOri
```

Related Information

- `checkFPlan`
- Floorplanning the Design chapter in the *Innovus User Guide*

loadFPlan

```
loadFPlan
file
[-help]
[-noEqualizePtnHInst]
[-objType {macro | pin | bndry | special_route | pin_constraint}]
[-xml]
```

Loads a floorplan file. You can use this command after importing the design.

Note:

- When you run the `loadFPlan` command, the Innovus software removes any existing floorplan information and reads in the new information. The `loadFPlan` command honors the blackbox min/max aspect ratio information in the floorplan information file.
- Blocks and instances loaded with this command are set as preplaced.
- The `loadFPlan` command loads the user-specified seed information by default.
- The `loadFPlan` command restores the information related to blockages, tracks, and pin shapes from the *.fp file.

Parameters

file	Specifies the name of the floorplan file that was saved. *Data_type*: string, required
-help	Outputs a brief description that includes type and default information for each `loadFPlan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man loadFPlan.`
-noEqualizePtnHInst	Disables the snapping capability of the clone partitions to the power grid, such that clones do not necessarily have the same row structure and pattern as their master. *Data_type*: bool, optional
-objType {macro | pin | bndry | special_route | pin_constraint}	
	Specifies the objects section in the floorplan file that will be updated. The sections can be macro, pin, bndry, special_route, or pin_constraint. **Note**: The `loadFPlan` command supports routing blockages on master slice layers. *Data_type*: string, optional
-xml	Reads the floorplan information from the XML format floorplan file. *Data_type*: bool, optional

Example

- The following command loads the floorplan file myFPlan.fp, which was saved in an earlier session:
  ```
  loadFPlan myFPlan.fp
  ```
- The following command loads only the pin constraints data in the present design with other floorplan objects remaining unchanged.
  ```
  loadFPlan myFPlan.fp -objType {pin_constraint}
  ```

Related Information

- saveFPlan

  - Viewing the Floorplan

loadIoFile

```
loadIoFile
[-help]
file_name
[-noAdjustDieSize]
[-specifiedIosOnly]
[-ECO [-padsOnly | -bumpsOnly]]
```

Loads an I/O assignment file. You can use this command after importing the design.

Notes:

- By default, the `loadIoFile` command will automatically adjust the die size to accommodate all the IOs. If this command is used after floorplanning, it would change the die size defined in the floorplan file. If you do not want the die size to be automatically adjusted, use the `-noAdjustDieSize` parameter.
- During I/O inst placement, the *space* value determines the distance between the current inst and the previous inst. Earlier, while honoring `iopad` spacing, the `loadIoFile` command considers the previous inst to be the inst that appears before the current inst when insts are placed according the io_order specified in the I/O assignment file .

Parameters

`-bumpsOnly`	Loads only bump ECO operations in specified IO file. *Data_type*: bool, optional
`-ECO`	Allows I/O ECO change by loading a new I/O file. In a chip-package co-design situation, when I/O Planner (IOP) utility in SiP is used for modifying the I/O and bump information, the modified information needs to be passed to Innovus. When `-ECO` is specified, `loadIoFile` overwrites the existing setting for I/Os and bumps with the information from the new I/O file. *Data_type*: bool, optional
file_name	Specifies the name of the I/O assignment file. *Data_type*: string, required
`-help`	Outputs a brief description that includes the type and default information for each `loadIoFile` parameter.For a detailed description of the command and all of its parameters, use the `man` command: `man loadIoFile`
`-noAdjustDieSize`	Specifies that the die size should not be adjusted automatically. *Data_type*: bool, optional
`-padsOnly`	Loads only IO pad ECO operations in the specified IO file. *Data_type*: bool, optional
`-specifiedIosOnly`	Loads only the IO in the specified IO file. This parameter enables you to place IO cells listed in the I/O assignment file without deleting or moving the IO cells not listed in I/O assignment file. *Data_type*: bool, optional

Example

The following command loads the I/O assignment file `myPinFile.io`:

```
loadIoFile myPinFile.io
```

modify_ndr

```
modify_ndr
[-help]
[-add_via {via_name1 via_name2 ...}]
[-generate_via]
[-hard_spacing {0|1}]
[-min_cut {layer1[:layer2] min_cut ...}]
-name ruleName
[-spacing {layer1[:layer2] spacing ...}]
[-use_via_cut_class string]
[-via {via_name1 via_name2 ...}]
[-width {layer1[:layer2] width ...}]
```

Modifies a non-default rule created by the add_ndr command, or coming in from DEF or the OpenAccess design data.

Note: Any NONDEFAULTRULE defined in LEF or the OA techfile cannot be modified by this command. You must modify the LEF or OA techfile directly if you need to change them.

This command should normally be used before any routing exists in the design. If there is any existing routing using this NDR, then the changes may cause new DRC violations. In some cases ecoRoute may be able to repair the routing (for example just changing the vias can often be repaired, and just adding new via choices should not need any repair), but in many cases you will need to reroute the entire design (e.g. when changing the width or spacing) to get good results.

If `setGenerateViaMode -auto` is `true`, then vias are automatically generated for the modified NDR based on the `setGenerateViaMode` settings. See the `setGenerateViaMode` command for more details.

Parameters

`-help`	Prints a brief description that includes type and default information for each `modify_ndr` parameter. For a detailed description of the command and all of its parameters, use the man command: `man modify_ndr`
`-add_via {`*`via_name1 via_name2 ...`*`}`	
	Specifies a list of vias to add to the existing NDR via list. You can use this parameter to add DFM vias or other custom vias.
`-generate_via`	Auto-generates vias with the generateVias command. This is intended for debugging, and not used generally as it only adds vias for the current session. If you save, and later restore the design in a new session, the added vias are not added to the NDR via list any longer. You can use this option to do experiments in the current session, or write out a LEF or DEF file to put the modified NDR into the LEF or OA techfile. **Note:** If setGenerateViaMode -auto is true, then vias are always auto-generated even when -generate_via is not given. This is the normal usage behavior if you want to use the auto-generated vias for the rest of the flow (e.g. after save, and then restoring the design in a new session).
`-hard_spacing {0|1}`	Sets the non-default rule as HARDSPACING.
`-min_cut {`*`layer1`*`[:`*`layer2`*`] `*`min_cut ...`*`}`	
	Specifies the minimum cut limit for via layers.
`-name `*`ruleName`*	Specifies the name of the non-default rule to be modified.
`-spacing {`*`layer1`*`[:`*`layer2`*`] `*`spacing ...`*`}`	
	Specifies the spacing for the routing layers.
`-use_via_cut_class `*`string`*	Specifies the layer and `cut_class` list to support the LEF/DEF property. The value must be given in the format of either `{layer cut_class}` or `{layer cut_class nr_row nr_col}`. Refer to the examples below: modify_ndr -name new_1 -use_via_cut_class {V1 VX} modify_ndr -name new_2 -use_via_cut_class {V1 VX 2 1}
`-via {`*`via_name1 via_name2 ...`*`}`	
	Resets the via list to empty, and then adds the list of named vias to the NDR via list.
`-width {`*`layer1`*`[:`*`layer2`*`] `*`width ...`*`}`	
	Specifies the width for the routing layers.

Examples

- The following command creates a rule that requires double width and double spacing. All other values are the same as the default rule. `add_ndr` is like modify_ndr for via generation. If `setGenerateViaMode -auto` is true, then vias are automatically generated that match the different layer widths. If not, the vias from the default rule are used, which is not correct for wires that are twice the default width.
  ```
  add_ndr -name NDR_2w2s -spacing {metal1:metal4 0.2 metal5:mmetal6 0.4 metal7 0.6} -width {metal1:metal4 0.2 metal5:metal6 0.4 metal7 0.6}
  ```
- The following command modifies the width and spacing values in non-default rule NDR_2w2s created by the command. above. If `setGenerateViaMode -auto` is true, vias are automatically generated with matching widths and added to the NDR via-list. If not, then the original vias are not changed, which can be wrong for different widths.
  ```
  modify_ndr -name NDR_2w2s -spacing {metal1:metal4 0.4 metal5:metal6 0.8 metal7 0.9} -width {metal1:metal4 0.4 metal5:metal6 0.8 metal7 0.9}
  ```
- The following command auto-generates vias for rule NDR_2w2s with the `generateVias` command to get vias that match the wider wire widths, even if `setGenerateViaMode -auto` is false. This is only useful for debugging in the current session, or to write a LEF file with the NDR to add back into the LEF or OA techfile. If you want to use the auto-generated vias for the rest of the flow, you should set `setGenerateViaMode` -auto to true.
  ```
  modify_ndr -name NDR_2w2s -generate_vias
  ```
- The following command modifies existing rule NDR_2w2s to specify MINCUTS to 2 for the Vx layers (via1 to via3).
  ```
  modify_ndr -name NDR_2w2s -min_cut {via1:via3 2}
  ```

move_obj

```
  move_obj
[-help]
[-group]
{ -point {x y} | { -direction {up down left right} { -distance value | -to {core_box die_box} }}}
{ obj_list | -selected }
```

Moves objects (instances, modules, groups, placement blockage, routing blockage, hard macros, special routings, and I/O pins) vertically or horizontally by a specified distance. The objects can be moved to the die or core box boundary, as specified. You can use this command after selecting one or more objects in the design display area.

Parameters

`-direction {up down left right}`	
	Specifies the vertical and horizontal movement for the selected objects. Choose one of the following: • `up`: Specifies an upward move. • `down`: Specifies a downward move. • `left`: Specifies a left move • `right`: Specifies a right move. *Data_type*: enum, optional
`-distance` *value*	Specifies the distance, in micrometers, that the objects will be moved in the specified direction. *Data_type*: float, optional
`-group`	Moves all the specified or selected objects as a group. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `move_obj` parameter. For a detailed description of the command and all of its parameters, use the man command: `man move_obj`
obj_list	Specifies the list of objects to move. *Data_type*: (any_object)+, optional
`-point {`*x y*`}`	Specifies the lower left point that the objects will be moved to. *Data_type*: point, optional
`-selected`	Moves the selected object. *Data_type*: bool, optional
`-to {core_box die_box}`	
	Moves the object to the core_box or the die_box boundary, as specified. *Data_type*: enum, optional

Examples

- The following command moves each of selected objects to the left of core boundary:
  ```
  move_obj -selected -direction left -to core_box
  ```
- The following command moves the bounding box of all selected objects to the left of core boundary:
  ```
  move_obj -selected -direction left -to core_box -group
  ```
- The following command moves each of the selected objects to the left with 50um. The same as with option -group:
  ```
  move_obj -selected -direction left -distance 50
  ```
- The following command moves each of the selected objects' low left coordinates to the specified point:
  ```
  move_obj -selected -point {330 410}
  ```
- The following command moves the bounding box's low left coordinates of all selected objects to the specified point:
  ```
  move_obj -selected -point {330 410} -group
  ```

moveGroupPins

```
moveGroupPins
[-help]
[-depth float]
[-end_location {x y}]
[-expand_spacing_factor float]
[-layer string]
-loc {x y}
[-noFixed]
[-spacing float]
[-spread_type string]
[-start_location {x y}]
[-width float]
[-withOverlap]
```

Changes the pin layer, the pin size, pin status, resolves pin overlap, and moves a selected pin or pin group to a specific location. You can use this command after selecting the pin(s) in the move mode (selecting pins in the design display area with the *Move/Resize/Reshape* tool widget).

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `moveGroupPins` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man moveGroupPins`
`-depth float`	Specifies the depth of the pin or pin group, in micrometers. *Data_type*: float, optional
`-end_location {x y}`	Specifies the coordinates where the pins should end when the pins are spread along a range. *Data_type*: point, optional
`-expand_spacing_factor float`	Specifies the value that will be multiplied to the current spacing in tracks. *Data_type*: float, optional
`-layer string`	Specifies the number of the metal layer for the pin or pin group. *Data_type*: string, optional
`-loc {x y}`	Specifies the new x and y location for the pin or pin group. *Data_type*: point, required
`-noFixed`	Specifies that the moved pins or group of pins are not set to the *fixed* status. *Data_type*: bool, optional
`-spacing float`	Specifies the spacing between pins for multi-pin editing. *Data_type*: float, optional
`-spread_type string`	Specifies how spacing between pins is managed while moving grouped-pins. *Data_type*: string, optional
`-start_location {x y}`	Specifies the coordinates where the pins should start when the pins are spread along a range. *Data_type*: point, optional
`-width float`	Specifies the width of the pin or pin group, in micrometers. *Data_type*: float, optional
`-withOverlap`	Specifies that moved pin(s) can overlap. *Data_type*: bool, optional

Example

The following command moves the selected pin group to a new location (10,20):

```
moveGroupPins -loc 10 20
```

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*
  - Editing Pins

moveMacroInsideModule

```
moveMacroInsideModule
[-help]
{-hInst {hinstName(s)} | -all}
```

Moves all hard macros that belong to the specified module into its boundary. You use this command after the module is placed in the core area.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `moveMacroInsideModule` parameter. For a detailed description of the command and all of its parameters, use the man command: `man moveMacroInsideModule`.
`-all`	Moves all hard macros that belong to hierarchical modules. *Data_type*: bool, optional
`-hInst {hinstName}`	Specifies the name of the hierarchical instance. You can use wildcards (*?) with this parameter. *Data_type*: string, optional

Example

The following command moves all hard macros that belong to modules that have hierarchical instance names that match DTMF_INST/*_TEST_INST into its boundary:

```
moveMacroInsideModule -hInst DTMF_INST/*_TEST_INST
```

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

pasteObject

```
pasteObject
[-help]
[-loc {x y}]
```

Pastes copied placement or routing blockages at the specified location. Use the `copyObject` command to copy the required object. Use this command any time after floorplanning the design. You can also copy and paste selected placement and routing blockages from the GUI by using the Copy tool. To access the Copy tool, choose *Edit - Copy* from the menu bar or press `F3` after clicking the *Copy* widget ( ) on the toolbar.

Parameters

`-help`	Prints a brief description of the `pasteObject` command. For a detailed description of the command, use the `man` command: `man pasteObject`
`-loc {x y}`	Specifies the location for pasting the object copy. *Data_type*: point, optional

Example

- The following commands copy and paste the selected placement and routing blockages:

```
copyObject
pasteObject -loc 10 20
```

Related Information

- `copyObject`
- `editCopy`
- Floorplanning the Design chapter in the *Innovus User Guide*

placeAIO

```
placeAIO
[-help]
[-onlyAIO]
[-assignBump]
[-maxDistance distance]
[-fast]
[-packing]
[-ignoreAIOByName {list}]
[-ignoreAIOByCellName {list}]
[-hardFence]
```

Places I/O driver cells. The area I/O Library must be loaded when importing the design. Area I/O rows are also required.

Note: Once you run the `placeAIO -onlyAIO` command to place the area I/Os, you can run `placePIO -cellList` to specify the cell(s) that must be placed on the periphery.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `placeAIO` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man placeAIO`
`-assignBump`	If you have unassigned bumps for area I/O instance connections, this connects area I/O instances to the nearest unassigned bumps. This option requires that bump cells and bump locations are already loaded. **Note:** You can also assign bumps after area I/O placement by using the `assignBump` command. *Data_type*: bool, optional
`-fast`	Runs area I/O placement in the fast mode, trading speed for quality. *Data_type*: bool, optional
`-hardFence`	If specified, restricts the area I/O placement to the power domain fence to which the area I/O's belong to. *Data_type*: bool, optional
`-ignoreAIOByCellName {list}`	Ignores all area I/O instances that instantiate from the cells specified in the list, during placement. For example, if a cell `PDI` has 2 AIO instances, `test_in_1` and `test_in_2`, this parameter ignores both the instances during placement. *Data_type*: string, optional
`-ignoreAIOByName {list}`	Ignores all the area I/O cells specified in the list, during placement. Specify this parameter if you already placed the area I/O cells on the periphery and you want to avoid placing the same cells in the core. *Data_type*: string, optional
`-maxDistance value`	Specifies the maximum allowable distance between the I/O driver cells and the bumps. *Data_type*: int, optional
`-onlyAIO`	Places only area I/O instances. If this option is not specified, the command will also place all standard cell instances and blocks. *Data_type*: bool, optional
`-packing`	Specifies the packing of I/O driver cells within each cluster of rows. This option is only applicable to designs with clusters of I/O rows. *Data_type*: bool, optional

Examples

- The following command places area I/O instances and all standard cell instances, and assign bumps for all chip I/O pins:
  ```
  placeAIO -assignBump
  ```
- The following command places only area I/O cells:
  ```
  placeAIO -onlyAIO
  ```

Related Information

- placePIO
- Floorplanning the Design chapter in the *Innovus User Guide*

placePadIO

```
placePadIO
[-help]
[-rows numOfRow]
[-maxIOHeight]
```

Places the I/O pads evenly from one row to multiple rows. You can use this command after design initialization when the Innovus software automatically places the I/O pads in one row.

Parameters

`-help`	Outputs a brief description that includes type and default information for each placePadIO parameter. For a detailed description of the command and all of its parameters, use the man command: `man placePadIO.`
`-rows numOfRows`	Specifies the number of I/O rows needed for the placement. *Data_type*: int, optional
`-maxIOHeight`	Specifies the maximum height used to calculate the head box. By default, this command uses the minimum height. *Data_type*: bool, optional

Example

- The following command places I/O pads in two I/O rows:
  ```
  placePadIO -row 2
  ```

Related Information

- `placePIO`
- `placeAIO`
- `setIoRowMargin`
- Floorplanning the Design chapter in the *Innovus User Guide*

placePIO

```
placePIO
[-help]
[-assignBump]
[-optIOs]
[-overflowMap]
[-maxIOHeight]
[-ioFile fileName]
[-rdlConstraintFile fileName]
[-noRandomPlacement]
[-extraConfig fileName]
[-cellList {cellList}]
[-instList {instList}]
[-powerDomain powerDomainList]
```

Places CLASS PAD AREA IO cells on the die boundary (periphery) in random order. Use this command after the design is loaded.

- The command, by default, honors pre-placed or `FIXED` area I/Os in the design and does not modify their placement when executed.
- The command can place IO pads onto the IO rows that belong to a power domain and optimize the locations of the IO pads for the power domain.

  ```
  placePIO -powerDomain {VCCQ_MC0 VCCQ_U VCCQ2_E VCCQ_L VCCQ2_H VCCQ_D VCCQ2_C}
  placePIO -optIOs
  ```

  The I/O row information is retrieved from the power domain itself. IO rows need to be created and added to power domain before the placement and optimization. Run `placePIO -powerDomain {powerDomainList}` for a random placement then use `placePIO -optIOs` for optimized result.

  
  You can use this function to place IO pads in a design that has multiple power domains with IO pads. Innovus recognizes the relationship between the IO pads, IO rows, and power domains and so placement and optimization are automatic.
- The command reads options specified in the `setFlipChipMode` command before placing the CLASS PAD AREA IO cells on the die boundary. It retrieves the `rdlconstraintfile` and `sroute` config file information from the `setFlipChipMode -constraintFile` and `setFlipChipMode -extraConfig` command options.
- During bump assignment, the command uses resistance constraints that are specified in the `rdlconstraintfile` for net(s). To view a constraint file, see "Examples and Report Files" in Flip Chip Methodologies chapter of the *Innovus User Guide*.
- The `placePIO -optIos -assignBump` command also reads `setFlipChipMode -routeWidth` value before reassigning the signal bumps in the design.
- When the I/O row flow is enabled (`setIoFlowFlag 1`), the `placePIO` command restricts I/O placement in the rows created previously, instead of all possible locations. However, you need to ensure that the I/O rows are created outside the I/O box.

  Command flow:

  ```
  setIoFlowFlag 1
  createIoRow
  placePIO
  ```

Note: IO cells must be defined as CLASS PAD on the boundary of the design. The peripheral I/O Library must be loaded when importing the design. Peripheral I/O rows are also required.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `placePIO` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man placePIO`.
`-assignBump`	Allows signal bumps to be reassigned to improve routing if the I/O cells have been fixed. *Data_type*: bool, optional
`-cellList {instlist}`	Specifies which area I/O cell(s) must be placed on the periphery. Once you run `placePIO -cellList` to grab the area I/O cells for placement on the periphery, you can run `placeAIO -ignoreAIOByName {list}` to avoid the placement of these cells in the core area. *Data_type*: string, optional
`-extraConfig fileName`	Specifies a file containing user-defined placement options written in `sroute` syntax. For more information, see "Extra Configuration File Options for fcroute" in `fcroute`. *Data_type*: string, optional
`-ioFile fileName`	Specifies the name of a file to control the placement of the I/O cells. It supports the version 3.0 I/O file format. *Data_type*: string, optional
`-instList {instList}`	Specifies which area I/O instance(s) must be grabbed for placement on the periphery. Once you run `placePIO -instList` to place the area I/O instances on the periphery, you can run `placeAIO -ignoreAIOByName {list}` to avoid the placement of these instances in the core area. *Data_type*: string, optional
`-maxIOHeight`	Specifies the maximum height for the I/O row. *Data_type*: bool, optional
`-noRandomPlacement`	Without options, the `placePIO` command randomly places all I/O cells on the periphery. This option inhibits this behavior and optimizes pads without initial placement. *Data_type*: bool, optional
`-optIOs`	Allows I/O cells to be moved to improve routing if the bumps have been fixed, optimizing the initial placement. *Data_type*: bool, optional

`-overflowMap`	Displays the congestion map using the width and spacing parameters specified in the extra configuration file. To display the congestion map, run the following command to specify the options for the extra configuration file:
	`placePIO -noRandomPlacement -overflowMap -extraConfig scripts/global.cfg`
	where:
	`scripts/global.cfg`:
	`srouteBottomLayerLimit 8 /* Assume the intended routing layer range is M8 to M9 */`
	`srouteTopLayerLimit 9`
	`srouteRouteWidth 10000 /* n is the routing width, in db unit - 5u */`
	Data_type: bool, optional

`-powerDomain powerDomainName`	Specifies the name of the power domain that consists of peripheral I/Os. The I/O row information can now be retrieved from the power domain itself. *Data_type*: string, optional
`-rdlConstraintFile fileName`	Specifies a file with constraints to control the placement of the I/O cells. The command uses resistance constraints specified in this file, for cell placement. To view a constraint file, see "Examples and Report Files" in Flip Chip Methodologies chapter of the *Innovus User Guide*. *Data_type*: string, optional

Example

- The following command places CLASS PAD AREA IO cells on the die boundary (periphery) and allows I/O cells to be moved to improve routing if the bumps have been fixed, optimizing the initial placement:
  `placePIO -optIOs`

predict_floorplan

```
  predict_floorplan
[-help]
[-allow_illegal_macro]
[-enable_cpg]
[-reshape [[-post_reshape_tcl string]]]
[{-reshape | -skip_generate_fence }]
```

Generates an initial floorplan that can be used as a starting point for making the final floorplan. It can generates fences on power domains automatically, and then does the placement for all instances. If the design has macros/blocks, the `predict_floorplan` command calls the mixed placer to place the macros/stdcells, however, the design has only stdcells, then the `place_opt_design` command is called.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `predict_floorplan` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man predict_floorplan`
`-allow_illegal_macro`	Allows the tool to continue even when macros are not legally placed. *Default*: false *Data_type*: bool, optional
`-enable_cpg`	Enables CPG for a design which already has a floorplan with macro locations. *Data_type*: bool, optional
`-post_reshape_tcl` *string*	When specified it allows the tool to load user specified floorplan objects (like tracks) after the floorplan has been reshaped. **Note**: This option must be use with the -reshape parameter. *Data_type*: string, optional
`-reshape`	Enables the floorplan to be enlarged in order to fit all instances. *Data_type*: bool, optional
`-skip_generate_fence`	When specified, auto-fence generation is skipped. *Data_type*: bool, optional

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

queryFPlanObject

```
queryFPlanObject
[-help]
[-pd]
```

Prints the properties of selected objects to the console. This command supports only instances and modules. You can use this command after selecting one ore more instances or modules.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `queryFPlanObject` parameter. For a detailed description of the command and all of its parameters, use the man command: `man queryFPlanObject`
`-pd`	Use this option to output power domain information, as well as check if the objects belong to a power domain. *Data_type*: bool, optional

Example

The following commands select and print property information for module `modA`:

```
selectInst modA
queryFPlanObject -pd
```

Related Information

- `selectInst`
- Floorplanning the Design chapter in the *Innovus User Guide*

refine_macro_place

```
refine_macro_place
[-help]
[-verbose ]
```

Legalizes the macros based on constraints such as halo and blockages, forbidden spacing, min-space, etc. To define the constraints of macros, use the `set_macro_place_constraint` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `refine_macro_place` parameter. For a detailed description of the command and all of its parameters, use the man command: `man refine_macro_place`
`-verbose`	Writes the macro movement details to a tcl file. *Data_type*: bool, optional

Example

The following command specifies the minimum space between macro-to-core boundary as 5 and the forbidden space between macro-to-core boundary as 2.

```
set_macro_place_constraint -forbidden_space_to_core 2 -min_space_to_core 5
refine_macro_place
```

Related Information

- `set_macro_place_constraint`
- `setPlaceMode`

refineMacro

```
refineMacro
[-help]
{{-area {x1 y1 x2 y2} [-selected]}| -permutePack | -markStep | -restoreStep step_number
       |-restoreMark mark_number}
[-adjustPack]
[-ioPinClearance]]
```

Refines the placement of macros in the floorplan. By default, the `refineMacro` command performs global incremental macro adjustment. You can also adjust specific macro packs, or all of the macros in a specific area of the design. You can use `refineMacro` command after creating an initial floorplan and analyzing the results. Macros must have a status of PLACED in the database in order to use this command.

Parameters

`-adjustPack`	Adjusts the way that macros packs are placed, relative to their locations. For example, an array of 16 macros might be placed in four rows of four macros (4 x 4), if they are near the top or bottom of the chip. This might change to eight rows of two macros (8 x 2), if the macros are moved near the left or right edge of the chip. *Data_type*: bool, optional
`-area` *x1 y1 x2 y2*	Adjusts the placement of any macros within the specified area to reduce empty area between them. If you also specify `-selected`, the selected macros are moved to the specified area and their position is adjusted along with any macros already within the area. *Type:* Float, specified in microns
`-help`	Outputs a brief description that includes type and default information for each `refineMacro` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man refineMacro`.
`-ioPinClearance`	Leaves an internally calculated amount of clearance space between placed macros and block I/O pins. Use this parameter to ensure that pins are accessible to the router. *Data_type*: bool, optional
`-markStep`	Marks an intermediate macro refinement step to save. When you perform incremental macro refinement, each adjustment is considered a step. By default, all incremental steps done with the `refineMacro` command are saved and listed in the log file with a number. Since the manal refinement steps (such as move, rotate, and flip) are not saved by default, you can use this parameter to mark manual refinement steps, or any other important step that you want to save. **Note:** Innovus saves up to 1000 incremental refinement steps in the database and 20 marks before overwriting them. *Data_type*: bool, optional
`-permutePack`	Adjusts the placement of a selected pack of macros to reduce empty area between them. A pack is a set of macros from the same seed that have similar sizes and aspect ratios and have been grouped together. You must select the macro pack in the main window before using this parameter. You can select one macro to select the entire pack. Macro pack information is stored temporarily in the database. If you quit the Innovus session, the information is lost. *Data_type*: bool, optional
`-restoreMark` *mark_number*	Returns the design to the state it was in after the specified marked step (`-markStep`). For example, to return the design to the state it was in after the step saved as `mark2`, specify: `refineMacro -restoreMark 2` You can find the mark numbers listed in the log file. *Data_type*: int, optional

`-restoreStep` *step_number*	Returns the design to the state it was in after the specified intermediate non-marked step.
	For example, to return the design to the state it was in after step 4, specify:
	`refineMacro -restoreStep 4`
	To return the design to the state it was in after the previous adjustment, specify:
	`refineMacro -restoreStep -1`
	You can find the step numbers listed in the log file.
	Data_type: int, optional

`-selected`	Moves the selected macros to the specified area and adjusts their position along with any macros already within the area. **Note:** You cannot use this parameter without specifying the `-area` parameter. *Data_type*: bool, optional

Example

The following command moves the selected macros to a new area:

```
refineMacro -selected -area 100 100 200 300
```

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

report_narrow_channel

```
report_narrow_channel
[-help]
{-width width}
[-ignore_placement_blockage ]
[-no_merge_channel_check ]
[-direction {x y xy}]
[-active_objects {macro macroHalo ioPad ioCell core fence hardBlkg softBlkg partialBlkg routeBlkg row}] }
```

Creates a report that contains a list of narrow channels.

Note: The `report_narrow_channel` command returns channel boxes as its return value.

Parameters

`-active_objects {macro macroHalo ioPad ioCell core fence hardBlkg softBlkg partialBlkg routeBlkg row}`	
	Specifies the active objects for narrow channel checking. *Default*: `"core macro macroHalo hardBlkg"` *Data_type*: enum_list, optional
`-help`	Outputs a brief description that includes the type and default information for each `report_narrow_channel` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man report_narrow_channel`

`-direction {x y xy}`	Specifies the direction for checking narrow channels. You can specify x, y, or xy.
	Default: xy
	Example:
	`report_narrow_channel -width 100 -direction x`
	 	
	`report_narrow_channel -width 100 -direction y`
	 	
	`report_narrow_channel -width 100 -direction xy`
	 	
	Data_type: enum, optional

`-ignore_placement_blockage`	When specified, the placement blockages are ignored while computing channel widths. *Data_type*: bool, optional

`-no_merge_channel_check`	Specifies that the narrow channel error boxes will be merged into contiguous error boxes. Example: `report_narrow_channel -width 100 -direction xy -no_merge_channel_check`  *Data_type*: bool, optional
`-width` *width*	Specifies the width for checking the channels. *Maximum*: `100000` *Minimum*: `0` *Data_type*: float, optional

Example

The following command checks for channels with width 1.0 and ignores placement blockages:

```
report_narrow_channel -width 1.0 -ignore_placement_blockage
```

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

report_obj_connectivity

```
report_obj_connectivity
[-help]
[-direction {in|out|all}]
[-file file_name]
[-level level]
[-no_split]
[-through_registers]
[-to_ports]
[-insts inst+] | [-ports port+] | [-selected]
```

Reports the connections of specified macros, selected macros, or specified ports. You can also report the input and output connectivity separately. By default it reports both.

Parameters

`-direction {in|out|all}`	Specifies the pin direction of objects to be reported. *Default*: `all` *Data_type*: string, optional
`-file file_name`	Specifies the name of the output report file in which the trace macro results will be saved. *Default*: `<top_module_name>.tmcrpt` *Data_type*: string, optional
`-help`	Outputs a brief description that includes type and default information for each `report_obj_connectivity` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_obj_connectivity`
`-insts inst+`	Specifies the macros to be reported. *Data_type*: string, optional
`-level level`	Specifies the trace level. *Maximum*: 10 *Minimum*: 1 *Default*: 5 *Data_type*: int, optional
`-no_split`	Reports a single object per line.
`-ports port+`	Specifies the IO ports to be reported. *Data_type*: string, optional
`-through_registers`	Reports the through registers between selected objects. *Data_type*: bool, optional
`-to_ports`	Reports the connectivity from the selected objects to IO ports. *Data_type*: bool, optional
`-selected`	Reports the selected macros or IO ports. *Data_type*: bool, optional

Example

The following command reports the selected macros or IO ports:

```
report_obj_connectivity -selected
```

reportNetGroup

```
reportNetGroup
[-help]
[-outfile fileName]
```

Creates a report that contains net groups and their nets. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `reportNetGroup` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man reportNetGroup`
`-outfile fileName`	Specifies the report filename. If no filename is specified, the report is printed to the console window. *Data_type*: string, optional

Example

Check the bump assignment and send the report to `netGrp.rpt`:

```
reportNetGroup -outfile netGrp.rpt
```

The output format is the same as the NetGroup section of the floorplan file:

```
# NetGroup Report File
NetGroup: netGroupName_one
    GroupNet net_name_01_in_netGroupName_one
    GroupNet net_name_02_in_netGroupName_one
NetGroup: netGroupName_two
    GroupNet net_name_01_in_netGroupName_two
    GroupNet net_name_02_in_netGroupName_two
```

reportSeedConnection

```
reportSeedConnection
[-help]
[-constraints filename]
[-excNetFile filename]
[-file outfile]
```

Reports the number of connections between user-specified seeds.

Parameters

`-constraints` *filename*	Specifies the name of the input constraints file containing the seed definition. *Data_type*: string, optional

`-excNetFile` *filename*	Specifies the name of the exclude net file to use during the calculation of seed connections. The excNetFile format should be:
	`#any comment`
	`netName, netName,...`
	`netName, netName,...`
	Data_type: string, optional

`-file` *filename*	Specifies the name of the output report file in which the information about the number of connections between user-specified seeds is written. *Data_type*: string, optional
`-help`	Outputs a brief description that includes type and default information for each `reportSeedConnection` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reportSeedConnection`.

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

reportSelect

```
reportSelect
[-help]
-file filename
```

Reports the properties of one or more selected objects in the design display area in the main console window and the Innovus log file. You can use this command after selecting one or more objects in the design display area.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `reportSelect` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man reportSelect`
`-file filename`	Specifies the name of the output file that reports the properties of the selected object. *Data_type*: string, optional

Example

The following command generates a report file `object.rpt`, which displays the properties of the selected object:

```
reportSelect -file object.rpt
```

The following is the output format of the report file:

```
Object Type : IO Cell
Name : IOPADS_INST/Ptdspip00
No. of Terminals : 2
Cell Type : PDIDGZ
Cell Width : 40.0
Cell Height : 235.0
Location : 253.78 0.0
Location Origin : Lower Left
Orientation : R0
Status : PLACED
Routing Halo : None
InstGroup : None
```

Related Information

reportUnsnapBlocks

```
reportUnsnapBlocks
[-help]
```

Reports unsnapped blocks based on the snap preferences (as defined in the *Floorplan Tab* of the *Preferences* form). You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description of the `reportUnsnapBlocks` command. For a detailed description of the command, use the man command: `man reportUnsnapBlocks`

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*
- Floorplan Menu chapter in the *Innovus Menu Reference*

reset_macro_place_constraint

```
reset_macro_place_constraint
[-help]
[-array]
[-avoid_abut_macro_edge_with_pins]
[-cell_obs]
[-cpg]
[-forbidden_space_to_core]
[-forbidden_space_to_macro]
[-honor_strict_spacing_constraint]
[-horizontal_stacking]
[-instance_orientation]
[-macro_corner_keepout]
[-max_io_pin_group_keep_out]
[-min_space_to_core]
[-min_space_to_macro]
[-parallel_run_length]
[-pg_resource_model]
[-same_length_site]
[-track_adjustment]
[-vertical_stacking]
```

Resets the macro constraints that are honored by the macro placer. To define the constraints of macros, use the `set_macro_place_constraint` command.

Parameters

`-array`	Deletes all the array constraints. *Data_type*: bool, optional
`-avoid_abut_macro_edge_with_pins`	
	Specifies that macro edges with pins should not be abutted even when the macro distance is within the forbidden spacing setting. *Data_type*: bool, optional
`-cell_obs`	Deletes all the cell obstruction constraints. *Data_type*: bool, optional
`-cpg`	Deletes all the cpg constraints. *Data_type*: bool, optional
`-forbidden_space_to_core`	Resets the forbidden space to core. *Data_type*: bool, optional
`-forbidden_space_to_macro`	Resets the forbidden space to macro. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `reset_macro_place_constraint` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reset_macro_place_constraint`
`-honor_strict_spacing_constraint`	Specifies that forbidden spacing and minimum spacing constraints should be honored strictly. *Data_type*: bool, optional
`-horizontal_stacking`	Resets the maximum horizontal stack depth and the minimum horizontal spacing. *Data_type*: bool, optional
`-instance_orientation`	Deletes all the instance orientations. *Data_type*: bool, optional

`-macro_corner_keepout`	Resets the macro corner keepout constraints. *Data_type*: bool, optional
`-max_io_pin_group_keep_out`	Deletes the macro-only blockages which are automatically added to IO pins and resets the maximum height or width of macro-only blockages to 0. *Data_type*: bool, optional
`-min_space_to_core`	Resets the minimum space to core. *Data_type*: bool, optional
`-min_space_to_macro`	Resets the minimum space to macro. *Data_type*: bool, optional
`-parallel_run_length`	Resets the parallel run length to enable space checking. *Data_type*: bool, optional
`-pg_resource_model`	Deletes the pg resource model constraints. *Data_type*: bool, optional
`-same_length_site`	Resets the minimum difference site number. *Data_type*: bool, optional
`-track_adjustment`	Deletes all the track adjustment. *Data_type*: bool, optional
`-vertical_stacking`	Resets the maximum vertical stack depth and the minimum vertical spacing. *Data_type*: bool, optional

Example

The following command deletes all the pg resource model constraints:

```
reset_macro_place_constraint -pg_resource_model
```

Related Information

resizeFloorplan

```
resizeFloorplan
[-help]
[-xSize xAxisSize]
[-ySize yAxisSize]
[-xPercent xAxisPercent]
[-yPercent yAxisPercent]
[-undo]
[-pushCore]
[-forceResize]
```

Resizes the floorplan while maintaining the relative locations of the existing floorplan. You can also set global parameters for the `resizeFloorplan` by using the `setResizeFPlanMode` command. Parameters that you specify with `setResizeFPlanMode` are then used automatically whenever you run the `resizeFloorplan` command or use the *Resize Floorplan* form. You can use this command after importing the design. When run on a block design, the `resizeFloorplan` command keeps physical PG pins during resize and trims the PG pin geometries that fall out of the chip boundary after resize.

Note: You can use the `addSizeBlockage` command to add a size blockage object that controls the behavior of the resize line under a covered area.

Parameters

`-forceResize`	Resizes the floorplan even if the target size can not be met. However, the floorplan is resized as near as possible to the specified size. *Default*: If you do not specify this parameter, the floorplan is not resized if the target size can not be met. **Note**: This parameter can be used only when the `setResizeFplanMode -shiftBased` parameter has been set to `true`. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `resizeFloorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man resizeFloorplan`
`-pushCore`	Pushes the core when the design is I/O bound. *Data_type*: bool, optional
`-undo`	Revert to the floorplan that existed before the command was run. *Data_type*: bool, optional
`-xPercent xAxisPercent`	Specifies the percentage of how much the floorplan should be expanded or shrunk in the x direction. A positive value expands the floorplan and a negative value shrinks the floorplan. *Data_type*: float, optional
`-yPercent yAxisPercent`	Specifies the percentage of how much the floorplan should be expanded or shrunk in the y direction. A positive value expands the floorplan and a negative value shrinks the floorplan. *Data_type*: float, optional
`-xSize xAxisSize`	Specifies how much the floorplan should be expanded or shrunk in the x direction. A positive value expands the floorplan and a negative value shrinks the floorplan. This value is in microns. **Note**: If both `-xSize` and `-ySize` parameters are specified, the resize order is the same as the order of the parameters. *Data_type*: float, optional
`-ySize yAxisSize`	Specifies how much the floorplan should be expanded or shrunk in the y direction. A positive value expands the floorplan and a negative value shrinks the floorplan. This value is in microns. *Data_type*: float, optional

Example

The following command resizes the floorplan as follows: shrinks the floorplan in shift based mode by -50 microns in the x direction and -40 microns in the y direction.

```
resizeFloorplan -xSize -50 -ySize -40
```

Related Information

  - Resizing the Floorplan

save_global

```
save_global
[-help]
file_name
```

Saves the current global variable settings in a file. You can use this command after setting the global variable.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `save_global` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man save_global`
`file_name`	Specifies the file in which the global variable setting should be saved. *Data_type*: string, required

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

saveFPlan

```
saveFPlan
file
[-help]
[-noName]
[-objType {macro | pin | bndry | special_route | pin_constraint}]
[-xml]
```

Saves the floorplan information to a file. The command saves all the floorplan blocks that are placed/fixed/covered, in the floorplan file. When you save a floorplan, the Innovus software saves all objects which can be saved and any specific properties which are affected if the data is saved. By default, the floorplan information is saved as a Version 8 floorplan file. After you save a floorplan, the Innovus software creates the following files:

- A general floorplanning file with the extension .fp
- A power route data file with the extension .fp.spr
  Note: If there is an entry in the IO Cell Libraries field in the Design Import form, a third file is created with the extension `.fp.areaio`.

Note:

- The `saveFPlan` command honors the blackbox min/max aspect ratio information in the floorplan information file.
- The `saveFPlan` command saves the net attributes including non-default attributes of a net, like weight, bottomPreferredRoutingLayer, or detour. You can use this command after importing the design.
- The `saveFPlan` command saves the user-specified seed information by default.
- The `saveFPlan` command saves the information related to blockages, tracks, and pin shapes into the *.fp file.
- The `saveFPlan` command saves feedthrou-bumps into the .fp.areaio file. The format is as below:
  Bump: [BumpName] [BumpCellName] [x coord] [y coord] [BumpPin_1] [PinName_1] [BumpPin_2] [PinName_2]

Parameters

file	Specifies the name of floorplan file to be saved. *Data_type*: string, required
`-help`	Outputs a brief description that includes type and default information for each `saveFPlan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man saveFPlan`.
`-noName`	Specifies that floorplan object names are not output to the floorplan file when you save the floorplan. *Data_type*: bool, optional
`-objType {macro | pin | bndry | special_route | pin_constraint}`	
	Specifies the objects section in the floorplan file that will be updated. The sections can be: • `macro` • `pin` • `bndry` • `special_route` • `pin_constraint` **Note:** The `saveFPlan` command supports routing blockages on master slice layers. *Data_type*: string, optional
`-xml`	Saves the floorplan information in the XML format floorplan file. *Data_type*: bool, optional

Example

The following command writes the current floorplan information to the file `myFloorPlan.fp`:

```
saveFPlan myFloorPlan.fp
```

Related Information

- `loadFPlan`
- `loadPtnPin`
- Floorplanning the Design chapter in the *Innovus User Guide*

saveIoFile

```
saveIoFile
[-help]
[-v2]
[-locations | -byOrder]
[-includeCellName]
[-only_selected_bump]
[-temp [-ioOrder {default | clockwise | counterclockwise}]]
[-relativeOrient]
fileName
```

Saves the current I/O information to a Version:3 file by default. It also provides you the option to save the I/O information in a Version:2 file for 6.2 and earlier releases of the software. The saved file can be used to specify the I/O Assignment File in the Design Import form. This is used to save the I/O pin or pad order to a file after assigning pins or pads by loading a floorplan file or DEF data. This I/O Assignment file is rule-based, and the keyword in the I/O file is Version:3. You can use this command after floorplanning the design.

Note: The `saveIoFile` command saves the bump connect target information in the I/O file by default.

Note: The `saveIoFile` command will write all the information of I/O pins and I/O pads if the design has both IO pins and IO pads.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `saveIoFile` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man saveIoFile`
`-byOrder`	Specifies the order of the I/O pad placement locations in the I/O file. *Data_type*: bool, optional
`-includeCellName`	Specifies that the cell name of the I/O instance must be included in the I/O file. *Data_type*: bool, optional
`-ioOrder {default | clockwise | counterclockwise}`	
	Specifies the order of placing the I/O pins in the I/O template file. You can choose one of the following: • `default`: Specifies the default pin order. For a vertical edge, the default pin order is from the bottom to the top. For a horizontal edge, the default pin order is from the left of the right. • `clockwise`: Specifies the pin order in the clockwise direction. • `counterclockwise`: Specifies the pin order in the clockwise direction. **Note:** For I/O cells, the saveIoFile command will write out only the default I/O order. *Data_type*: string, optional
`fileName`	Specifies the name of the pin order file to be written to. *Data_type*: string, required
`-locations`	Generates an I/O file that has placement locations rather than a sequence or order of the I/O pads. Placement co-ordinates are relative to the design boundary and are not absolute locations. *Default:* If you do not specify this parameter, it generates an order file. *Data_type*: bool, optional
`-only_selected_bump`	Saves only the selected bumps to the IO file. By default, `saveIoFile` dumps out embedded bumps to the IO file. When the `-only_selected_bump` option is specified, only selected bumps are dumped out and embedded bumps are ignored. *Data_type*: bool, optional
`-relativeOrient`	Specifies an I/O orientation relative to the bottom (south) side. *Data_type*: bool, optional
`-temp`	Performs initial I/O placement by randomly distributing the I/Os evenly. Writes out an I/O template file with evenly spaced I/O pins, after design import. Once the I/O template file is generated, you can modify the I/O file manually and reload the file in Innovus. *Data_type*: bool, optional
`-v2`	Saves the current I/O information to a Version: 2 file for 6.2 and earlier releases of the software. If you specify this parameter for saving an I/O file consisting of rectilinear design for I/O pads, Innovus displays an error message. This is because the rectilinear design for I/O pads is supported only in the current release version of Innovus. *Default*: If you do not specify this parameter, the I/O information is saved in a Version: 3 file. *Data_type*: bool, optional

Example

- The following command writes the current I/O pad and pin information to Version: 3 file:
  ```
  saveIoFile myIoPlan.io
  ```
- The following command writes the current I/O pad and pin information to a Version: 2 file and specifies the clockwise placement of the I/O pins in the I/O template file:
  ```
  saveIoFile -v2 -ioOrder clockwise -template myIoPlan.io
  ```

select_row

```
select_row
[-help]
[-all | -name string | -site string]
```

Selects the specified row(s), enabling you to issue an additional command for the row. Use this command after importing a design.

Parameters

`-all`	Specifies that all rows will be selected. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `select_row` parameter. For a detailed description of the command and all of its parameters, use the man command: `man select_row`
`-name string`	Specifies the name or id of the row(s) to be selected. *Data_type*: string, optional
`-site string`	Specifies the site for which rows will be selected. *Data_type*: string, optional

Example

The following command selects rows from the site site0A10.

```
select_row -site site0A10
```

Related Information

- `deleteRow`
- `cutRow`
- Floorplanning the Design chapter in the *Innovus User Guide*
  - Creating and Editing Rows

selectGroup

```
selectGroup
[-help]
groupName
```

Selects a group. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `selectGroup` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man selectGroup`
`groupName`	Specifies the name of the group. *Data_type*: string, required

Related Information

- `deselectGroup`
- Floorplanning the Design chapter in the *Innovus User Guide*

selectInst

```
selectInst
[-help]
instName | {list_of_instNames}
```

Selects an instance and highlights it in the design display window. You can use this command after importing or restoring the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `selectInst` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man selectInst`
instName	Specifies the name of one or more than one insts. You can use wildcards (*) to specify inst names. *Data_type*: (inst)+, required

Example:

- The following command selects nets and highlights them in the design display window:
  ```
  selectInst {reg1 reg2}
  ```

Related Information

- `queryFPlanObject`
- `deselectInst`
- Floorplanning the Design chapter in the *Innovus User Guide*

selectInstByCellName

```
selectInstByCellName
[-help]
cellName
```

Selects instances and hierarchical instances by cell name. When hierarchical instances are selected, child instances are also highlighted. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `selectInstByCellName` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man selectInstByCellName`
`cellName`	Specifies the name of the cell. *Data_type*: (libCell/ptnCell|vCell|topCell)+, required

Related Information

- `deselectInstByCellName`
- Floorplanning the Design chapter in the *Innovus User Guide*

selectInstOnNet

```
selectInstOnNet
[-help]
netName
```

Selects an instance on a net. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `selectInstOnNet` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man selectInstOnNet`
`netName`	Specifies the name of the net. *Data_type*: (net)*, required

Related Information

- `deselectInstOnNet`
- Floorplanning the Design chapter in the *Innovus User Guide*

selectIOPin

```
selectIOPin
[-help]
pinName
```

Selects an I/O pin. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `selectIOPin` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man selectIOPin`
`pinName`	Specifies the name of the I/O pin. *Data_type*: string, required

Related Information

- `deselectIOPin`
- Floorplanning the Design chapter in the *Innovus User Guide*.

selectNet

```
selectNet
[-help]
{netName | {list_of_netNames} | -allDefClock | -clock | -nonDefaultRule | -shield}
```

Selects a net and highlights it in the design display window. You can use this command after importing or restoring the design.

Parameters

`-allDefClock`	
	Selects all nets that have a DEF attribute `+ USE CLOCK` **Note:** The `-allDefClock` parameter is for backward compatibility only. Cadence recommends that you use the `-clock` parameter to select all nets that have a DEF attribute `+ USE CLOCK` *Data_type*: bool, optional
`-clock`	Selects all clock nets. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `selectNet` parameter. For a detailed description of the command and all of its parameters, use the man command: `man selectNet`
netName | {*list_of_netNames*}	
	Specifies the name of one or more than one nets. You can use wildcards (*) to specify net names. *Data_type*: (net)*, optional
`-nonDefaultRule`	
	Selects all nets that have a DEF attribute `+ USE NONDEFAULTRULE` *Data_type*: bool, optional
`-shield`	Selects all nets that have a DEF attribute `+ USE SHIELDNETS` *Data_type*: bool, optional

Example:

- The following command selects nets and highlights them in the design display window:
  ```
  selectNet {net1 net2 net3}
  ```

Related Information

- `deselectNet`
- Floorplanning the Design chapter in the *Innovus User Guide*

selectPGPin

```
selectPGPin
[-help]
[-area llx lly urx ury]
[-net netName]
[-layer layerId | {layerIdList}]
[-all]
```

Selects power/ground pins as per the specified parameters and reports the number of selected power/ground pins. You can use this command after importing the design.

Parameters

`-all`	Selects all the power/ground pins. *Data_type*: bool, optional
`-area llx lly urx ury`	
	Specifies a bounding box for the area in which power/ground pins are to be selected. *Data_type*: box, optional
`-help`	Outputs a brief description that includes the type and default information for each `selectPGPin` parameter. For a detailed description of the command and all of its parameters, use the man command: `man selectPGPin.`
`-layer layerId | {layerIdList}`	
	Specifies the layer(s) on which the power/ground pins are to be selected. **Note:** Layers can be specified using the LEF layer names or layer ID numbers. *Data_type*: string, optional
`-net netName`	Specifies the name of the net whose attached power/ground pins are to be selected. *Data_type*: (net)+, optional

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*.

selectRouteBlk

```
selectRouteBlk
[-help]
[-box llx lly urx ury]
name
[-layer layerId | layerIdlist ...]
```

Selects the routing blockages based on the following specifications:

- The coordinates of the bounding box
- The name of the blockage
- The layer(s) or the via(s). The command supports selection on multiple layers and/or vias.

If you don't specify the box coordinates, [*llx lly urx ury*], the command selects the first routing blockage by name and layer.

Use this command during partition floorplanning.

Parameters

`-box llx lly urx ury`	
	Specifies the coordinates of the blockage area. • *llx*: Specifies the lower left x coordinate of the blockage box. • *lly*: Specifies the lower left y coordinate of the blockage box. • *urx*: Specifies the lower right x coordinate of the blockage box. • *ury*: Specifies the lower right y coordinate of the blockage box. *Data_type*: box, optional
`-help`	Outputs a brief description that includes the type and default information for each `selectRouteBlk` parameter. For a detailed description of the command and all of its parameters, use the man command: `man selectRouteBlk.`
`-layer layerId | layerIdlist ...`	
	Specifies the layer(s) and/or via(s). For layer names, specify the number. For example 3. For via names specify the lowercase character v followed by the via number. For example, v3. **Note:** The `-layer` parameter supports masterslice layers with type `REGION`. *Data_type*: string, optional
name	Specifies the name of the routing blockage. All the routing blockages with the specified name get selected. You can use wildcards (* or ?) for specifying the names of routing blockages. *Data_type*: string, required

Examples

- The following command selects all the routing blockages with the name blk.
  ```
  selectRouteBlk blk
  ```
- The following command selects the routing blockages with names blk1, blk2, and so on.
  ```
  selectRouteBlk blk*
  ```
- The following command selects the routing blockage blk1 that lies in the bounding box with the coordinates 17, 223, 1117, and 1223. The commands selects the routing blockage on layer 1 and layer 2.
  ```
  selectRouteBlk -box 17 223 1117 1223 blk1 -layer 1 2
  ```
- The following command selects the routing blockage blk1 on layer 3 and 4.
  ```
  selectRouteBlk blk1 -layer 3 4
  ```
- The following command selects the routing blockage blk2 that lies in the bounding box with the coordinates 17, 223, 1117, and 1223. The commands selects the routing blockage on layer1 and via 2.

```
selectRouteBlk -box 17 223 1117 1223 blk2 -layer 1 v2
```

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

set_macro_place_constraint

```
set_macro_place_constraint
[-help]
[array elements]
[-array array_name [-common_hier name][-valid_group_orients {R0 MX MY}]
  [-place_order {horizontal vertical}]]
[{-insts string | -all_macros } {-orientation string} [-common_hier name]]
[-cells string {-cell_obs string | -track_adjustment string}]
[-cpg string]
[[-max_io_pin_group_keep_out {depth_value [side_value]}]
[-forbidden_space_to_core {unified_value | horizontal_value vertical_value}]
[-forbidden_space_to_macro {unified_value | horizontal_value vertical_value}]
[-min_space_to_core {unified_value | horizontal_value vertical_value}]
[-min_space_to_macro {unified_value | horizontal_value vertical_value}]
[-parallel_run_length float]
[-horizontal_stacking {max_macro_stack_length min_space_between_macro_stack max_space_between_macros}]
[-vertical_stacking {max_macro_stack_length min_space_between_macro_stack max_space_between_macros}]
[-honor_strict_spacing_constraint {true | false}]
[-avoid_abut_macro_edge_with_pins {true | false}]
[-same_length_site integer]
[-pg_resource_model {M1 value1 M2 value2 …}]
[-macro_corner_keepout {double_endcap_width double_endcap_height}]
[-halo_sharing {true | false}]]
```

Enables you to specify the constraints for placing the macros and standard cells concurrently. These constraints can be used to place macros in an array (or matrix) and define the relative placement of each macro. The whole array, treated like one macro, can be flipped or mirrored (R0, MX, MY, R180). You can use the new `set_macro_place_constraint` command to specify:

- Macro array constraints
- Group aligning constraints
- Macro-to-macro and macro-to-core boundary spacing constraints
- Macro orientation constraints
- Over macro power routing modeling
- Maximum stacking length
- Reserved space for pin routing
- I/O Pin Keep-out

Note: For more information on the mixed placement constraints, see the "Mixed Place Constraints" section of the Using the Mixed Placer chapter in the *Innovus User Guide*.

Parameters

`-all_macros`	Specifies that all macros should honor the constraints. This option makes sense when using the `-orientation` option. *Data_type*: bool, optional
array_elements	Specifies the instance members information of a row or column of the array in the following format: *inst_name*:*orientation* [*spacing inst_name*:*orientation*] + **Note:** The *array_elements* should be specified with the `-array` parameter. *Data_type*: string, optional
`-array` *array_name*	Specifies the macro array name. *Data_type*: string, optional

`-avoid_abut_macro_edge_with_pins {true | false}`	When set to true, the `set_macro_place_constraint` command does not abut macro edges with pins even if the macro distance is within the forbidden space setting. Macros will be separated by the `min_space_to_macro` distance. *Default*: `true` *Data_type*: enum, optional
`-cell_obs {{Layer1_Name PowerStripeWidth SpacingBetweenStripes} {Layer2_Name ….}}`	

	Specifies the layer width and spacing to add cell obstruction on each macro to model power stripes . During the concurrent macro placement the power mesh does not exist. This parameter allows to mimic the number of routing tracks occupied by the real power mesh over the macros to make the congestion analysis more accurate during the concurrent macro placement.
	The format is:
	`cell_obs{{Layer1_Name PowerStripeWidth SpacingBetweenStripes} {Layer2_Name ….}}`
	Example:
	`set_macro_place_constraint -cells <cell_name>  -cell_obs {{M5 0.24 1.251} {M8 0.64 8.409} {M9 1.2 7.49} }`
	Note: This setting is generated automatically by the `create_pg_model_for_macro_place` command. It is highly recommended to use this command to define the `-cell_obs` parameter.
	Data_type: string, optional

`-cells string`	Used in combination with the -cell_obs command to specifies the constraints for all instances of the specified cells. *Data_type*: string, optional
`-common_hier name`	Specifies the common logic hierarchy name for `inst_name` in `array_elements`, so the `inst_name` can be specified with short-hand format. *Data_type*: string, optional
`-cpg string`	Specifies the cpg guide of one instance. *Data_type*: string, optional
`-forbidden_space_to_core {unified_value | horizontal_value vertical_value}`	
	Specifies the value for forbidden spacing between macro to core boundary. If the space between the macro and core is smaller than this value, then the macros are abutted. **Note:** • If only one unified value is specified, both horizontal and vertical spacings use the same value. If two values are specified, the first value is for the horizontal spacing, the second value is for the vertical spacing. • In case the `-min_space_to_core` parameter has been specified, then the value specified for the `-forbidden_space_to_core` parameter should be less than the value specified for the `-min_space_to_core` parameter. *Minimum=0* *Maximum=100000* *Default:* `0` *Data_type*: string, optional
`-forbidden_space_to_macro {unified_value | horizontal_value vertical_value}`	

	Specifies the value for forbidden spacing between macro to macro boundary. If the space between the macros is smaller than this value, then the macros are abutted. **Note:** • If only one unified value is specified, both horizontal and vertical spacings use the same value. If two values are specified, the first value is for the horizontal spacing, the second value is for the vertical spacing. • In case the `-min_space_to_macro` parameter has been specified, then the value specified for the `-forbidden_space_to_macro` parameter should be less than the value specified for the `-min_space_to_macro` parameter. *Minimum=0* *Maximum=100000* *Default:* `0` *Data_type*: string, optional
`-halo_sharing {true | false}`	When enabled, abutted macros can share halos between them. **Note:** When the spacing between two macros is less than the forbidden-space-to-macro, the two macros are abutted. Since a single halo width instead of double width is enough to meet the physical rules, abutted macros can share halos between them using the new `-halo_sharing` parameter. **Note:** The halos of the abutted macros can overlap but macros cannot overlap with the halo of the other macro.  *Default:* `false` *Data_type*: enum, optional
`-help`	Outputs a brief description that includes the type and default information for each `set_macro_place_constraint` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_macro_place_constraint`
`-honor_strict_spacing_constraint{true | false}`	
	When set to true, it specifies that the forbidden spacing and minimum spacing constraints must be honored strictly. *Data_type*: enum, optional
`-horizontal_stacking {`*`max_macro_stack_length  min_space_between_macro_stack  max_space_between_macros`*`}`	

	Specifies the maximum horizontal stack depth and the minimum horizontal spacing. • *max_macro_stack_length:* Specifies that the macro stacking length should not be more than the specified value. • *min_space_between_macro_stack:* Specifies the spacing between different macro stacks. • *max_space_between_macros*: Specifies the maximum space between macros. When the macro spacing is less than the specified value, the macros are counted in the stacking length. For example, if the max_space_between_macro value is 9 then the macros will be considered as packed if the space between the macros is between 0 and 9, however, if the real space is 10 then nothing will happened. *Data_type*: string, optional
`-insts string`	Specifies the macros on which the orientation constraints are set. Refer to the `-orientation` for more information.
`-macro_corner_keepout {double_endcap_width double_endcap_height}`	
	Specifies the macro corner spacing constraints. It ensures that there is enough space between the macro corners for inserting the endcap cells properly. **Note:** The corner keepout area starts at the corner of the macro halo.  **Note:** The macro corner spacing constraints specified with this parameter are honored by the `refine_macro_place` and `check_macro_place_constraint` commands. However, if honoring the corner keepout constraint is difficult, corner abutting is allowed. **Note:** The tool reserves either the horizontal keepout larger than double corner cell width or vertical keepout larger than double corner cell height *Default*: {0,0} *Data_type*: string, optional

`-max_io_pin_group_keep_out {depth_value [side_value]}`	Specifies the maximum height and (optionally) side extension to automatically add macro-only blockages to IO pins.
	Note: The `-max_io_pin_group_keep_out` parameter automatically coordinates the size of the macro-only blockages based on the pin density and number for each group of IO pins.
	Note: Side value is optional. If you do not specify the side value, the `set_macro_place_constraint` command follows the default method to calculate the side (side = ¼ depth). If you specify the side value, the max IO group needs to follow the specified depth and side distance. The blockages of smaller IO groups will be derived automatically, keeping the same *depth/side* proportion (as described for the max IO group)
	Innovus supports the following formats:
	`set_macro_place_constraint -max_io_pin_group_keep_out depth_value`
	`set_macro_place_constraint -max_io_pin_group_keep_out {depth_value}`
	`set_macro_place_constraint -max_io_pin_group_keep_out {depth_value side_value}`
	Note: The depth and side values are specified in microns.
	Minimum=0
	Maximum=100000
	Data_type: string, optional

`-min_space_to_core {unified_value | horizontal_value vertical_value}`	
	Specifies the value for the minimum spacing between macro and core boundary. If the space between the macro and core is smaller than this value and larger than the forbidden space, then the macros are pushed away from the core to minimum space. **Note:** If only one unified value is specified, both horizontal and vertical spacings use the same value. If two values are specified, the first value is for the horizontal spacing, the second value is for the vertical spacing. *Minimum=0* *Maximum=100000* *Default:* `0` *Data_type*: string, optional
`-min_space_to_macro {unified_value | horizontal_value vertical_value}`	

	Specifies the value for the minimum spacing between macro to macro boundary. If the space between the macros is less than this value, then the macros are aligned.
	Note: If only one unified value is specified, both horizontal and vertical spacings use the same value. If two values are specified, the first value is for the horizontal spacing, the second value is for the vertical spacing.
	For Example:
	• In the following command, both horizontal and vertical spacing use the same value.
	`set_macro_place_constraint -min_space_to_macro 10`
	• In the following command, the first value is for horizontal spacing, the second value is for vertical spacing.
	`set_macro_place_constraint -min_space_to_macro {10 20}`
	Minimum=0
	Maximum=100000
	Data_type: string, optional

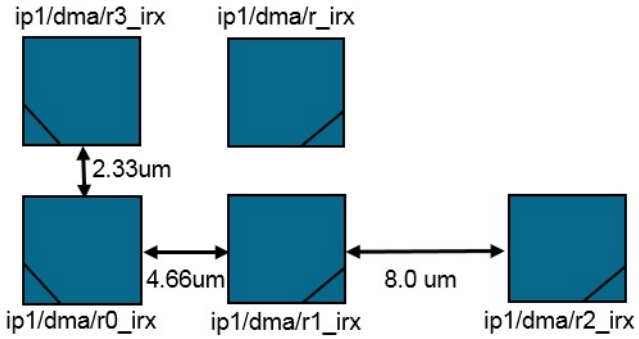
`-orientation string`	Specifies the allowed orientation for the macros. The macro instances on which you want to constrain the orientations can be specified by -insts or -all_macros **Note:** Specified orientation overwrites the previous definition. Example: `set_macro_place_constraint -all_macros -orientation {R90 MX90 MY90 R270}` *Data_type*: string, optional

`-parallel_run_length` *float*	Specifies the parallel run length to enable space checking. When the parallel run length of macros is larger than the specified parallel run length value, macro-to-macro space checking will be enabled. **Note:** When the `-parallel_run_length` parameter is specified along with the `-horizontal_stacking` or `-vertical_stacking` parameters, only the macros with parallel run length >= the specified value will be counted in the stacking length. *Minimum=0* *Maximum=100000* *Data_type*: float, optional
`-pg_resource_model {`*M1 value1 M2 value2 …*`}`	
	Specifies the pg resource model for concurrent macro placement. During the concurrent macro placement the power mesh does not exist. This parameter allows you to mimic the number of routing tracks occupied by the real power mesh to make the congestion analysis more accurate during the concurrent macro placement. **Note:** This setting is generated automatically by the `create_pg_model_for_macro_place` command. It is highly recommended to use this command to define the `-pg_resource_model` parameter. *Data_type*: string, optional
`-place_order {horizontal | vertical}`	Specifies the place order in row (horizontal) or column (vertical) first for macro array. *Default*: `horizontal` *Data_type*: enum, optional
`-same_length_site` *integer*	Specifies the minimum number of sites between the vertical edge of two macros. *Minimum=0* *Maximum=100000* *Data_type*: int, optional
`-track_adjustment {{`*layer1 density1*`} {`*layer2 ….*`}}…`	Specifies the layer density to add track adjustment on each macro. For each routing layer and each macro, if the PG density over a macro is lower than the standard cell area then it increases the track resource in macro area to mimic the lower PG density. **Note:** This setting is generated automatically by the `create_pg_model_for_macro_place` command. It is highly recommended to use this command to define the `-cell_obs` parameter. *Data_type*: string, optional
`-valid_group_orients {R0 MX MY}`	Specifies the valid orientations for the whole group. *Data_type*: enum, optional
`-vertical_stacking {`*max_macro_stack_length min_space_between_macro_stack max_space_between_macros*`}`	
	Specifies the maximum vertical stack depth and the minimum vertical spacing. • *max_macro_stack_length:* Specifies that the macro stacking length should not be more than the specified value. • *min_space_between_macro_stack:* Specifies the spacing between different macro stacks. • *max_space_between_macros*: Specifies the maximum space between macros. When the macro spacing is less than the specified value, the macros are counted in the stacking length. For example, if the max_space_between_macro value is 9 then the macros will be considered as packed if the space between the macros is between 0 and 9, however, if the real space is 10 then nothing will happened. *Data_type*: string, optional

Example

- The following command creates a macro array, ram_array, and defines it constraints.

```
set_macro_place_constraint -array ram_array {{ip1/dma/r0_irx:R0 4.66 ip1/dma/r1_irx:MY 8.0 ip1/dma/r2_irx:MY} 2.33 {ip1/dma/r3_irx:R0 4.66 ip1/dma/r_irx:MY}} -valid_group_orients {R0 MY}
```



Related Information

set_trace_obj_connectivity_mode

```
set_trace_obj_connectivity_mode
[-help]
[-reset]
[-macro_pins list_of_pins]
[-max_fanin_fanout number]
[-register_inputs list_of_pins]
[-register_outputs list_of_pins]
```

Controls certain aspects of how the connections of specified macros, selected macros, or specified ports are traced. It enables you to set the trace mode such as register pins, macro pins, and maximum fanin and fanout. Use the `get_trace_obj_connectivity_mode` command to return the current settings for the `set_trace_obj_connectivity_mode` command. The `set_trace_obj_connectivity_mode` parameters affects the behavior the `trace_obj_connectivity` command. You can use this command after importing the design and before using the `trace_obj_connectivity` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_trace_obj_connectivity_mode` parameter. For a detailed description of the command and all of its parameters, use the man command: `man` set_trace_obj_connectivity_mode
`-macro_pins` *list_of_pins*	Specifies the macro pin name patterns. *Default*: " " *Data_type*: string
`-max_fanin_fanout` *number*	Specifies the maximum fanin/fanout number for a pin. While tracing the connectivity, a pin will be ignored if its fanin/fanout number is larger than the specified number. *Default*: 1000 *Data_type*: int
`-register_inputs` *list_of_pins*	Specifies the register input pin names. *Default*: " " *Data_type*: string
`-register_outputs` *list_of_pins*	Specifies the register output pin names. *Default*: " " *Data_type*: string
`-reset`	Restores all parameters modified using `set_trace_obj_connectivity_mode` to their default settings. The `-reset` parameter must be the first parameter specified. If you specify -reset by itself, the software resets all `set_trace_obj_connectivity_mode` parameters to their default values. If you specify parameters after -reset, the software resets only those parameters to their default values. Any values that do not already match the default value and are reset will be reported.

Example

The following command set the maximum fanin/fanout number for pins to 200:

```
set_trace_obj_connectivity_mode -max_fanin_fanout 200
```

setBottomIoPadOrient

```
setBottomIoPadOrient
[-help]
orient
```

Changes the orientation for the bottom pad (South side). Changing the bottom pad orientation changes the pad relationship of the East, North, and West side pads. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setBottomIoPadOrient` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setBottomIoPadOrient`
orient	Specifies the orientation. The possible orientation values are R0, R90, R180, and R270. *Data_type*: string, required

Example

The following command changes the orientation of the bottom I/O pad instances from R0 to R270 for the bottom pad (South side):

```
setBottomIoPadOrient R270
```

As a result, the respective orientation of the I/O pad instances change on the East (R270 to R180), North (R180 to R90), and West (R90 to R0) sides.

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

setDrawView

```
setDrawView
[-help]
mode
```

Sets the design view in the design display area. You can use this command after importing or restoring the design. To see the current view use `getDrawView`.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setdrawView` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setDrawView`
mode	Sets the mode. • `amoeba`: Sets the view to Amoeba view. This view displays the outline of the modules and submodules after placement, showing physical locality of the module. • `fplan`: Sets the view to floorplan view. This view displays the hierarchical module and block guides, connection flightlines, and floorplan objects, including block placement, and power and ground nets. • `place`: Sets the view to physical view. This view displays the detailed placements of the module's blocks, standard cells, nets, and interconnects. *Data_type*: string, required

setFinishFPlanMode

```
setFinishFPlanMode
[-help]
[-reset]
[-abuttedEdgeAsNonRowArea {true|false}]
[-activeObj {macro|macroHalo|core|iopad|iocell|fence|hardblkg|softblkg|partialblkg|routeblkg|routingblkg|row}]
[-direction {x|y|xy}]
[-drcRegionObj {macro|macroHalo|hardBlkg|minGap|coreSpacing|nonRowArea}]
[-override {true|false}]
```

Set the active objects and specifies the channel direction for the `finishFloorplan` command to use whenever you perform advanced placement-related refinements to a floorplan. Use the `getFinishFPlanMode` command to return the current settings for the `setFinishFPlanMode` command. The `setFinishFPlanMode` parameters affects the behavior the `finishFloorplan` command.

Parameters

`-abuttedEdgeAsNonRowArea {true|false}`

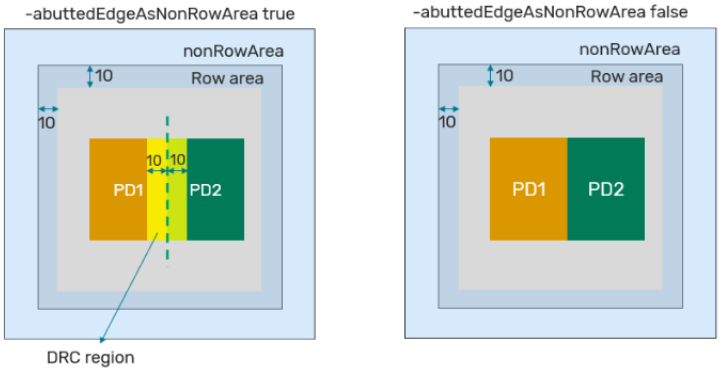
Specifies whether the abutted edge of a power domain should treated be as nonRowArea.

- `true`: The abutted edge of the power domain is treated as nonRowArea with size 0 by default. The tool creates a
- `false`: The abutted edge of the power domain is excluded from nonRowArea. The tool then does not create a DR

Note: This option can only be specified when the `-drcRegionObj nonRowArea` parameter option is also specified.

For example:

```
setFinishFPlanMode -drcRegionObj nonRowArea -abuttedEdgeAsNonRowArea {true|false}
finishFloorplan -drcRegionLayer M1 -edgeExtend {10 10}
```



Default: `true`

Data_type: bool

`-activeObj {macro|macroHalo|core|iopad|iocell|fence|hardblkg|softblkg|partialblkg|routeblkg|routingblkg|row}`

	Specifies the active object list. The boundaries of the specified active objects are looked at while deciding where to objects can be: • `core` • `macro` • `macroHalo` • `ioCell` • `ioPad` • `fence` • `hardblkg` • `softblkg` • `partialblkg` • `routeblkg` • `routingblkg` • `row` *Default*: `core macro macroHalo` *Data_type*: enums={macro macroHalo core iopad iocell fence hardblkg softblkg partialblkg routeblkg row}_list
`-help`	Outputs a brief description that includes the type and default information for each `setFinishFPlanMode` parameter. For a detailed description of the command and all of its parameters, use the man command `man setFinishFPlanMod`
`-direction {x | y | xy}`	Specifies the direction in which the blockage is added. You specify one of the following options: • `x`: Fills the channel whose height is less than width. • `y`: Fills the channel whose width is less than height. • `xy`: Fills every channel whose smallest size (in X or Y direction) is within Max Gap range. *Default*: `xy` *Data_type*: enums={x y xy}
`-drcRegionObj {macro|macroHalo|hardBlkg|minGap|coreSpacing|nonRowArea}`	
	Specifies the drc region object list. The boundaries of the specified drc region objects are looked at while deciding w • `coreSpacing` • `hardBlkg` • `macro` • `macroHalo` • `minGap` • `nonRowArea` *Default*: `macro macroHalo hardBlkg minGap coreSpacing` *Data_type*: enums={macro macroHalo hardBlkg minGap coreSpacing nonRowArea}_list
`-override {true | false}`	
	Overrides old blockages that overlap with the new blockages. *Default*: `false` *Data_type*: bool
`-reset`	Restores all parameters modified using `setFinishFPlanMode` to their default settings. The `-reset` parameter must be to their default values. If you specify parameters after `-reset`, the software resets only those parameters to their defa

Example

- The following commands specify the region layer name list for creating a region layer for the specified DRC region object:

```
setFinishFPlanMode -drcRegionObj macro
finishFloorplan -drcRegionLayer R1
```

Related Information

- `finishFloorplan`

- "Finish Floorplan" in the *Innovus Menu Reference*

setFixedBlockSize

```
setFixedBlockSize
[-help]
name_list
```

Specifies that during floorplan resizing, the size of the specified modules and/or blackboxes should not change. Use this command before specifying the floorplan.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setFixedBlockSize` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setFixedBlockSize`
`name_list`	Specifies that the size of the *specified* modules and/or blackboxes should not change during floorplan resizing. Provide a space-separated list of instances. *: Specifies that the size of *all* the modules and/or blackboxes should not change during floorplan resizing. *Data_type*: list, required

Example

The following command specifies that the size of `instanceA` and `instanceB` should not change during floorplan resizing.

```
setFixedBlockSize instanceA instanceB
```

Related Information

- `unsetFixedBlockSize`
- Floorplanning the Design chapter in the *Innovus User Guide*

setFlipping

```
setFlipping
[-help]
flip_type
```

Specifies the orientation of the bottom row in the core area. The command recreates all the floorplan rows. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setFlipping` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setFlipping`
flip_type	Specifies the type of orientation. • `f`: Specifies that the first row flips from the bottom up. • `n`: Specifies that no row flipping is done. • `s`: Specifies that the second row flips from the bottom up. **Tip:** To get the flipping value set by the `setFlipping` command, use the following: `dbGet top.fplan.flipRows` *Data_type*: string, required

Examples

- If the existing orientation of the bottom row is Mx and the second row from bottom is R0, then the following command changes the second row orientation to Mx and changes the orientation of the other rows accordingly (Bottom row orientation will be R0).
  ```
  setFlipping s
  ```
- If the existing orientation of the bottom row is R0 and second row from bottom is Mx, then the following command changes the first row orientation to Mx and changes the orientation of the other rows accordingly (second from bottom row orientation will be R0):
  ```
  setFlipping f
  ```

```

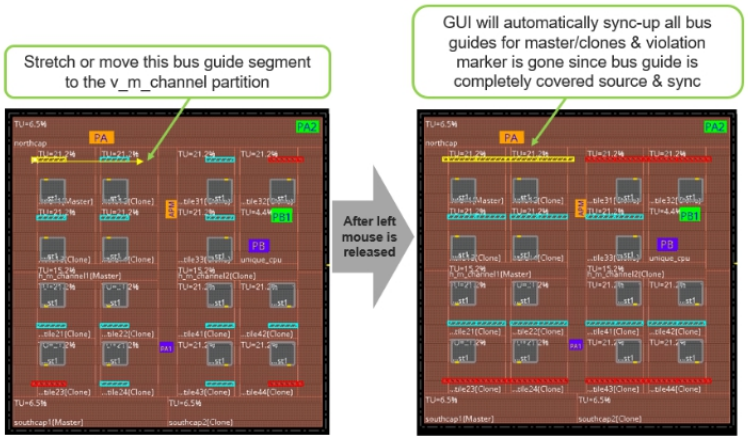
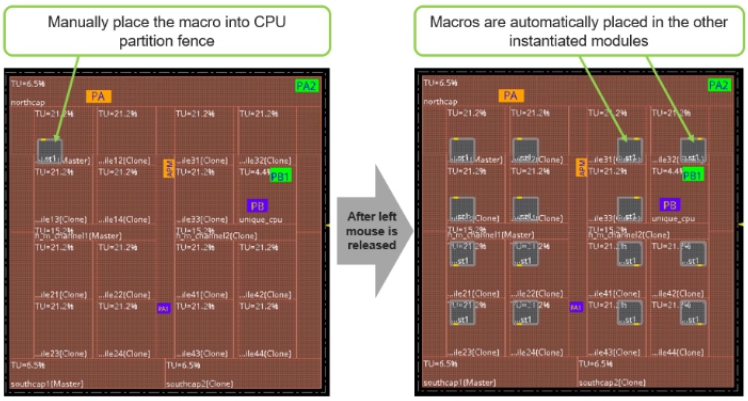
Sets the global parameters of the check floorplan feature. Use the `getFPlanMode` command to return the current settings for the `setFPlanMode` command. The `setFPlanMode` parameters affects the behavior the `checkFPlan` command. You can use this command after importing the design and before using the `checkFPlan` command.

Parameters

`-autoSyncMasterClone {busGuides|constraints|stdcells|macros}`	
	Specifies the objects that automatically sync up between master and clone partitions during add, delete, edit, move, flip, rotate, unplace, or stretch operations. The sync-up object can be bus guides, standard cells, macros, constraints (fence/guide/region), placement blockages, routing blockages, or special wires. • `busGuides`: Any change (add, delete, edit, move, or stretch) for busGuides in master will sync-up to other hinsts that have the same module. For example, `setFPlanMode -autoSyncMasterClone {busGuides}`



- `constraints`: Any change (add, delete, move, reshape) in fence/guide/region of master will sync-up to other hinsts that have the same module.
  - When constraints is not specified, tool will not sync-up any change of fence/guide/region between master and clones.
  - When constraints is specified, tool will auto sync-up any change of fence/guide/region between master and clones when doing moving/stretching/add/delete/edit.
- `stdcells`: Any change (add, delete, edit, move, flip, rotate, or unplace) in standard cells will sync-up to other hinsts that have the same module.
  For example, `setFPlanMode -autoSyncMasterClone {stdcells}`
- `macros`: Any change (add, delete, edit, move, flip, rotate, or unplace) in hard macros in master will sync-up to other hinsts that have the same module.
  For example, `setFPlanMode -autoSyncMasterClone {macros}`



Default: `" "`

Data_type: `enums={busGuides constraints stdcells macros}_list`

`-cellsForExtraSites` *cell_name*	Specifies the cell names for which the additional sites will be created. These sites can be used up later in the flow. *Default*: `" "` *Data_type:* string

```
-checkTypes {basic|fence|oddEvenSiteRow|macroPin|color|alignmentFollowingPin|alignmentPartitionClone|
  busGuideConnectivity|feedThrough|partitionInPartition|multiLayerPin|powerDomain|
  partition|place|sameLengthSite|narrowChannel|blockOnly|unifiedVddOnBottom|all}
```

	Specifies the check types for the `checkFPlan` command. • `basic`: Checks the basic quality of the floorplan to detect potential problems before the design is passed on to other tools. • `fence`: Checks the fences. • `oddEvenSiteRow`: Checks odd or even site row. It checks if the current row fits to the setting of `setFPlanMode -rowSiteWidth` and `-rowSiteHeight`. • `macroPin`: Checks if the macro pins are off track. • `color`: Checks the color issues of all floorplan objects, such as pins, preRoutes, prePlacedInst, etc. • `alignmentFollowingPin`: Checks if the centerline of the followpin is the same as the row's border and matches the power attribute. • `alignmentPartitionClone`: Checks that partition clones are aligned with their master on the power mesh. This checks that the master and clones partitions are inside a core boundary, and ensures that the partition fence instances sizes match the master instance. • `busGuideConnectivity`: Checks incorrect overlapping and connectivity. • `feedThrough`: Checks feedthrough buffer insertion. • `partitionInPartition`: Checks if child partitions reside inside parent partitions. • `multiLayerPin`: Checks multi layer pins. • `powerDomain`: Checks the power domains. • `partition`: Checks the partitions. • `place`: Checks the placement. • `sameLengthSite`: Checks the same length site rule where, in a group of continuous poly stripes with the same length, the number of sites must be >= N.(N is specified by the `-minimumSites` option.) • `narrowChannel`: Checks for narrow channels. • `blockOnly`: Checks for performance most frequently used in block implementation. Includes: basic, oddEvenSiteRow, macroPin, and color. • `unifiedVddOnBottom`: Checks whether all the cells in the design are with the same vdd on bottom. • `all`: Performs all checks on the floorplan to detect potential problems before the design is passed on to other tools. *Default*: `basic` *Data_type:* enums={basic fence oddEvenSiteRow macroPin color alignmentFollowingPin alignmentPartitionClone busGuideConnectivity feedThrough partitionInPartition multiLayerPin powerDomain partition place sameLengthSite narrowChannel blockOnly unifiedVddOnBottom all}_list
`-cutOffPlaceBlockageOutsideDie {true|false}`	When creating placement blockages, it cuts the part outside of die and snaps it by default. *Default*: `true` *Data_type:* bool
`-cutOffRouteBlockageOutsideDie {true|false}`	When creating routing blockages around inst/Hinst/Partition, it cuts the part outside of die and snaps it by default. If this option is set to false, then the outside part is not cut and snapped. *Default*: `true` *Data_type:* bool
`-defaultBlockageNamePrefix` *string*	Specifies the name prefix for placement blockage and routing blockage. *Default*: " " *Data_type:* string

`-defaultPowerDomainSite {true | false }`	Creates rows based on the default power domain site instead of the the default site of the design. *Default*: `false` *Data_type:* bool
`-defaultRowPatternSite string`	Specifies the default ROWPATTERN site. **Note:** Defined in the LEF, a ROWPATTERN site is a set of previously defined sites and their orientations. This site is defines a placement site in the design. *Default*: " " *Data_type:* string
`-defaultTechSite string`	Specifies a site as default technical site. **Note**: After setting a default technical site, the auto-calculating default-technical-site functionality is disabled. **Note**: The `saveFPlan`, `loadFPlan`, `initCoreRow` and `checkFPlan` commands honor the default technical site specified using the `setFPlanMode -defaultTechSite` parameter. *Default*: auto-calculated default-technical-site by tool. *Data_type:* string
`-enableRectilinearDesign {true | false}`	Specifies whether the design boundary can be changed to rectilinear shape. *Default*: `false` *Data_type:* bool
`-extraSites site_name`	Specifies the name for the additional sites that will be created for cells which are not used in the netlist by default. These sites can be used up later in the flow. **Note**: Sites for all specified cells should be defined in the LEF. *Default*: `" "` *Data_type:* string
`-firstRowSiteIndex int`	Specifies the index number in default row site pattern as the first row for creating hybrid rows. For example, *Default*: 0 *Data_type:* int
`-help`	Outputs a brief description that includes the type and default information for each `setFPlanMode` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setFPlanMode.`
`-includeIoWhenInitArea {true|false}`	Includes IO cells when calculating the area of modules. *Default*: `false` *Data_type:* bool
`-initAllCompatibleCoreSiteRows {true|false}`	When enabled, initCoreRow creates SITES which are used by all cells in the library. *Default*: `false` *Data_type:* bool
`-keepRowsWhenMovingPowerDomain {true|false}`	Specifies whether to keep all existing rows in power domain when moving, resizing or reshaping a power domain on GUI or by command. *Default*: `false` *Data_type:* bool
`-lastRowSiteIndex int`	Specifies the index number in default row site pattern as the last row for creating hybrid rows. *Default*: -1 *Data_type:* int

`-maxIoHeight {true|false}`	When specified, the maximum IO height is used to calculate a die box with IO placement. By default, the minimum IO height is used. *Default*: `false` *Data_type:* bool
`-minimumSites` *value*	Specifies the number of minimal sites (N) that the `checkFPlan` command will check for the same length site rule. When the `sameLengthSite` option of the `-checkTypes` parameter is specified, this parameter is required. *Default*: `0` *Data_type:* int
`-move_macros_with_constraint {guide|region|fence|none|all}`	
	Specifies that the macros move with the constraint modules at the same time. *Default*: `fence` *Data_type:* `enums={guide region fence none all}_list`
`-move_preplaced_std_cell_only {true|false}`	Specifies that only the pre-placed standard cells can move with the constraint modules at the same time. *Default*: `false` *Data_type:* bool
`-move_std_cell_with_constraint {guide|region|fence|none|all}`	
	Specifies that standard cells move with the constraint modules at the same time. *Default*: `none` *Data_type:* `enums={guide region fence none all}_list`
`-narrowChannelThreshold` *value*	Reports the narrow channels whose width (in micros) is smaller than the specified value. When the `narrowChannel` option of the `-checkTypes` parameter is specified, this parameter is required. *Default*: `0` *Data_type:* float
`-no_cut_row {true|false}`	Specifies that the rows are not required to be cut before other operations. The following commands honor this mode setting: • `createRouteBlkAlongTrack` • `check_ufc` • `fix_floorplan` • `finishFloorplan` With the `-no_cut_row` parameter set to `false` or not specified, the tool will run above the mentioned commands based on the current row shape. So the rows for objects like insts, place blockages are expected to be cut out before running these commands to get expected results. If rows are not cut before run these commands are run and the `-no_cut_row` parameter is set to `true`, the tool will identify the rows that have not been cut before running these commands. It calls the `cutRow` command to get a cut row shape during these commands action. The `cutRow` command cuts the rows for insts, hinsts, place blockages, route blockages, power domains, groups, or bumps by default. These commands will work based on the cut row shape. But the actual row shape is not changed after these operations. *Default*: `false` *Data_type:* bool
`-powerRailLayer` *string*	Specifies the layers used for calculating the power/ground on the bottom attribute of the cell or techsite. By default, the lowest metal layer is used. *Default*: " " *Data_type:* string

`-reset`	Restores all parameters modified using `setFPlanMode` to their default settings. The `-reset` parameter must be the first parameter specified. If you specify -reset by itself, the software resets all `setFPlanMode` parameters to their default values. If you specify parameters after `-reset`, the software resets only those parameters to their default values. Any values that do not already match the default value and are reset will be reported.
`-rowHeightIncrementCornerToCorner` *`CornerToCornerValue`*	
	Specifies the offset value for user defined row height constraint with corner to corner edge. *Default*: 0 *Data_type:* int
`-rowHeightIncrementIncornerToCorner` *`IncornerToCornerValue`*	
	Specifies the offset value for user defined row height constraint with incorner to corner edge. *Default*: 0 *Data_type:* int
`-rowHeightIncrementIncornerToIncorner` *`IncornerToIncornerValue`*	
	Specifies the offset value for user defined row height constraint with incorner to incorner edge. *Default*: 0 *Data_type:* int
`-rowHeightMultiple` *`multipleHeightValue`*	Specifies the pitch value for user defined row height constraint. *Default*: 0 *Data_type:* int
`-rowSiteHeight {any|odd|even|computed}`	Specifies the odd, even, or user defined row height constraints. **Note:** For a hybrid row design, specify the `computed` option for the `-rowSiteHeight` parameter to specify the row constraints. *Default*: `any` *Data_type:* enums={any odd even computed}
`-rowSiteWidth {any|odd|even}`	Specifies the odd even row width constraints. *Data_type:* enums={any odd even}

`-skipViolations` *`string`*	Skips reporting and showing the violation(s) associated with the specified message ID(s) in the violation browser.
	Note: You can specify a list of message IDs with the `-skipViolations` parameter. It also supports wildcards.
	• If the `-skipViolations` parameter is not specified, the tool reports all the violations checked by the `checkFPlan` command in the terminal/.log/.logv and shows them in the violation browser if there is marker box.
	• If the `-skipViolations` parameter is specified, the tool does not report the violations in terminal/.log/.logv and also does not show them in the violation browser even through there is marker box.
	For example, the following command does not report the violations for IMPFP-7236.
	`setFPlanMode -checkTypes basic -skipViolations IMPFP-7236`
	`checkFPlan`
	Default: `" "`
	Data_type: string

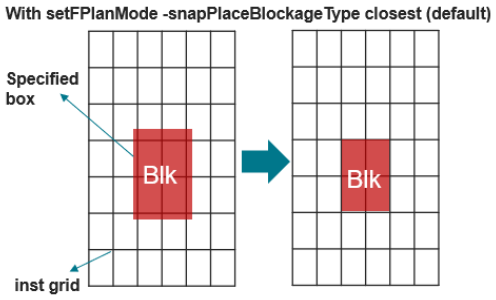
`-snap_all_corners_to_grid {true|false}`	Snaps all corners of an object to the grid. It defines the snapping behavior for the kinds of objects: constraint, ptnCut and black box. **Note**: This option only works when the snapping grid is user defined grid or FinFET grid. • When the snapping grid is ManufactureGrid, the object is snapped to the closest grid. • When the snapping grid is InstanceGrid and PlacementGrid, the object is moved to first snap the LL corner to the closest location and then to snap the UR corner to closest location. • When the snapping grid is user defined grid, the object is moved to snap the LL corner to the closest location. Then if the `-snap_all_corners_to_grid` parameter set to true, the object is moved to snap the UR corner to the closest location. • When the snapping grid is FinFET grid and the `-snap_all_corners_to_grid` parameter set to true, all corners of the object are snapped to the closest grid. However, if the `-snap_all_corners_to_grid` parameter set to false, only the LL corner of the object is snapped to the closest location. *Default*: `false` *Data_type:* bool
`-snapBlockGrid {manufacturing | inst | placement | userDefine | LayerTrack | finfetInst | finfetManufacturing | finfetPlacement }`	
	Specifies the block snap rules. It can be set to snap to: • `manufacturing`: Manufacture Grid • `inst`: Instance Grid • `placement`: Placement Grid • `userDefine`: User-define Grid • `LayerTrack`: LayerTrack Grid • `finfetManufacturing`: FinFET Manufacture Grid • `finfetInst`: FinFET Instance Grid • `finfetPlacement`: FinFET Placement Grid *Default*: `manufacturing` **Note**: For FinFET designs, the default is `finfetManufacturing`. *Data_type:* enums={manufacturing inst placement userDefine LayerTrack finfetInst finfetManufacturing finfetPlacement}
`-snapConstraintGrid {manufacturing | inst | placement | userDefine | LayerTrack | finfetInst | finfetManufacturing | finfetPlacement }`	
	Specify the constraint snap rules. It can be set to snap to: • `manufacturing`: Manufacture Grid • `inst`: Instance Grid • `placement`: Placement Grid • `userDefine`: User-define Grid • `LayerTrack`: LayerTrack Grid • `finfetManufacturing`: FinFET Manufacture Grid • `finfetInst`: FinFET Instance Grid • `finfetPlacement`: FinFET Placement Grid *Default*: `inst` **Note**: For FinFET designs, the default is `finfetInst`. *Data_type:* enums={manufacturing inst placement userDefine LayerTrack finfetInst finfetManufacturing finfetPlacement}
`-snapCoreGrid {manufacturing | inst | placement | userDefine | LayerTrack | finfetInst | finfetManufacturing | finfetPlacement }`	

	Specifies the core snap rules. It can be set to snap to: • `manufacturing`: Manufacture Grid • `inst`: Instance Grid • `placement`: Placement Grid • `userDefine`: User-define Grid • `LayerTrack`: LayerTrack Grid • `finfetManufacturing`: FinFET Manufacture Grid • `finfetInst`: FinFET Instance Grid • `finfetPlacement`: FinFET Placement Grid *Default*: `placement` **Note**: For FinFET designs, the default is `finfetPlacement`. *Data_type:* enums={manufacturing inst placement userDefine LayerTrack finfetInst finfetManufacturing finfetPlacement}
`-snapDieGrid {manufacturing | inst | placement | userDefine | LayerTrack | finfetInst | finfetManufacturing | finfetPlacement }`	
	Specifies the die snap rules. It can be set to snap to: • `manufacturing`: Manufacture Grid • `inst`: Instance Grid • `placement`: Placement Grid • `userDefine`: User-define Grid • `LayerTrack`: LayerTrack Grid • `finfetManufacturing`: FinFET Manufacture Grid • `finfetInst`: FinFET Instance Grid • `finfetPlacement`: FinFET Placement Grid *Default*: `placement` **Note**: For FinFET designs, the default is `finfetPlacement`. *Data_type:* enums={manufacturing inst placement userDefine LayerTrack finfetInst finfetManufacturing finfetPlacement}
`-snapIoGrid {manufacturing | inst | placement | userDefine | LayerTrack | finfetInst | finfetManufacturing | finfetPlacement }`	
	Specifies the IO snap rules. It can be set to snap to: • `manufacturing`: Manufacture Grid • `inst`: Instance Grid • `placement`: Placement Grid • `userDefine`: User-define Grid • `LayerTrack`: LayerTrack Grid • `finfetManufacturing`: FinFET Manufacture Grid • `finfetInst`: FinFET Instance Grid • `finfetPlacement`: FinFET Placement Grid *Default*: `manufacturing` **Note**: For FinFET designs, the default is `finfetManufacturing`. *Data_type:* enums={manufacturing inst placement userDefine LayerTrack finfetInst finfetManufacturing finfetPlacement}

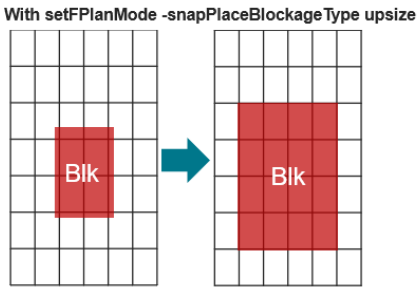
`-snapPlaceBlockageGrid {manufacturing|inst|finfetInst|finfetManufacturing|userDefine}`	
	Specifies the placement blockage snap rules. • `manufacturing`: Manufacture Grid • `inst`: Instance Grid • `userDefine`: User-define Grid • `finfetManufacturing`: FinFET Manufacture Grid • `finfetInst`: FinFET Instance Grid *Default*: `inst` *Data_type:* enums={manufacturing inst finfetInst finfetManufacturing userDefine}
`-snapPlaceBlockageType {closest|upsize|sequential}`	

Specifies a snapping type for placement blockages. The snapping types can be:

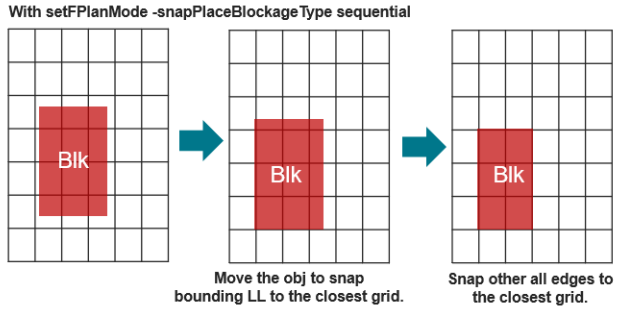
- `closest`: The tool snaps all corners of the placement blockage to the closest specified grid, regardless of which direction could increase or decrease the blockage size.



- `upsize`: The tool snaps all corners of the placement blockage to the corresponding closest specified grid in the direction which would increase the objects' size.



- `sequential`: The tool moves the placement blockage to snap the low-left corner to the closest specified grid, then snaps the upper-right corner to the closest grid.



This setting is honored by the following commands:

- `setObjFPlanBox`
- `setObjFPlanBoxList`
- `setObjFPlanPolygon`
- `createPlaceBlockage {-box|-boxList|-polygon}`
- `snapFPlan -placeBlk`

Default: `closest`

Data_type: enums={closest upsize sequential}

`-user_define_grid {x_offset y_offset x_pitch y_pitch}`

	Specifies the user-defined grid. The format is {*x_offset y_offset x_pitch y_pitch*}. Where, *x_offset y_offset* is the offset of the user-defined grid. *x_pitch* separates the vertical grid lines. *y_pitch* separates the horizontal grid lines. **Note:** The values are in microns. *Default*: {0 0 0 0} *Data_type:* box

Examples

In the following, the command checks the same length site rule in a group of continuous poly stripes with the same length. The number of minimal sites it check is set to 6 using the `-minimumSites` parameter.

```
setFPlanMode -checkTypes sameLengthSite -minimumSites 6
```

setFPlanRowSpacingAndType

```
setFPlanRowSpacingAndType
[-help]
spacing
type
```

Specifies the standard row spacing values and row pattern type. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setFPlanRowSpacingAndType` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setFPlanRowSpacingAndType`
spacing	Specifies the standard row spacing, in micrometers. This must be a positive value. *Default*: 0 *Data_type*: float, required
type	Specifies the row spacing type. Specify 1 for every row, or 2 for every other row to apply the spacing value. *Data_type*: int, required

Example

The following command specifies a row spacing value of 1.1 micrometers for every other row:

```
setFPlanRowSpacingAndType 1.1 2
```

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*
  - `Standard Row Spacing

setInstancePlacementStatus

```
setInstancePlacementStatus
[-help]
{-allHardMacros | -allPtnBlks |-allBlackBoxes | -name instName(s)}
[-status {unplaced | fixed | placed | cover | softFixed}]
```

Changes the placement attributes status for all hard macros, all partition blocks, all blackboxes, or selected instances. This allows you to fix all blocks so they are not moved by `place_design`.

Parameters

`-allHardMacros`	Applies the status option only to all hard macros. *Data_type*: bool, required
`-allPtnBlks`	Applies the status option only to all partition blocks. *Data_type*: bool, required
`-allBlackBoxes`	Applies the status option only to all blackboxes. *Data_type*: bool, required
`-help`	Outputs a brief description that includes type and default information for each `setInstancePlacementStatus` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setInstancePlacementStatus`
`-name instName(s)`	Applies the status options to the specified instance(s). You can use a wildcard to specify multiple instances. *Data_type*: string, required
`-status {unplaced | fixed | placed | cover` | softFixed}	
	Specifies the change in placement status for instances. • `unplaced`: Specifies the change in placement status to be an *unplaced* status. The unplaced component does not have a location. • `fixed`: Specifies the change in placement status to a *fixed* status. The fixed component has a location and cannot be moved by automatic tools, but can be moved using interactive commands. • `placed`: Specifies the change in placement status to a *placed* status. The placed component has a location, and can be moved using automatic tools and interactive commands. • `cover`: Specifies the change in placement status to a *cover* status. The cover component has a location, but cannot be moved by automatic tools or interactive commands. • `softFixed`: Specifies the change in placement status to a *softFixed* status. The softFixed placement status means that instances cannot be moved by global placement and can only be moved by the legalization step of detail placement. Instances with this status can also be upsized by optimization. *Data_type*: enum, required

Example

The following commands set all hard macros and blackboxes to `fixed`. By setting this status, `place_design` can run without moving these fixed blocks.

```
setInstancePlacementStatus -allHardMacros -status fixed
setInstancePlacementStatus -allBlackBoxes -status fixed
```

setInstGroupPhyHier

```
setInstGroupPhyHier
[-help]
groupName
```

Sets a pre-existing instance group into a physical hierarchy where you can generate a corresponding netlist. You can use this command after creating a group name.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setInstGroupPhyHier` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setInstGroupPhyHier`
`groupName`	Specifies the name of the created group. *Data_type*: string, required

Example

The following commands create and set the instance group `adder1` as a physical hierarchy:

```
createInstGroup adder1
setInstGroupPhyHier adder1
```

Related Information

- `createInstGroup`
- Floorplanning the Design chapter in the *Innovus User Guide*

setIoFlowFlag

```
setIoFlowFlag
[-help]
{0 | 1}
```

Sets the flag to use I/O row flow for pad placement. To view the current flag setting, use the `getIoFlowFlag` command. You can use this command in the floorplanning stage. You can use this commands before creating I/O rows for I/O row based pad placement.

Parameters

`{0 | 1}`	Specify 1, to use the I/O row flow. Specify 0, to use the normal I/O flow. *Data_type*: int, required
`-help`	Outputs a brief description that includes type and default information for each `setIoFlowFlag` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setIoFlowFlag.`

Examples

- The following command enables you to start using the I/O row flow in Innovus:
  ```
  setIoFlowFlag 1
  ```

Related Information

- `getIoFlowFlag`
- `createIoRow`
- Floorplan Menu chapter in the *Innovus Menu Reference*

- Data Preparation chapter in the *Innovus User Guide*
  - Creating an I/O Assignment Flow

setIoRowMargin

```
setIoRowMargin
[-help]
side
row
margin
```

Sets the distance from the die boundary edge to the I/O row starting edge location. You can use this command for multiple I/O rows.

Note: You can use the *Edit I/O Ring* form to specify I/O pad rings and row margins for multiple rows. Alternatively, to achieve the same using text commands, you must first use the `setIoRowMargin` command to set the distance from the die boundary edge to start of each row and then use the `placePadIO` command to place the I/O pads evenly between these rows.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setIoRowMargin` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setIoRowMargin`
side	Specifies the side of the I/O row margin, where n is the North side, w is the West side, s is the South side, and e is the East side. *Data_type*: string, optional
margin	Specifies the distance between the die boundary edge to the I/O row edge, in microns. *Data_type*: float, optional

row	Specifies the I/O row number. This value can be up to 8 rows. You can also use this value in conjunction with the `placePadIO` and `placePIO -optIOs` commands to specify the number of rows for placing peripheral I/O cells for the CLASS PAD and CLASS PAD AREAIO flows respectively.
	• To create and optimize multiple I/O Rows in a CLASS PAD flow, use the following commands:
	`setIoRowMargin row`
	`placePadIO`
	• To create and optimize multiple I/O Rows in a CLASS PAD AREAIO flow, use the following commands:
	`setIoRowMargin rowNumber`
	`placePIO -optIOs`
	Maximum: 1000
	Minimum: 0
	Data_type: int, optional

Example

The following command sets the North side of the second I/O row starting edge value at 300 microns from the die boundary edge to the second I/O row edge:
`setIoRowMargin n 2 300`

Related Information

setObjFPlanBox

```
setObjFPlanBox
[-help]
objectType
objectName
llx lly urx ury
```

Defines the bounding box of a specified object, even outside the core boundary. You can use this command after importing the design.

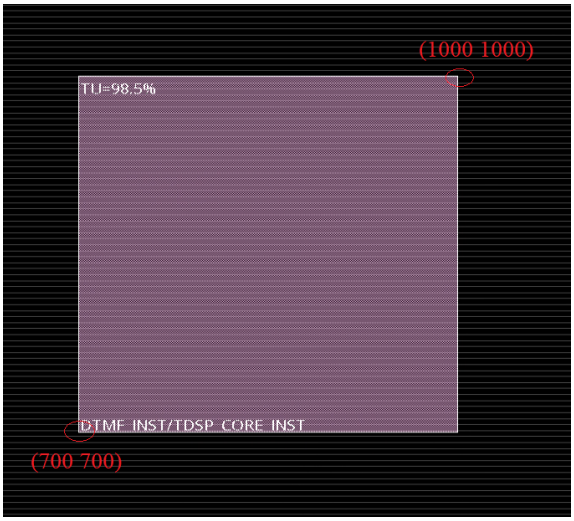
Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setObjFPlanBox` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setObjFPlanBox`
`objectName`	Specifies the name of the object for *`objectType`*. *Data_type*: string, required
`objectType`	Specifies the type of object for objectName. This can be any of the following: • Bump • Cell • Group • Instance • I/O cell • I/O pin • Layershape • Module • Net • Partition cut • Partition feedthrough • Partition pin block • Pin • Pin guide • Row cluster • Standard row *Data_type*: string, required
`llx`	Specifies the lower left x coordinate of the object. *Data_type*: float, required
`lly`	Specifies the lower left y coordinate of the object. *Data_type*: float, required
`urx`	Specifies the upper right x coordinate of the object. *Data_type*: float, required
`ury`	Specifies the upper right y coordinate of the object. *Data_type*: float, required

Example

The following command specifies a bounding box for module DTMF_INST/TDSP_CORE_INST at a lower left x coordinate of 700.00, a lower left y coordinate of 700.00, and upper right x coordinate of 1000.00, and an upper right y coordinate of 1000.00:

```
setObjFPlanBox Module DTMF_INST/TDSP_CORE_INST 700.00 700.00 1000.00 1000.00
```



Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*
  - Defining the Bounding Box

setObjFPlanBoxList

```
setObjFPlanBoxList
[-help]
{Cell | Group | Instance | Layershape | Module}
objectName
boxList
```

Defines the rectilinear shape of an object even if the object lies outside the core area. A rectilinear object comprises of two or more boxes. You can use this command after importing the design.

Parameters

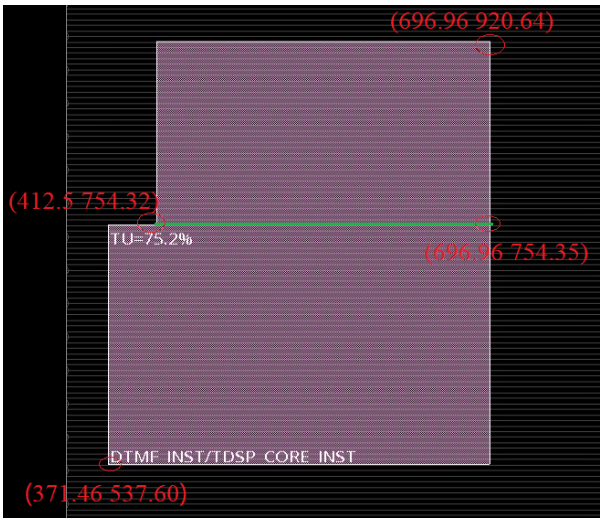
`-help`	Outputs a brief description that includes the type and default information for each `setObjFPlanBoxList` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setObjFPlanBoxList`
`objectName`	Specifies the name of the object for object type. *Data_type*: string, required
{`Cell | Group | Instance | Layershape | Module`}	
	Specifies the type of object for objectName. *Data_type*: enum, required
`boxList`	Specifies the rectilinear shape of an object. • *`llx1`*: Specifies the lower left x coordinate of the first box in the box list. • *`lly1`*: Specifies the lower left y coordinate of the first box in the box list. • *`llx2`*: Specifies the lower left x coordinate of the second box in the box list. • *`lly2`*: Specifies the lower left y coordinate of the second box in the box list. • *`urx1`*: Specifies the upper right x coordinate of the first box in the box list. • *`ury1`*: Specifies the upper right x coordinate of the first box in the box list. • *`urx2`*: Specifies the upper right x coordinate of the second box in the box list. • *`ury2`*: Specifies the upper right y coordinate of the second box in the box list. • *`llxn`*: Specifies the lower left x coordinate of the nth box in the box list. • *`llyn`*: Specifies the lower left y coordinate of the nth box in the box list. • *`urxn`*: Specifies the upper right x coordinate of the nth box in the box list. • *`uryn`*: Specifies the upper right y coordinate of the nth box in the box list. *Data_type*: list, required

Example

The following command defines a rectilinear boundary for module DTMF_INST/TDSP_CORE_INST. The rectilinear boundary is made up of two bounding boxes:

1. (371.46, 537.60) (696.96, 754.35)
2. (412.5, 754.32) (696.96, 920.64)

```
setObjFPlanBoxList Module DTMF_INST/TDSP_CORE_INST 371.46 537.60 696.96 754.35 412.5 754.32 696.96 920.64
```



Related Information

  - Defining the Bounding Box

setObjFPlanPolygon

```
setObjFPlanPolygon
[-help]
{Cell | Group | Instance | Layershape | Module }
objectName
coordList
```

Specifies a rectilinear object with polygon coordinates. The rectilinear object can take any shape depending on the number of x and y coordinates you specify. You can use this command after importing the design.

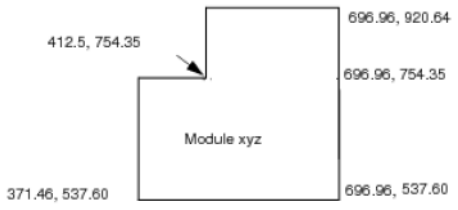
Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setObjFPlanPolygon` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setObjFPlanPolygon`
objectName	Specifies the name of the object for objectType. *Data_type*: string, required
{`Cell	Group	Instance	Layershape	Module`}	
	Specifies the type of object for objectName. This can be: • Cell • Group • Instance • Layershape • Module *Data_type*: enum, required
coordList	Specifies the corner coordinates, {*x1 y1 x2 y2 .....*}, of the rectilinear object. The rectilinear object can take any shape depending on the number of x and y coordinates you specify. *Data_type*: list, required

Example

The following command defines a rectilinear object - module xyz with five pairs of corner coordinates.

```
setObjFPlanPolygon module xyz 371.46 537.60 371.46 754.35 412.5 754.35 412.5 920.64 696.96 920.64 696.96 537.60
```



Related Information

setRailPrototypeMode

```
setRailPrototypeMode
[-help]
[-reset]
[-domain {{PD1 float net1} {PD2 float net2}..}]
[-railModel {virtual | existing}]
[-totalPower float]
```

Sets the mode for Power Aware Congestion Estimation (PACE). This helps in estimating the routability by taking into account power rail effect so that congestion estimation can be done without actually building the power plan. It supports multiple power domains specified in floorplan.

Note: `setRailPrototypeMode` command must be called before any congestion estimation command is called for it to take effect.

Parameters

`-domain {{PD1 float net1} {PD2 float net2}...}`	
	Specifies the power, in milliwatts, assigned for nets in power domains. **Note:** If the total power or the domain power is not specified, the `setRailPrototypeMode` command will estimate it internally based on the instance area. *Default*: `" "` (empty string) *Data_type*: string
`-help`	Outputs a brief description that includes the type and default information for each `setRailPrototypeMode` parameter. For a detailed description of the command and all of its parameters, use the man command `man setRailPrototypeMode`.
`-railModel {virtual | existing}`	
	Specifies the power grid to use. • `virtual`: Use routing blockages to model virtual power grid. These routing blockages are removed after congestion analysis is done. • `existing`: Use the current power grid. *Default*: `existing` *Data_type*: enums={virtual existing}
`-reset`	Restores all parameters modified using `setRailPrototypeMode` to their default settings. The `-reset` parameter must be the first parameter specified. If you specify -reset by itself, the software resets all `setRailPrototypeMode` parameters to their default values. If you specify parameters after `-reset`, the software resets only those parameters to their default values. Any values that do not already match the default value and are reset will be reported.
`-totalPower float`	
	Specifies a target value for the power, in milliwatts, consumed by the design. *Default*: `0` *Data_type*: float

Related Information

- `getRailPrototypeMode`
- Floorplanning the Design chapter in the *Innovus User Guide*

setResizeFPlanMode

```
setResizeFPlanMode
[-help]
[-reset]
[-honorHalo {true | false}]
[-maintainResourceRatioAfterResize {true | false}]
[-shrinkFence {true | false}]
[-snapToTrack {true | false}]
[-shiftBased {true | false} | -proportional {true | false} |
-congAware {true | false}]
[-ioProportional {true | false} | -ioMoveWithEdge {true | false} |
-ioFix {true | false}]
```

Controls certain aspects of how floorplan resizes the design. Use the `getResizeFPlanMode` command to return the current settings for the `setResizeFPlanMode` command. The `setResizeFPlanMode` parameters affects the behavior the `resizeFloorplan` command. You can use this command after importing the design and before using the `resizeFloorplan` command. You can resize the space among floorplan objects in three ways - proportional spacing, shift-based spacing, or congestion-based spacing.

Parameters

`-congAware {true | false}`	
	Resizes and shifts the floorplan objects by estimating the congestion for the floorplan and automatically deciding where to draw a resize line to avoid the congested area. *Default*: `false` *Data_type*: bool
`-help`	Outputs a brief description that includes the type and default information for each `setResizeFPlanMode` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setResizeFPlanMode.`
`-honorHalo {true | false}`	
	Honors placement halo and preserves the space between macros held by halo after the floorplan resize. With this option set to true, if the original placement halo does not overlap with other macros or placement halo, after `resizeFP`, it will not overlap with other macros or placement halo. *Default*: true *Data_type*: bool
`-ioFix {true | false}`	
	Fixes I/Os at current location. *Default*: false *Data_type*: bool
`-ioMoveWithEdge {true | false}`	
	Moves pins on the moved edge orthogonally to edge direction so pins stay on edge after movement. The pins on other edges are not touched. *Default*: false *Data_type*: bool
`-ioProportional {true | false}`	
	Resizes the space among I/Os proportionally. If you set this parameter to true, the I/Os are distributed proportional to the original I/O space. If you set this parameter to false, the I/Os are distributed evenly. **Note**: By default, the overlapping I/Os are spaced proportionally. *Default*: true *Data_type*: bool
`-maintainResourceRatioAfterResize {true | false}`	

	When enabled, it maintains the resource ratio after `resizeFloorplan` in shift-based mode. *Default*: false *Data_type*: bool
`-proportional {true | false}`	
	Resizes the space among floorplan objects proportionally. Default: false *Data_type*: bool
`-reset`	Restores all parameters modified using `setResizeFPlanMode` to their default settings. The `-reset` parameter must be the first parameter specified. If you specify -reset by itself, the software resets all `setResizeFPlanMode` parameters to their default values. If you specify parameters after `-reset`, the software resets only those parameters to their default values. Any values that do not already match the default value and are reset will be reported.
`-shiftBased {true | false}`	
	Shifts floorplan objects at appropriate location(s) without changing the proportional spacing. You can specify resize lines to control the areas of floorplan that will be expanded or shrunk. To set resize lines, use the `setResizeLine` command. If you do not specify resize line(s), the floorplan is resized automatically - that is, the resize lines are derived automatically based on the current floorplan and the specified resize values. *Default*: true *Data_type*: bool
`-shrinkFence {true | false}`	
	Enables resized lines to go through fences and regions in floorplan. With this option the `resizeFloorplan` command, automatically resizes fences, regions, and guides inside the floorplan while maintaining their minimum size after the shrink. Default: false *Data_type*: bool
`-snapToTrack {true | false}`	
	Snaps resize values (shrink/expand) of the floorplan to a multiple integer of the metal layer pitch. For example, if the horizontal metal pitch is 1.568 microns and you want to shrink the floorplan by 8 microns in y direction, the actual shrink value is 7.84 microns, the nearest multiple integer of the metal pitch. The x direction resize value snaps to the first vertical layer pitch and the y direction resize value snaps to the first horizontal layer pitch. *Default*: true *Data_type*: bool

Related Information

- `resizeFloorplan`
- `setResizeLine`
- `getResizeFPlanMode`
- Floorplanning the Design chapter in the *Innovus User Guide*
  - Resizing the Floorplan

setResizeLine

```
setResizeLine
[-help]
-clearAll
[-direction {H|V}]
[points]
[-width float]
```

Sets the resize lines for shift-based floorplan resize option of the `resizeFloorplan` command. The resize lines can be non-continuous though they must be orthogonal. If resize lines are specified, the floorplan will be resized between the area specified by the resize lines (for shift-based floorplan resize). To shrink or expand the floorplan in the horizontal direction, specify a vertical resize line. To shrink or expand the floorplan in the vertical direction, specify a horizontal resize line.

Each resize line can have multiple segments (for example, horizontal, vertical, and again horizontal) but it can only be applied to one direction. If you want to shrink or expand the floorplan in both directions, specify resize lines for each direction. You can create multiple resize lines. The resize lines are removed once the `resizeFloorplan` command is run. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setResizeLine` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setResizeLine`
`-clearAll`	Clears all resize lines. *Data_type*: bool, optional
`-direction {H|V}`	Specifies whether the resize line is horizontal (H) or vertical (V). *Data_type*: string, optional
points	Specifies the resize line point list. *Data_type*: pt list, optional
`-width` *float*	Specifies the width of the resize line in microns. A positive value expands the floorplan and a negative value shrinks the floorplan. *Data_type*: float, optional

Examples

- The following command sets a resize line with a width of 20 microns in the horizontal direction. As the width has a positive value, the floorplan will expand. The resize line is horizontal and will, therefore, expand the floorplan in a vertical direction.
  ```
  setResizeLine -direction H -width 20 (1924 3476) (3807 3476)
  ```
- The following command sets a resize line with a width of -20 microns in the horizontal direction. As the width has a negative value, the floorplan will shrink. The resize line is horizontal and will, therefore, shrink the floorplan in a vertical direction.
  ```
  setResizeLine -direction H -width -20 (1924 3476) (3807 3476)
  ```
- The following command sets a resize line with a width of 20 microns in the vertical direction. As the width has a positive value, the floorplan will expand. The resize line is vertical and will, therefore, expand the floorplan in a horizontal direction.
  ```
  setResizeLine -direction V -width 20 (2761 2215) (2761 3810)
  ```
- The following command sets a resize line with a width of -20 microns in the vertical direction. As the width has a negative value, the floorplan will shrink. The resize line is vertical and will, therefore, shrink the floorplan in a horizontal direction.
  ```
  setResizeLine -direction V -width -20 (2761 2215) (2761 3810)
  ```
- The following command sets a resize line with a width of -20 microns in the vertical direction. As a * has been specified for one of the coordinates, the value of that coordinate will be automatically derived.
  ```
  setResizeLine -direction V -width -20 (2761 *) (2761 3810)
  ```
- The following command creates a resize line with multiple segments.
  ```
  setResizeLine -direction V -width -20 (2643 1744) (2643 3411) (3382 3411) (3382 4117)
  ```

setRouteBlkDefaultLayer

```
setRouteBlkDefaultLayer
[-help]
{{[-layer layerName | {layerNameList} | all]
[-cutLayer layerName | {layerNameList} | all]
[-drcRegionLayer layerName | {layerNameList} | all]
[-trimMetalLayer layerName | {layerNameList} | all] } | {-allMetalCut }}
```

Specifies the default layers for routing blockages, for both metal layers and cut layers. The default layers set with this command are applicable for all routing blockages subsequently created using the GUI or the `createRouteBlk` command. Use this command before creating routing blockages.

Note: If any layers are specified with the `createRouteBlk` command, the layers specified with the `setRouteBlkDefaultLayer` command are ignored.

Parameters

`-allMetalCut`	Specifies that default routing blockages will be created for all metal layers and all cut layers. *Data_type*: bool, required
`-cutLayer layerName | {layerNameList} | all`	
	• *layerName*: Specifies that default routing blockages will be created for the specified cut layers. • `all`: Specifies that default routing blockages will be created for all cut layers. *Data_type*: list, optional
`-drcRegionLayer layerName | {layerNameList} | all`	
	• *layerName*: Specifies that default routing blockages will be created for the specified drc region layers. • `all`: Specifies that default routing blockages will be created for all drc region layers. *Data_type*: list, optional
`-help`	Outputs a brief description that includes the type and default information for each `setRouteBlkDefaultLayer` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setRouteBlkDefaultLayer`
`-layer layerName | {layerNameList} | all`	
	• *layerName*: Specifies that default routing blockages will be created for the specified metal layers. • `all`: Specifies that default routing blockages will be created for all metal layers. *Data_type*: list, optional
`-trimMetalLayer layerName | {layerNameList} | all`	
	• *layerName*: Specifies that default routing blockages will be created for the specified trim metal layers. • `all`: Specifies that default routing blockages will be created for all trim metal layers. *Data_type*: list, optional

Example

The following command sets default routing blockages for the metal layers1, 2, and 3 and the cut layers 3 and 5.

```
setRouteBlkDefaultLayer -layer 1 2 3 -cutLayer 3 5
```

setSelectedDensityArea

```
setSelectedDensityArea
[-help]
x1 y1 x2 y2
density
name
{Partial Soft Hard}
{Instance Pushdown Undefined}
```

Specifies the attributes for the selected density screen area(s). After importing the design and selecting the density area, if required, you can use this command to change the density area's location, type, or density.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setSelectedDensityArea` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setSelectedDensityArea`
x1 y1 x2 y2	
	Specifies the coordinates of the density screen area. *Data_type*: float, required
density	Specifies the standard cell placement density percentage. The valid values are in increments of 5: 0, 5, 10, ...100. For example, setting a density percentage of 75 percent means that up to 75 percent of the defined density area will be used for placement. **Note**: If you enter any number that is not valid, the percentage defaults to the nearest valid value. *Maximum:* 100 *Minimum:* 0 *Data_type*: float, required
name	Specifies the name of the density screen area. *Data_type*: string, required
`{Partial Soft Hard}`	
	Specifies the hardness of the density screen area. *Data_type*: enum, optional
`{Instance Pushdown Undefined}`	
	Specifies the relationship of the density screen area to the design. • `Instance`: The density screen area is associated with the current design. • `Pushdown`: The density screen area is pushed down from the hierarchy. • `Undefined`: The relationship of the density screen area to the design is undefined. *Default*: `Undefined`. *Data_type*: enum, optional

Example

The following command sets a soft density screen area, softDensity2, of the current design in the specified design area:

```
setSelectedDensityArea 100.0 100.0 200.0 200.0 75 softDensity2 Soft Instance
```

setSelectedObstruct

```
setSelectedObstruct
[-help]
x1 y1 x2 y2
ObstructName
{Instance Pushdown Undefined}
```

Sets the placement blockage attributes, like the area, name, and type, for the selected placement blockage (only). Use this command after importing the design and selecting the placement blockage.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setSelectedObstruct` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setSelectedObstruct`
`x1 y1 x2 y2`	Specifies the coordinates of the placement blockage area. *Data_type*: float, required
`ObstructName`	Specifies the name of the placement blockage. *Data_type*: string, required
{`Instance Pushdown Undefined`}	
	Specifies the type of placement blockage. • `Instance`: The placement blockage is associated with the current design. • `Pushdown`: The placement blockage is pushed down from the hierarchy. • `Undefined`: The type of placement blockage is undefined. *Default*: `Undefined` *Data_type*: enum, required

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

setSelectedRouteBlk

```
setSelectedRouteBlk
[-help]
llx lly urx ury
name
layers
[{Undefined | Fills | Slots | Pushdown | EXCEPTPGNET | PGNETONLY | ALLNET}]
[spacing]
```

Sets a routing blockage for an attribute of the selected routing blockage. Use this command after importing the design and selecting the routing blockage.

Parameters

`{Undefined | Fills | Slots | Pushdown | EXCEPTPGNET | PGNETONLY | ALLNET}`	
	Specifies the attribute of the routing blockage. This can be: • `Undefined` • `Fills` • `Slots` • `Pushdown` • `EXCEPTPGNET` • `PGNETONLY` • `ALLNET` *Default*: `Undefined` *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `setSelectedRouteBlk` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setSelectedRouteBlk`
`layers`	Specifies the layer(s) and/or via(s). • For layer names, specify the number. For example, 3 • For via names, specify the uppercase character V followed by the via number. For example, V3 **Note:** This parameter supports masterslice layers with type `REGION`. *Data_type*: string, required
`llx`	Specifies the lower left x coordinate of the bounding box. *Data_type*: float, required
`lly`	Specifies the lower left y coordinate of the bounding box. *Data_type*: float, required
`name`	Specifies the name of the routing blockage. *Data_type*: string, required
`urx`	Specifies the upper right x coordinate of the bounding box. *Data_type*: float, required
`ury`	Specifies the upper right y coordinate of the bounding box. *Data_type*: float, required
`spacing`	Specifies the minimum spacing between layers within the routing blockage. The value is a real number greater than or equal to 0. *Data_type*: string, optional

Examples

- The following command sets the routing blockage for fills in routing blockage blk2 that lies in the bounding box with the coordinates 17, 223, 1117, and 1223, on metal layer1 and via 2.

```
setSelectedRouteBlk 17 223 1117 1223 blk2 {1 V2} Fills
```

setSelectedStripBoxShape

```
setSelectedStripBoxShape
[-help]
index
{None RING STRIPE FOLLOWPIN IOWIRE COREWIRE BLOCKWIRE FILLWIRE PADRING DRCFILL FILLWIREOPC}
```

Sets the shape of the selected strip box. You can use this command after importing the design and selecting a stripe box (special routing).

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setSelectedStripBoxShape` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setSelectedStripBoxShape`
index	Specifies which selected strip box shape needs to be set. You can specify one of the following: • `all`: Specifies that the shape of all the selected strip boxes must be set. • `integer`: Specifies that the shape of only the selected strip box must be set. For example, if you have 4 strip boxes selected, an index value, 2, specifies that the shape of the third selected strip box must be set. *Data_type*: string, required
`{None RING STRIPE FOLLOWPIN IOWIRE COREWIRE BLOCKWIRE FILLWIRE PADRING DRCFILL FILLWIREOPC}`	
	Specifies the shape of the selected strip box. You can specify one of the following values: • `None` • `RING` • `STRIPE` • `FOLLOWPIN` • `IOWIRE` • `COREWIRE` • `BLOCKWIRE` • `FILLWIRE` • `PADRING` • `DRCFILL` • `FILLWIREOPC` *Data_type*: enum, required

Examples

- If you selected 5 strip boxes, the following command sets the shape of the fifth strip box to RING.
  ```
  setSelectedStripBoxShape 4 RING
  ```
- If you selected 4 strip boxes, the following command sets the shape of all the 4 strip boxes to RING.
  ```
  setSelectedStripBoxShape all RING
  ```

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

setSelectedStripBoxState

```
setSelectedStripBoxState
[-help]
index
{ROUTED FIXED COVER SHIELD}
[shield_net]
```

Sets the state of the selected strip box. You can use this command after importing the design and selecting a stripe box.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `setSelectedStripBoxState` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setSelectedStripBoxState`
index	Specifies which selected strip box state needs to be set.You can specify one of the following: • `all`: Specifies that the state of all the selected strip boxes must be set. • `integer`: Specifies that the state of only the selected strip box must be set.For example, if you have 4 strip boxes selected, an index value, 2, specifies that the state of the third selected strip box must be set. *Data_type*: string, required
`{ROUTED FIXED COVER SHIELD}`	
	Specifies the state of the selected strip box. You can specify one of the following values: • `ROUTED` • `FIXED` • `COVER` • `SHIELD` *Data_type*: enum, required
shield_net	Specifies the shield net. If you are setting the state of the selected strip box as SHIELD, you must specify a shield net. *Data_type*: string, optional

Examples

- If you selected 5 strip boxes, the following command sets the state of the fifth strip box to FIXED.
  ```
  setSelectedStripBoxState 4 FIXED
  ```
- If you selected 4 strip boxes, the following command sets the state of all the 4 strip boxes to ROUTER.
  ```
  setSelectedStripBoxState all ROUTED
  ```

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

shiftOrigin

```
shiftOrigin
[-help]
{-center | -lowerLeft | -location x y | -delta x y}
```

Shifts the entire design to a new location. All objects that are recorded in DEF are shifted to a new location. No change is made to the other attributes of objects except the location. All properties and characters such as orientation and placement status remain the same after the shift.

Parameters

`-center`	Shifts the origin point of the entire design to the center point of the current floorplan box. Example: `shiftOrigin -center` Before:  After:  *Data_type*: bool, optional

`-delta x y`	Shifts the origin point of the entire design by the specified distance, *deltaX* and *deltaY* Example: `shiftOrigin -delta 500 500` Before:  After:  *Data_type*: point, optional
`-help`	Outputs a brief description that includes the type and default information for each `shiftOrigin` parameter. For a detailed description of the command and all of its parameters, use the man command: `man shiftOrigin`

`-location x y`	Shifts the origin point of the entire design to the specified location, `x y`. Example: `shiftOrigin -location 300 300` Before:  After:  *Data_type*: point, optional

`-lowerLeft`	Shifts the origin point of the entire design to the lower left point of current floorplan box. Example: `shiftOrigin -lowerLeft` Before:  After:  *Data_type*: bool, optional

Example

The following command moves the origin point to the center point of the current floorplan box:

```
shiftOrigin -center
```

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

snapFPlan

```
snapFPlan
[-help]
{{-all} | {-selected} |
{[-guide][-block][-stdCell][-ioPad][-areaIo][-ptnCore][-pinGuide][-routeBlk][-placeBlk][-macroPin][-pin][-pinBlk]}}
```

Snaps floorplan objects to the grid. You can use this command after importing the design.

Note: Innovus honors the FinFET grid and automatically checks for the FinFET definition. If it detects a FinFET definition, it enables support and sets the placement grid as FinFET grid by default. Since the height of all placeable objects must be a multiple of FinFET grid and the origin of these objects must be snapped to the FinFET grid. The snapFPlan command is used to snap blocks, I/O pads, standard cells to the FinFET grid. It honors user specified snapping rule for x direction. For y direction, it honors the FinFET grid (when the FinFET grid is horizontal in regular horizontal row design).

Parameters

`-all`	Specifies the snapping of all supported object types. *Data_type*: bool, required
`-areaIo`	Specifies the snapping of I/O cells. *Data_type*: bool, optional
`-block`	Specifies the snapping of floorplan blocks. *Data_type*: bool, optional
`-guide`	Specifies the snapping of floorplan guides, regions, and fences. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `snapFPlan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man snapFPlan`
`-ioPad`	Specifies the snapping of I/O pads. *Data_type*: bool, optional
`-macroPin`	Specifies the snapping of macro pins to the correct color track. **Note:** The `snapFPlan` command only snaps signal pins and places a macro with macro pins on color track. Innovus snaps the port on the lowest metal layer which is close to macro origin to the color track. *Data_type*: bool, optional
`-pin`	Specifies the snapping of pins. *Data_type*: bool, optional
`-pinBlk`	Specifies the snapping of pin blockages. *Data_type*: bool, optional
`-pinGuide`	Specifies the snapping of pin guides. *Data_type*: bool, optional
`-placeBlk`	Specifies the snapping of placement blockages. *Data_type*: bool, optional
`-ptnCore`	Specifies the snapping of the partition core. *Data_type*: bool, optional
`-routeBlk`	Specifies the snapping of routing blockages. *Data_type*: bool, optional
`-selected`	Specifies the snapping of all supported object types that are selected in the design display area. *Data_type*: bool, required
`-stdCell`	Specifies the snapping of standard cells. *Data_type*: bool, optional

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

snapFPlanIO

```
snapFPlanIO
[-help]
[-selected]
[-userGrid | -toIoRow [-overlapRowOnly]]
```

Snaps I/O cells to a user-defined grid. Use this command after importing the design.

Note: You can specify the user-defined grid in the *Preferences - Floorplan* form in the View Menu of the Innovus GUI.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `snapFPlanIO` parameter. For a detailed description of the command and all of its parameters, use the man command: `man snapFPlanIO`
`-overlapRowOnly`	Snaps the I/O cell only onto an overlapping I/O row. If an I/O row is not found, the command is not executed. *Data_type*: bool, optional
`-selected`	Applies to the selected I/Os only. *Default*: snaps to all I/O cells. *Data_type*: bool, optional
`-toIoRow`	Snaps the I/O cell onto an overlapping I/O row first. If an I/O row is not found, places the I/O cell in any row having the same site. *Data_type*: bool, optional
`-userGrid`	Specifies the snapping of I/O pads to user-defined grids. *Default*: snaps I/O to manufacture grid. *Data_type*: bool, optional

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

spaceIoInst

```
spaceIoInst
[-help]
[-fixSide {left | right | top | bottom | horDistribute | vertDistribute}]
[-space value]
```

Spaces the selected I/O cells horizontally or vertically by a specified distance value, and can evenly distribute the spacing horizontally or vertically between two or more I/O cells. You can use this command after selecting two or more instances in the design display area.

Note: This command supports I/O row flow.

Parameters

`-fixSide`	Specifies the vertical and horizontal instance spacing. Choose one of the following: • `left`: Specifies horizontal left spacing. • `right`: Specifies horizontal right spacing. • `top`: Specifies vertical top spacing. • `bottom`: Specifies vertical bottom spacing. • `horDistribute`: Specifies an even horizontal distribution. • `vertDistribute`: Specifies an even vertical distribution. *Default:* The default value is `left`. *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `snapIoInst` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man snapIoInst`
`-space value`	Specifies the spacing value, in micrometers. *Default:* The default value is 0 *Data_type*: float, optional

Example

The following command aligns the right-most highlighted I/O cell horizontally with a spacing of 5 micrometers:

```
spaceIoInst -fixSide right -space 5
```

Related Information

- `spaceObject`
- Floorplanning the Design chapter in the *Innovus User Guide*
  - Performing I/O Row Based Pad Placement

spaceObject

```
 spaceObject
[-help]
-fixSide {left | right | center | top | bottom | middle | distHorizontal | distVertical}
[-honorHalo]
[-space value [-isSpaceMeanLLtoLL ] ]
```

Spaces objects (instances, modules, or blockages) horizontally or vertically by a specified distance value, and can evenly distribute the spacing horizontally or vertically between three or more objects. You can use this command after selecting two or more objects in the design display area.

Note: To space I/O cells, use the `spaceIoInst` command.

Parameters

`-fixSide`	Specifies the vertical and horizontal object spacing. Choose one of the following: • `left`: Specifies that the left most object is fixed and all other objects are shifted horizontally to the right side of the fixed object, maintaining space defined in the `-space` option. • `right`: Specifies that the right most object is fixed and all other objects are shifted horizontally to the left side of the fixed object, maintaining space defined in the `-space` option. • `center`: Maintains the center point of the selected objects. It calculates the mid-point between the left most edge and right most edge of the selected objects and then spaces the blocks at the specified distance and centers them around this mid-point so that the left most edge and right most edge are at an equal distance from the mid-point. • `top`: Specifies that the top most object is fixed and all other objects are shifted vertically to the down side of the fixed object, maintaining space defined in the `-space` option. • `bottom`: Specifies that the bottom most object is fixed and all other objects are shifted vertically to the up side of the fixed object, maintaining space defined in the `-space` option. • `middle`: Maintains the center point of the selected objects. It calculates the mid-point between the top most edge and bottom most edge of the selected objects and then spaces the blocks at the specified distance and centers them around this mid-point so that the top most edge and bottom most edge are at an equal distance from the mid-point. • `distHorizontal`: Specifies an even horizontal distribution. • `distVertical`: Specifies an even vertical distribution. *Data_type*: enum, required
`-help`	Outputs a brief description that includes the type and default information for each `spaceObject` parameter. For a detailed description of the command and all of its parameters, use the man command: `man spaceObject`
`-honorHalo`	Honors placement halo. With this option on, selected objects are spaced by a given value measured from the edge of the halo and not from the edge of the object. *Data_type*: bool, optional
`-isSpaceMeanLLtoLL`	When specified it signifies that the spacing value denotes the distance from the Object A's lower left to Object B's lower left. By default, this parameter is false. This implies that the spacing value signifies the distance between the bounding of Object A and Object B. *Data_type*: bool, optional
`-space value`	Specifies the spacing value, in micrometers. *Data_type*: float, optional

Example

The following command fixes the bottom-most highlighted object and moves all the other objects vertically to the top, spacing the objects 5 micrometers apart from each other:

```
spaceObject -fixSide bottom -space 5
```

Related Information

- `spaceIoInst`
- Floorplanning the Design chapter in the *Innovus User Guide*

specifyNetWeight

```
specifyNetWeight
[-help]
netName ... netWeightValue
```

Specifies the priority weighting of a net. You can use this command after importing the design.

Note: Partition pin assignment honors `specifyNetWeight`. Pins that connect to a net that has a higher net weight are assigned before the pins that connect to a net with a lower net weight.

Note: The `setPlaceMode -place_global_clock_gate_aware` option has higher priority over `specifyNetWeight` and hence, if it is set then tool will not honor the weights on the clock net during the placement run as specified using the `specifyNetWeight` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `specifyNetWeight` parameter. For a detailed description of the command and all of its parameters, use the man command: `man specifyNetWeight`
`netName..`	Specifies the name(s) of an individual net. You can use wildcards (*?) with this parameter. *Data_type*: string, required
`netWeightValue`	Specifies the weighting priority of the net name, with values 512 (highest) through 1 (lowest), or 0 (don't care). *Default*: If you do not specify this parameter, the weight for nets is 2. The placer will try to shorten nets with higher weight, and give less priority to lower weights (ignoring nets with weight 0). The placer has a limit of 10 for the highest weight, and will treat any value above 10 as 10. The router will route higher weighted nets before lower weighted nets. *Data_type*: string, required

Examples

- The following commands set the priority net weighting for nets STRW to first, WE2N to second, and IOWIN to third:

  ```
  specifyNetWeight WE2N 9
  specifyNetWeight STRW 10
  specifyNetWeight IOWIN 8
  ```

- `specifyNetWeight` does not accept a Tcl list. You can list multiple nets by omitting the curly brackets:

  ```
  specifyNetWeight n1 n2 10
  specifyNetWeight n5 scan* 1
  ```

  You can also surround it with a foreach loop:

  ```
  foreach net [dbGet top.nets.name n*] {specifyNetWeight $net 10}
  ```

Related Information

stretchRows

```
stretchRows
[-help]
{-left | -right | -left -right}
[-toCoreEdge]
```

Stretches selected rows. You can use this command after importing a design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `stretchRows` parameter. For a detailed description of the command and all of its parameters, use the man command: `man stretchRows`
`-left`	Specifies that the left edge of all selected rows should be aligned to the left-most edge among all selected rows. *Data_type*: bool, optional
`-right`	Specifies that the right edge of all selected rows should be aligned to the right-most edge among all selected rows. *Data_type*: bool, optional
`-toCoreEdge`	Specifies that row edges should be aligned to the core boundary. *Data_type*: bool, optional

Example

The following command specifies that the left edge of all selected rows should be aligned to the left-most edge among all selected rows.

```
stretchRows -left
```

Related Information

- `deleteRow`
- `cutRow`

swapPins

```
swapPins
[-help]
```

Switches the locations of two pins. You can use this command after selecting two pins in the same module in the design display area.

Parameters

`-help`	Outputs a brief description of the `swapPins` command. For a detailed description of the command, use the man command: `man swapPins`

Example

- The following commands show the method to swap two pins in command line:

  ```
  deselectAll
  selectPin pin1
  selectPin pin2
  swapPins
  ```

Related Information

trace_obj_connectivity

```
trace_obj_connectivity
[-help]
[-clear_trace]
[-level level]
[-mode {netlist_based timing_based}]
[-out_file file_name]
[-insts string] | [-ports string] | [-selected ] | [-in_files file_name]
```

Traces the connections of specified macros, selected macros, or specified ports. You can also trace the connections based on netlist or timing. It supports different levels. You can also set global parameters for the `trace_obj_connectivity` by using the `set_trace_obj_connectivity_mode` command. Parameters that you specify with `set_trace_obj_connectivity_mode` are then used automatically whenever you run the `trace_obj_connectivity` command or use the *Trace Macro* form. You can use this command after `proto_design`, `place_design`, or even after the whole design is completed.

Parameters

`-clear_trace`	Clears the existing trace result. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `trace_obj_connectivity` parameter. For a detailed description of the command and all of its parameters, use the man command: `man trace_obj_connectivity`
`-in_files file_name`	Specifies the name of the file from which saved trace macro results are loaded. *Data_type*: string, optional
`-insts string`	Specifies the macros to be traced. *Data_type*: string, optional
`-level level`	Specifies the trace level. *Maximum Level*: 10 *Minimum Level*: 1 *Default*: 1 *Data_type*: int, optional
`-mode {netlist_based timing_based}`	
	Specifies the trace mode to use: • `netlist_based`: Specifies that connection of the macro will be traced based on the netlist. • `timing_based`: Specifies that connection of the macro will be traced based on advanced timing tcl scripts command `all_fanin` and `all_fanout`. *Data_type*: enum, optional
`-out_file file_name`	Specifies the name of the file in which the trace macro results are saved. *Default*: `<top_module_name>.tmcdb` *Data_type*: string, optional
`-ports string`	Specifies the names of the ports to be traced. *Data_type*: string, optional
`-selected`	Traces the selected macros or ports. *Data_type*: bool, optional

Example

The following command traces the connections for blk1 upto level 3:

```
trace_obj_connectivity -insts blk1 -level 3
```

unfixAllIos

```
unfixAllIos
[-help]
[-incAreaIo]
```

Changes the status of all I/Os from `FIXED` to `PLACED`. If any I/O has a status other than fixed prior to running this command, that status will be retained. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `unfixAllIos` parameter. For a detailed description of the command and all of its parameters, use the man command: `man unfixAllIos`
`-incAreaIo`	Changes the status of all `CLASS PAD AREAIO` cells from a `FIXED` state to a `PLACED` state. *Data_type*: bool, optional

Examples

- The following command changes the status of all I/O pins and I/O cells from a `FIXED` state to a `PLACED` state:
  ```
  unfixAllIos
  ```
- The following command changes the status of all I/O pins, I/O cells, and all `CLASS PAD AREAIO` cells from a `FIXED` state to a `PLACED` state:
  ```
  unfixAllIos -incAreaIo
  ```

Related Information

- `fixAllIos`
- Floorplanning the Design chapter in the *Innovus User Guide*
- Data Preparation chapter in the *Innovus User Guide*
  - Performing Area I/O Placement

unplaceAllBlocks

```
unplaceAllBlocks
[-help]
```

Unplaces all blocks in the floorplan. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description of the `unplaceAllBlocks` command. For a detailed description of the command, use the man command: `man unplaceAllBlocks`

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

unplaceAllGuides

```
unplaceAllGuides
[-help]
```

Clears all constraints (guides, regions, and fences) from the floorplan. You can use this command after importing the design.

Note: The `unplaceAllGuides` command does not delete instGroups.

Parameters

`-help`	Outputs a brief description of the `unplaceAllGuides` command. For a detailed description of the command, use the man command: `man unplaceAllGuides`

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

unplaceAllInsts

```
unplaceAllInsts
[-help]
```

Unplaces all instances from the floorplan including blobs and std cells whose status is PLACED. It changes the status from PLACED to UNPLACED. You can use this command after importing the design.

Note: The `unplaceAllInsts` command does not deal with the std. cells whose status is FIXED, SOFTFIXED, or COVER.

Parameters

`-help`	Outputs a brief description of the `unplaceAllInsts` command. For a detailed description of the command, use the man command: `man unplaceAllInsts`

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

unplaceGuide

```
   unplaceGuide
[-help]
obj_name
```

Unplaces hierarchical instances and instance groups from the floorplan. This command can also be used to delete fences and regions. Guides are hierarchical instances in the design and are guided in the floorplan. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `unplaceGuide` parameter. For a detailed description of the command and all of its parameters, use the man command: `man unplaceGuide`
`obj_name`	Specifies the name of the module or group to be guided. *Data_type*: string, required

Examples

- The following command unplaces the guide MEM_DSCAN from the floorplan:
  ```
  unplaceGuide MEM_DSCAN
  ```
- The following command unplaces the instance group adder1 from the floorplan:
  ```
  unplaceGuide adder1
  ```

Related Information

- `createFence`
- `createRegion`
- Floorplanning the Design chapter in the *Innovus User Guide*

unplaceGuideConstraints

```
unplaceGuideConstraints
[-help]
```

Clears only the guide constraints from the floorplan. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description of the `unplaceGuideConstraints` command. For a detailed description of the command, use the man command: `man unplaceGuideConstraints`

Related Information

- Floorplanning the Design chapter in the *Innovus User Guide*

unsetFixedBlockSize

```
  unsetFixedBlockSize
[-help]
name_list
```

Specifies that during floorplan resizing, the size of the specified modules and/or blackboxes can change. Use this command to unset the fixed block size specified with the `setFixedBlockSize` command. You would use this command after setting the block size of modules and/or black boxes to fixed with the `setFixedBlockSize` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `unsetFixedBloxkSize` parameter. For a detailed description of the command and all of its parameters, use the man command: `man unsetFixedBlockSize`
`name_list`	Specifies that the size of the specified modules and/or blackboxes can change during floorplan resizing. Provide a space-separated list of instances. `*`: Specifies that the size of all the modules and/or blackboxes can change during floorplan resizing. *Data_type*: list, required

Example

The following command specifies that the size of instanceA and instanceB can change during floorplan resizing.

```
unsetFixedBlockSize instanceA instanceB
```

Related Information

- `setFixedBlockSize`
- Floorplanning the Design chapter in the *Innovus User Guide*

update_floorplan_for_macro_place

```
update_floorplan_for_macro_place
[-help]
[-init_rows]
[-keep_fixed_insts {inst1 inst2 ...}]
[-remove {all route_blockage place_blockage relative_floorplan power_domain insts_place wire boundary_constraint physical_inst drc PG_pin}]
```

Enables you to update the floorplan before defining constraints for macros with the `set_macro_place_constraint` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `update_floorplan_for_macro_place` parameter. For a detailed description of the command and all of its parameters, use the man command: `man update_floorplan_for_macro_place`
`-init_rows`	Creates core rows. *Data_type*: bool, optional
`-keep_fixed_insts {inst1 inst2 ...}`	
	Keeps the specified instances in the floorplan. It sets the instances which are not unplaced. *Data_type*: string, optional
`-remove {all route_blockage place_blockage relative_floorplan power_domain insts_place wire boundary_constraint physical_inst drc PG_pin}`	
	Removes the specified objects from the floorplan. *Data_type*: enum_list, optional

Example

- The following command initializes the core rows and deletes the placement blockages from the floorplan:

  ```
  update_floorplan_for_macro_place -init_rows -remove place_blockage
  ```

Related Information

- `create_pg_model_for_macro_place`

write_macro_place_constraint

```
write_macro_place_constraint
[-help]
[-cpg_scope {selected macro_only all}]
-out_file string
[-sections {array basic cpg pg_model_over_macros pg_resource_model}]
```

Enables you to write constraints into a TCL format file from the database.

Parameters

`-cpg_scope {selected macro_only all}`	
	Specifies the instances that are to be written in the CPG guide section. *Data_type*: enum, optional
`-help`	Outputs a brief description that includes the type and default information for each `write_macro_place_constraint` parameter. For a detailed description of the command and all of its parameters, use the man command: `man` write_macro_place_constraint
`-out_file string`	Specifies the name of the file to which the macro place constraints are written. *Data_type*: string, optional
`-sections {array basic cpg pg_model_over_macros pg_resource_model net_length net_resistance}`	
	Specifies the constraint sections to be written. • `array`: Writes macro array constraints. • `basic`: Writes non-default macro place constraints set by the `set_macro_place_constraint` command. • `cpg`: Writes out the guide file for initializing the orientation of the instances and placing them close to the specified location. • `pg_model_over_macros`: Writes PG modeling for macros. • `pg_resource_model`: Writes PG resource modeling for standard cell areas. **Note**: This option is used to model PG over the whole design if the `-pg_model_over_macros` option is not specified. **Note:** Only the basic constraints are dumped out if the -sections option is not specified. *Data_type*: enum_list, optional

Example

- The following command writes the basic macro place constraints to the xyz file:
  ```
  write_macro_place_constraint -cpg_score all -out_file xyz
  ```

Related Information

- `check_macro_place_constraint`
- `create_pg_model_for_macro_place`
- `get_macro_place_constraint`

writeFPlanScript

```
writeFPlanScript
[-help]
[-appendToFile]
[-compactRow]
-fileName fileName
[-no_snap_to_grid]
[-selected | -sections {boundary row placeBlockages routeBlockages pinBlockages groups constraints pins ioPad areaIO bump partitions blocks
globalNetConnect busSinkGroups blackboxes netGroupAndBusGuide relativefplan pinGroups pinGuides customShape coverCell}]
```

Allows you to write out the specified floorplan sections and source the output file after init_design. With this command the tool would write a file that you can examine, edit, and then source to selectively (or completely) define your floorplan. You can specify the floorplan section to write out. The `writeFPlanScript` command writes out a file with Tcl commands to recreate the floorplan. It can optionally write out specific floorplan sections listed with option -sections. The file includes commands to delete any existing data for each section if any exists.

Note: Unlike `saveFPlan`, the `writeFPlanScript` command does not include special-routing like P/G routing. You should use `defOutBySection -specialNetRouting` for that purpose.

Note: The `createBusGuide -type {hard | soft}` command supports soft/hard constraints to guide Innovus routers. With the hard constraint type, after running Early Global Route (eGR), NanoRoute (NR), or NanoRoute High Frequency Router (NRHF), the route obeys the path of the bus guide but with soft constraints the bus guide only guides the route path. The tool can route the net out of the bus guide. The `writeFPlanScript` command writes out these constraints types to the output file.

Parameters

`-appendToFile`	Appends new data to the file, by default it will write out to the file specified by `-fileName`. *Data_type*: bool, optional
`-compactRow`	When specified, it enables the `writeFPlanScript` command to write out the row-creation commands in a simple and compact way. *Data_type*: bool, optional
`-fileName` *fileName*	Writes the floorplan Tcl commands to the specified file. *Data_type*: string, required
`-help`	Outputs a brief description that includes the type and default information for each `writeFPlanScript` parameter. For a detailed description of the command and all of its parameters, use the man command: `man writeFPlanScript`
`-no_snap_to_grid`	Specifies that the object should not be snapped to the specified grid and keep the location of object the same before and after loading the dumped script. *Data_type*: bool, optional
`-sections {boundary row placeBlockages routeBlockages pinBlockages groups constraints pins ioPad areaIO bump partitions blocks globalNetConnect busSinkGroups blackboxes netGroupAndBusGuide relativefplan pinGroups pinGuides customShape coverCell}`	

	Specifies one or more specific floorplan sections to write out to the file. • `areaIO`: Writes out areaIO information. • `blackboxes`: Writes out location, shape, and orientation of black box instances. • `blocks`: Writes out placement and orientation of all blocks. • `boundary`: Writes out the floorplan boundary, including the boundary to IO and core box spacing, and the global row parameters required by the `floorPlan` command to regenerate the rows automatically. **Note**: The `floorPlan` command will auto-generate the rows also, unless "rows" is included with `-sections` to override them with the current rows. • `bump`: Writes out all the bumps. • `busSinkGroups`: Writes bus sink group information. • `constraints`: Writes out any region, fence, and guide constraints for groups or hinsts. • `coverCell`: Writes out cover cell information. • `customShape`: Writes out custom shape information. • `globalNetConnect`: Writes out all the global net connections. • `groups`: Writes out any group definitions (group names and list of instances). It also writes out the groups belonging to power domains. • `ioPad`: Writes out all the IO pads. • `netGroupAndBusGuide`: Writes out all the net groups and bus guides. • `partitions`: Writes out all the partitions. • `pinBlockages`: Writes out all pin blockages. • `pinGroups`: Writes out all the pin groups. • `pinGuides`: Writes out all the pin guides. • `pins`: Writes out all the external IO pins. • `placeBlockages`: Writes out placement/density blockages. • `relativefplan`: Writes out relative floorplan constraints and all the placement relationship of floorplan objects independently from the actual coordinates in a floorplan. **Note**: You can use `writeFPlanScript -sections relativefplan` to save relative floorplan info. • `routeBlockages`: Writes out routing blockages. • `row`: Writes out all the core and IO rows. *Data_type*: enum_list, optional
`-selected`	Specifies the floorplan object to write out. **Note:** The tool does not support to write out standard cells. *Data_type*: bool, optional

Example

- The following command writes out the user specified (row) section to the `writeFPlanScript.tcl` file.

  ```
  writeFPlanScript -sections {row} -fileName writeFPlanScript.tcl
  ```

  In writeFPlanScript.tcl, something like the following will be written out:

  ```
  # Standard Cell Row
  deleteRow -all
  set rdagFPlanRowSpaceType 2
  set rdagFPlanRowSpacing 0
  createRow -site tsm3site -area 335.280 335.440 1176.780 340.480 -flip1st -noCheck
  createRow -site tsm3site -area 335.280 340.480 1176.780 345.520 -noCheck
  createRow -site tsm3site -area 335.280 345.520 1176.780 350.560 -flip1st -noCheck
  createRow -site tsm3site -area 335.280 350.560 1176.780 355.600 -noCheck
  createRow -site tsm3site -area 335.280 355.600 1176.780 360.640 -flip1st -noCheck
  createRow -site tsm3site -area 335.280 360.640 1176.780 365.680 -noCheck
  ```

```
...
createRow -site tsm3site -area 335.280 1172.080 1176.780 1177.120 -flip1st -noCheck
fpSetDefaultTechSite -site tsm3site
```

- The following command by default writes out all the sections to the `writeFPlanScript.tcl` file

  ```
  writeFPlanScript -fileName writeFPlanScript.tcl
  ```

  In `writeFPlanScript.tcl`, something like the following will be written out:

  ```
  # floorplan boundary
  set ret [catch {floorplan -noResize -noSnapToGrid -b 0.000 0.000 1511.960 1512.120 235.000 235.000 1276.960 1277.120 335.280 335.440
  1176.960 1177.120 }]
  if {$ret != 0} {
  floorplan -noSnapToGrid -b 0.000 0.000 1511.960 1512.120 235.000 235.000 1276.960 1277.120 335.280 335.440 1176.960 1177.120
  }
  # Standard Cell Row
  deleteRow -all
  set rdagFPlanRowSpaceType 2
  set rdagFPlanRowSpacing 0
  createRow -site tsm3site -area 335.280 335.440 1176.780 340.480 -flip1st -noCheck
  createRow -site tsm3site -area 335.280 340.480 1176.780 345.520 -noCheck
  ...
  fpSetDefaultTechSite -site tsm3site
  # Placement obstruction
  deletePlaceBlockage -all
  # Routing obstruction
  deleteRouteBlk -all
  # Pin blockage
  deletePinBlkg -all
  # Instance group
  # Hierarchical Instance's constraint(Fence, Region or Guide)
  # Pin
  setPinAssignMode -pinEditInBatch true
  setPinAssignMode -pinEditInBatch false
  # IO pad
  dbPlaceInst [dbGetInstByName IOPADS_INST/Pibiasip] [uu2dbu 0.000] [uu2dbu 548.160] R270
  setInstancePlacementStatus -status fixed -name IOPADS_INST/Pibiasip
  ...
  # Area IO
  # Bump
  deleteBumps -all
  # Block placement
  unplaceAllBlocks
  deleteHaloFromBlock -allBlock
  placeInstance DTMF_INST/PLLCLK_INST 355.280 355.440 R0
  addHaloToBlock 20 20 20 20 DTMF_INST/PLLCLK_INST
  setInstancePlacementStatus -status fixed -name DTMF_INST/PLLCLK_INST
  ...
  # Global Net Connection
  clearGlobalNets
  globalNetConnect VDD -pin VDD -instanceBasename * -type pgpin -all
  globalNetConnect VSS -pin VSS -instanceBasename * -type pgpin -all
  ...
  applyGlobalNets
  # partition
  # netGroupAndBusGuide
  # relative floorplan
  ```

- The following command writes out the user specified (customShape) section to the `writeFPlanScript.tcl` file

  ```
  writeFPlanScript -sections {customShape} -fileName writeFPlanScript.tcl
  ```

  In `writeFPlanScript.tcl`, something like the following will be written out:

  ```
  # custom shapes
  delete_gui_object -shape
  add_gui_shape -layer <layer>  -line {x1 y1 x2 y2}
  add_gui_shape -layer <layer>  -polygon {x1 y1 x2 y2 …}
  ```

add_interposer_route_block

```
add_interposer_route_block
[-help]
-cell cell_name
-inst clone_name
-location {x y}
-orient {R0 R90 R180 R270 MX MY MX90 MY90}
```

Adds the clone blocks. It transforms the similar unrouted areas to a clone partition, which repeats the same routing pattern as the routed master block. This command enables you to replicate the routed master block multiple times with different orientations.

Note: Before using the `add_interposer_route_block` command, you must launch another Innovus session for loading the initial DB followed by using `create_interposer_route_block` command to create the routed master block partition by specified box. This is used to generate master block partition and top DB.

Parameters

`-cell cell_name`	Specifies the master cell name that needs to be repeated (string, required) *Data_type*: string, required
`-help`	Outputs a brief description that includes the type and default information for each `add_interposer_route_block` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_interposer_route_block`
`-inst clone_name`	Specifies the clone block name. *Data_type*: string, required
`-location {x y}`	Specifies the clone block's origin location. **Note:** The relative location between clone block's origin and the terms should exactly be the same with the master. Otherwise, the wire of clone blocks will be shift accordingly after assemble design. **Note:** The snapping grid of the created block honors the `setFPlanMode -snapBlockGrid` command settings. *Data_type*: point, required
`-orient {R0 R90 R180 R270 MX MY MX90 MY90}`	
	Specifies the orientation of the clone block compared with the master. *Data_type*: enum, required

Examples

- The following command replicates the routing pattern of the master cell (`master_block`) to the clone block (`clone_block_1`) at location x1 y1 at orientation R0.
  ```
  add_interposer_route_block -cell master_block -inst clone_block_1 -location {x1 y1} -orient R0
  ```
- The following command repeats replicating the routing pattern of the master cell (`master_block`) to the clone block (`clone_block_2`) at location x2 y2 at orientation R180.
  ```
  add_interposer_route_block -cell master_block -inst clone_block_2 -location {x2 y2} -orient R180
  ```

Related Information

create_interposer_route_block

```
create_interposer_route_block
[-help]
-box {x1 y1 x2 y2}
-cell cell_name
-dir dir_name
-inst master_name
```

Creates the master block. It transforms the routed domain to a master partition block that enrolls all the special routes.

Note: If the design does not have a routing pattern that can be treated as a master block, the functionality of the `create_interposer_route_block` command can be replaced by loading the LEF file of the master partition that has the same routing pattern using the `loadLefFile` command. After this, the `add_interposer_route_block` command can be used directly.

Parameters

`-box {x1 y1 x2 y2}`	Specifies the master block's bounding box. **Note**: The snapping grid of the created block honors the `setFPlanMode -snapBlockGrid` command settings. *Data_type*: box, required
`-cell cell_name`	Specifies the master cell name. *Data_type*: string, required
`-dir dir_name`	Specifies the directory name that will contain the partition information and files. The tool creates the directory and saves the information and files for the top and master block partition automatically after the `create_interposer_route_block` command is used. *Data_type*: string, required
`-help`	Outputs a brief description that includes the type and default information for each `create_interposer_route_block` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_interposer_route_block`
`-inst master_name`	Specifies the master block name. **Note:** The default orientation of the created master block is R0. *Data_type*: string, required

Examples

- The following command transforms the routed domain to a master partition block.
  ```
  create_interposer_route_block -cell cell_name -inst master_block -box {llx lly urx ury} -dir PTN
  ```

alias

```
alias
[-help]
new_cmd
old_cmd
[-args {{new old} ...}]
```

Create command aliases for any Tcl command. It is a wrapper around the built-in Tcl “interp alias” command. All command aliases are public, so partial command matching and using <tab> to complete a typed in command work on them. It also supports argument name aliases for procs that use `define_proc_arguments` and `parse_proc_arguments` for parsing the arguments, and for application commands. The argument aliases do not work for built-in Tcl commands. The argument aliases are private, so they are not shown by `-help`, and do not support partial-option completion or matching.

You can use this command to migrate an existing Tcl script when some of the commands or argument names have changed, but are otherwise compatible.

Parameters

`-help`	Prints a brief description that includes type and default information for each `bindkey` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man bindkey`
`new_cmd`	Specifies the new command name that is an alias for the existing *`old_cmd`* name. It can be the same name as the *`old_cmd`* if you only want to create new `-arg` aliases, and do not need a new command alias. *Data_type*: string, required
`old_cmd`	Specifies the existing old command name. *Data_type*: string, required
`-args {{`*`new old`*`} …}`	Specifies a list of new and old argument names to create aliases. You can give multiple *`new`* names for the same *`old`* name. The new aliases are private, and do not show up with `-help`. You can create more than one alias for the same *`old`* name. *Data_type*: string, optional

Example

The following command adds a new command name alias `new_read_sdf` and some arg name aliases for `read_sdf`:

```
>alias new_read_sdf read_sdf -args {
  {-ignore_error -continue_on_error}
  {-summary -report_summary}
  {-sum -report_summary}
}
```

Then, the following commands

```
>new_read_sdf in.sdf -ignore_error -summary
>new_read_sdf in.sdf -ignore_error -sum
>new_read_s in.sdf -ignore_error -sum
```

would behave the same as

```
>read_sdf in.sdf -continue_on_error -report_summary
```

Note: Tcl partial command matching works if the partial command is unique as shown in the above example, but the alias argument names are private, and will not support partial option matching, or appear in the `-help` output.

Related Topics

- `define_proc_arguments`
- `parse_proc_arguments`

bindKey

```
bindKey key cmd
[-help]
```

Enables you to create keyboard shortcuts.

You can use this command at any time after starting the Innovus software.

Parameters

`-help`	Prints a brief description that includes type and default information for each `bindkey` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man bindkey`
`key`	Specifies the key to be used as the shortcut. You can specify a: • Single Key-Specify any one of the following keys: ◦ `a - z` ◦ Function keys: use `F1 - F12` ◦ Arrow keys: use `Up Down Left Right` ◦ Number keys ◦ Unshifted punctuation keys: `. , / - =` ◦ Other keys: use `Space`, `Delete`, `Backspace`, or `Esc` • Shift Key Combination-Specify `Shift` as the first key followed by '-' followed by: ◦ `A - Z` ◦ One of the 'shifted' punctuation chars: `~@#$%^&*()_+` ◦ Function keys: use `F1 - F12` ◦ Arrow keys: use `Up Down Left Right` ◦ Other keys: use `Space`, `Delete`, `Backspace`, or `Esc` • Ctrl/Alt Key Combination-Specify `Ctrl` or `Alt` as the first key followed by '+' followed by any of the single keys above *Data_type*: string, optional
`cmd`	Specifies the command to be executed when key is pressed. *Data_type*: string, optional

Example

- Runs the `fit` command when you press `f` on your keyboard:

```
bindKey f "fit"
```

- The following example shows how to use `bindKey` when # and @ keys are pressed from GUI.

```
bindKey Shift-@ "setPreference StretchRectilinear 1; setPreference
StretchRestriction 1"
bindKey Shift-# "setPreference StretchRectilinear 0; setPreference
StretchRestriction 0"
```

Related Topics

- Binding Key section of View Menu in *Innovus Menu Reference*

check_ccr

```
check_ccr
[-help]
ccr_number
```

Enables users to check if a CCR (Cadence Change Request) created on their behalf is checked into the current release or not.

The command returns 1 if the specified CCR is integrated into this build and 0 if it is not.

- It includes all integrated CCRs that have the `Checked_In` or `Validated` status at the time of the build.
- It only includes master CCRs. Duplicate CCRs are not included.
- It currently lists all CCRs fixed in the current release stream or previous release. For example, checking in release version 19.11, will find all CCRs integrated into 19.10 through 19.11 that are in the current 19.11 release.

Parameters

`-help`	Prints a brief description that includes type and default information for each `check_ccr` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man check_ccr`
`ccr_number`	Specifies the CCR number to check. *Data_type*: string, required

Examples

- The following example checks if the CCR 123456 is checked into the Innovus release 18.13-s088_1.

```
innovus 1> getversion
18.13-s088_1

innovus 2> check_ccr 123456
1
```

check_syntax

```
check_syntax
[-help]
[file1.tcl file2.tcl ...]
[nagelfar.tcl options]
[-options]
[-out_file fileName]
```

Does the “lint type” checking of Innovus Tcl script files.

It finds many common Tcl errors, such as misspelled commands, using a Tcl variable before setting it.

The `check_syntax` command is a wrapper around the public-domain Tcl linter named nagelfar. Nagelfar automatically loads the Innovus syntax and plugin files and is therefore aware of Innovus commands and options. Nagelfar is available from http://sourceforge.net/projects/nagelfar. A recent version of nagelfar is included in the installation hierarchy at: `<install_dir>/share/nagelfar`.

You can check the nagelfar documentation in the installation directory for details about its options, the checks it performs, and the steps to turn on or off various checks.

To run this command, you should have tclsh in your search path.

Parameters

`-help`	Prints a brief description that includes type and default information for each check_syntax parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man check_syntax`
`file1.tcl` *`file2.tcl`*	Specifies the Tcl files to be checked. *Data_type*: string, optional
`nagelfar.tcl options`	Specifies the native nagelfar.tcl options. See the nagelfar docs in the installation directory for details. *Data_type*: string, optional
`-options`	Calls “nagelfar.tcl –help” to list out all the legal nagelfar options. This option cannot be used with any other options. *Data_type*: bool, optional
`-` `out_file` *`fileName`*	Sends the output to the specified file, rather than the default of stdout. *Data_type*: string, optional

Examples

- The following example show the usage of the `check_syntax` command for file `a.tcl`:

```
innovus> check_syntax a.tcl
Checking file a.tcl
Line 2: W Unknown command "typo_in_cmd_name"
Line 3: E Unknown variable "abc"
```

checkNetlist

```
checkNetlist
-outfile filename
[-includeSubModule]
```

Performs several checks on the design netlist and creates a report. The report provides the following information:

- Design Summary
- Design Statistics
- I/O Pad Summary
- Design Rule Checking
- Submodule Port Definition Checking (optional)

You can use this command after the design netlist is imported.

Parameters

`-outfile` *filename*	Specifies the name of the file where the report will be written. If no name is specified, the default filename is `checknetlist.rpt`. *Data_type*: string, optional
`-includeSubModule`	If this option is included, `checkNetlist` checks the port definitions for any submodules. *Data_type*: bool, optional

Example

Error conditions are indicated by an asterisk (*) preceding the reported statistic, such as

```
Number of Ports Connect to Core Cells *: 57

Number of Ports Connect to multiple Pads *: 0

Number of Floating Ports *: 0
```

Warnings, or possible errors are indicated by a question mark in front of the statistic, such as

```
Number of undefined Floating Pins ?: 0
```

The following example shows the information contained in the generated by `checkNetlist` report.

```
Design: TOPModule

------ Design Summary:
Total Standard Cell Number (cells) : 5908
Total Block Cell Number (cells) : 4
Total I/O Pad Cell Number (cells) : 0
Total Standard Cell Area ( um^2) : 133864.32
Total Block Cell Area ( um^2) : 366346.56
Total I/O Pad Cell Area ( um^2) : 0.00

------ Design Statistics:
Number of Instatnces : 5912
Number of Nets : 6217
Average number of Pins per Net : 3.69
Maximum number of Pins in Net : 541

------ I/O Pad summary
Number of Primary I/O Ports : 57
Number of Input Ports : 28
Number of Output Ports : 29
Number of Bidirectional Ports : 0
Number of Power/Ground Ports : 0
Number of Ports Connect to Core Cells *: 57
Number of Ports Connect to multiple Pads *: 0
Number of Floating Ports *: 0

------ Design Rule Checking:
Number of Output Pins connect to Power/Ground *: 0
Number of Input Floating Pins *: 1
Number of Output Floating Pins : 245
Number of InOut Floating Pins : 0
Number of UniPort Floating Pins : 0
Number of undefined Floating Pins ?: 0
Number of Multiple Driving Nets *: 1
Number of Parallel Driving Nets : 1
Number of Tristate Driving Nets : 0
Number of Input Floating Nets(No FanIn) *: 0
Number of Output Floating Nets(No FanOut) : 1
Number of Hign Fanout Nets (>50) : 3

------ Sub Module Port Definition Checking
* module arb has 3 port define error
* module accum_stat has 1 port define error
* module tdsp_core_glue has 128 port define error
```

compare_release

```
compare_release
[-help]
[-out_file file_name]
{-base_version release_version | -base_file file_name}
[-target_version release_version | -target_file file_name]
```

Compares two different releases and reports all the added, deleted, or modified commands, arguments, and global variables. It also reports any data-type changes for argument values or globals and any enum value changes.

Parameters

`-help`	Prints a brief description that includes type and default information for each `compare_release` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man compare_release`
`-base_file` *`file_name`*	Specifies the `.info` file of the older base release. *Data_type*: string, optional
`-base_version` *`release_version`*	Specifies the older base release, such as 16.10-p001_1, from *`install`*`/share/innovus/version_info`. *Data_type*: string, optional
`-out_file` *`file_name`*	Specifie the output report file. *Default*: `stdout` *Data_type*: string, optional
`-target_file` *`file_name`*	Specifies the target release .info file to be compared with the older base release .info file. *Data_type*: string, optional
`-target_version` *`release_version`*	Specifies the version, such as 16.20-p002_1, which is compared to the older base release. Looks in *`install`*`/share/innovus/version_info` for the correct `.info` file. *Default*: Current version *Data_type*: string, optional

Example

- The following command compares two releases by first finding the install directories, and the correct .info files to compare.

  ```
  >which innovus

  /tools/innovus18.11/bin/innovus
  ```

  The install directory above is /tools/innovus18.11 (for examples, the 18.1 ISR release).

  Suppose you also have the 18.1 production release in /tools/innovus.18.10. Find the .info files to compare:

  ```
  >ls /tools/innovus18.10/share/innovus/version_info

  innovus.18.10-p006_1.cui.info  innovus.18.10-p006_1.info

  >ls /tools/innovus18.11/share/innovus/version_info

  innovus.18.11-s080_1.cui.info  innovus.18.11-s080_1.info
  ```

  Then, run the `compare_release` command to compare either the legacy (.info.) or Common UI versions (.cui.info):

  ```
  innovus> compare_release \

  -base_file /tools/innovus18.10/share/innovus/version_info/innovus.18.10-
  p006_1.info \

  -target_file /tools/innovus18.11/share/innovus/version_info/innovus.18.11-
  s080_1.info \

  -out_file 18.11.diff
  ```

  The output file will show all the differences between the two releases.

decrypt

```
decrypt
[-help]
file_name
```

Decrypts and evaluates a Tcl file that was encrypted with the encrypt command.

Parameters

`-help`	Prints out the command usage.
`file_name`	Specifies the name of the Tcl file to be decrypted and evaluated. *Data_type*: string, required

Related Topics

- `encrypt`

define_proc_arguments

```
define_proc_arguments
[-help]
command_name
[-info string]
[-define_args string]
[-hide]
```

Defines the arguments and attributes of a Tcl procedure. The arguments and attributes are displayed when you view the help associated with the procedure.

The `define_proc_arguments` command, when used with the `parse_proc_arguments` command, enables you to validate command usage. For invalid commands, appropriate error messages are displayed.

Parameters

`-help`	Prints out the command usage.
`proc_name`	Specifies the name of an existing Tcl procedure. *Data_type*: string, optional
`-info` *`string`*	Provides help information for the procedure. *Data_type*: string, optional
`-define_args` *`string`*	Defines all possible arguments of the Tcl procedure. It can also be used to define the help text and constraints for individual arguments of the procedure and generates the help for command options. The variable *`arg_defs`* is a list of lists where each list element defines one argument. Each element in the list has the following format: `"arg_name" "option_help" "value_help" "data_type" "attributes"` *Data_type*: string, optional
	`arg_name`: Specifies the name of the argument.
	`option_help`: Provides a short description of the argument.
	`value_help`: Specifies the help information for the associated option values.

	data_type: (Optional) Used for validation of options. Supported data types are `string`, `list`, `boolean`, `int`, `integer`, `float`, or `one_of_string`. *Default:* `string`
	attributes: (Optional) Used for validation of options. The attributes can be: • `required`: This argument must be specified . This is mutually exclusive with `optional` and `internal`. • `optional`: Specifying this argument is optional. This is mutually exclusive with `required`. • `internal`: Disables the display of help information for the option in the procedure help. This argument is mutually exclusive with `required`. • `value_help`: Indicates that the valid values for `one_of_string` argument should be listed whenever argument help is shown. • `values {`*`allowable_values`*`}`: This argument must be used with the `one_of_string` data type. • `merge_duplicates` : Ensures that when the option appears more than once in a command, its values are concatenated into a list of values. The default behavior is that the right-most value specified for the option is used. • `bind_option` *`other_arg_name`*: Binds the current option with the option specified as the *`other_arg_name`* variable. • `mutual_exclusive_group` *`group_name`*: Defines a group name and includes the current option in the *`group_name`* group. All options in the same group are treated as mutually exclusive. • *Default:* `optional`
`-hide`	Hides the procedure and its body. *Data_type*: bool, optional

Examples

The following Tcl procedure uses the `define_proc_arguments` command for defining arguments and attributes, and for validating the command usage.

```
proc cmdProc {args} {

parse_proc_arguments -args $args results

foreach argname [array names results] {

puts "$argname = $results($argname)"

}

}

define_proc_arguments cmdProc -info "Command Description" \

-define_args \

{{-string "String help" "string_val" string optional}

{-integer "Int help" "int_value" int optional}

{-Bool "Bool_help" "bool_value" boolean optional}

{-list "List help" "list_value" list {optional bind_option -Bool}}

{-boolean_a "BoolA help" "" boolean {optional mutual_exclusive_group

g0}}

{-boolean_b "BoolB help" "" boolean {optional mutual_exclusive_group

g0}}

{-float_num "Float help" "float_value" float}

{-oosa "One of StringA help" "one_of_str_value" one_of_string

{optional value_help {values {v1 v2}}}}

{-oosb "One of StringB help" "one_of_str_value" one_of_string

{optional {values {v4 v5}}}}

}
```

Now, if the `cmdProc` procedure is invoked with the `-help` option at the command prompt, the following help information is displayed.

```
cmdProc -help
```

```
Usage: cmdProc # Command Description

[-string string_val] (String help)

[-integer int_value] (Int help)

[-list list_value] (List help, Bind_Option=-Bool)

[-boolean_a ] (BoolA help, Mutual_Exclusive_Group=g0)

[-boolean_b ] (BoolB help, Mutual_Exclusive_Group=g0)

[-float_num float_value] (Float help)

[-oosa one_of_str_value] (One of StringA help, Values={v1 v2 })

[-oosb one_of_str_value] (One of StringB help)
```

Related Topics

- parse_proc_arguments

deleteDangling1b1Or0s

```
deleteDangling1b1Or0s
-help
```

Deletes dangling 1'b1s or 1'b0s from the Verilog. They are either dangling nets assigned 1'b1 or 1'b0 or 1'b1/1'b0 connections that are not hierarchically connected to a leaf instance.

Parameters

None

Example

In the code below only BUFX2 is a leaf.

```
//
// Original Verilog
module hier4 (A,B);
input A;
input B;

BUFX2 u0 (.A(A));
BUFX2 u1 (.A(1'b1));
endmodule

module hier3 ();

hier4 u0 (.A(1'b1),.B(1'b0));
hier4 u1 (.A(1'b0),.B(1'b1));
endmodule

module hier2 ();

hier3 u0 ();
endmodule

module top ();

// Internal wires
wire a;
wire b;
wire c;
wire d;

assign a = 1'b1 ;
```

```
assign b = 1'b1 ;
assign c = 1'b0 ;
assign d = 1'b0 ;

hier2 u0 ();
BUFX2 u1 (.A(a));
BUFX2 u2 (.A(c));
endmodule

//
// Verilog after deleteDangling1b1Or0s is issued

module hier4 ( A, B);
input A;
input B;

BUFX2 u0 (.A(A));
BUFX2 u1 (.A(1'b1));
endmodule

module hier3 ();

hier4 u0 (.A(1'b1));
hier4 u1 (.A(1'b0));
endmodule

module hier2 ();

hier3 u0 ();
endmodule

module top ();

// Internal wires
wire a;
wire c;

assign a = 1'b1 ;
assign c = 1'b0 ;

hier2 u0 ();
BUFX2 u1 (.A(a));
BUFX2 u2 (.A(c));
endmodule
```

deleteDanglingPort

```
deleteDanglingPort
[-help]
[-ptn]
```

Deletes module ports that are disconnected on the outside.

Parameters

`-help`	Prints a brief description that includes type and default information for each `deleteDanglingPort` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deleteDanglingPort`
`-ptn`	Evaluate for deletion only ports on partition boundaries. *Data_type*: bool, optional

Examples

Delete all dangling ports on all partitions

```
deleteDanglingPort -ptn
```

deselect_obj

```
deselect_obj
[-help]
{[-all ] | [obj_list]}
```

Deselects the specified object or the list of objects from the Viewer. The object type can be any object type drawn on GUI such as instance wire, via instance.

Parameters

`-help`	Prints a brief description that includes type and default information for each `deselect_obj` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deselect_obj`
`-all`	Deselects all objects. *Data_type*: bool, optional
obj_list	Specifies the list of objects to be deselected. *Data_type*: (any_object)+, optional

Example

The following command deselects the instance name i1.

```
deselect_obj [dbGet top.insts.name i1 -p]
```

Related Topics

- `select_obj`

encMessage

```
encMessage
[-help]
msgType
valStr
```

Specifies whether to enable the display of warning, information, or debug messages.

Parameters

`-help`	Prints a brief description that includes type and default information for each `encMessage` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man encMessage`
`msgType`	Specifies the type of message you want to enable or disable. Type can be: • `warning` • `info` • `debug` *Data_type*: string, required
`valStr`	Controls the display of the messages. Use `0` to disable and `1` to enable messages. *Data_type*: string, required

Example

- The following command disables the display of all information messages:

  ```
  innovus 1> encMessage info 0
  ```

- By default, the tool displays the warning, information, or debug messages for each command executed. The following example shows the information that the tool displays after `selectRow` and `setDesignMode` commands are executed:

  ```
  innovus 2> selectRow 10 10 1
  selectRow finished.
  ```

  ```
  innovus 3> setDesignMode -process 45
  Applying the recommended capacitance filtering threshold values for 45nm process
  node: total_c_th=0, relative_c_th=1 and coupling_c_th=0.1.
  These values will be used by all post-route extraction engines, including
  TQuantus, IQuantus and Quantus QRC extraction.
  Capacitance filtering mode(-capFilterMode option of the setExtractRCMode) is
  'relAndCoup' for all engines.
  The accuracy mode for postRoute effortLevel low extraction will be set to 'high'.
  Default value for EffortLevel(-effortLevel option of the setExtractRCMode) in
  postRoute extraction mode will be 'medium' if Quantus QRC technology file is
  specified else 'low.
  ```

  You can suppress these information messages using the `encMessage` command. To suppress the information messages in log, specify `0` as the value for `info`. For example:

  ```
  innovus 4> encMessage info 0
  ```

  After the above setting, no message is displayed when commands are executed. However, this setting cannot be done for any specific command. To enable the display of information messages, specify `1` as the value for `info` as given below:

  ```
  innovus 5> encMessage info 1
  ```

encrypt

```
encrypt
[-help]
input_file_name
[-pragma]
[> file]
[-tcl  | -verilog ]
```

Encrypts a file in an nc-protect compatible format.

Parameters

`-help`	Prints out the command usage.
input_file_name	Specifies the file to be encrypted. *Data_type*: string, required
> file	Specifies the name of the encrypted file. By default, the encrypted file is printed to standard out (stdout). *Data_type*: redirect_operator, optional
`-pragma`	Specifies to only encrypt the text between the protect begin and protect end NC Protect pragmas. Encryption block must start with pragma protect comment. *Data_type*: bool, optional
`-tcl`	Specifies that the file to be encrypted is a Tcl file. This is the default option. *Data_type*: bool, optional
`-verilog`	Uses Verilog style comments for NC Protect pragmas. *Data_type*: bool, optional

Related Topics

- `decrypt`

eval_common_ui

```
eval_common_ui
[-help]
script
```

Runs a Stylus Common UI command in the legacy interpreter. This command is not required in the normal usage. However, it may be needed when there is a transition period, that some scripts are already converted into Common UI style, but you still need to run the flow in legacy. This command is intended as a temporary workaround as you transition to the Stylus Common UI and will be removed in a future release.

Most Stylus Common UI commands are available, but the commands that have behavior difference from legacy will not work properly (for example, write_db, read_db, read_netlist, read_physical, read_mmmc, init_design, and report_timing).

These commands will not work and give error messages:

Initialization commands (legacy uses globals and its own version of init_design)

- `read_mmmc`
- `read_netlist`
- `read_physical`
- `init_design`

Some timing commands that have different formatting and controls:

- `report_timing`
- `report_critical_insts`

Commands that only work with Stylus logging:

- `set_log_post_cmd`

The CUI only supports MMMC2 and does not support MMMC1 usage. So the following commands have limitations:

Command	Limitation
`read_db`	Can only read an MMMC2 DB, saved by either the legacy saveDesign or CUI write_db command. An MMMC1 DB will cause an error.

`write_db`	Can only save an MMMC2 DB (if the current DB is MMMC1 an error occurs)
`write_mmmc`	Not supported

See the legacy global `init_mmmc_version` for more info about how to load an MMMC2 file into legacy during initialization. You can also use `saveDesign -mmmc2` to convert a legacy MMMC1 DB in memory to a saved MMMC2 DB.

The Stylus Common UI commands run in a separate Tcl interpreter. Therefore, Tcl variables in the current interpreter are not available. That means the script should normally be inside " " rather than { } so that the Tcl variable substitution occurs in the current interpreter before passing the script to the Stylus Common UI Tcl interpreter.

If a TCL_ERROR is returned by any command inside a *script*, the *script* stops executing, and `eval_common_ui` returns a TCL_ERROR.

Parameters

`-help`	Prints a brief description that includes type and default information for each `eval_common_ui` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man eval_common_ui`.
`script`	Specifies one or more Stylus Common UI Tcl commands to run in the Stylus Common UI Tcl interpreter. *Data_type*: string, required

Examples

- The following command runs the finish_floorplan command in the CUI Tcl interpreter.

  ```
  eval_common_ui "finish_floorplan"
  ```

- If you want a Tcl var from the legacy Tcl interpreter available inside the CUI interpreter script, you should protect it with “” to force Tcl var substitution in the legacy interpreter like this:

  ```
  set inst i1
  eval_common_ui “get_db insts -if {.name == $inst}”
  ```

  The $inst will be substituted to result in ‘get_db insts -if {.name == i1}’ before eval_common_ui sees it and passes it to the CUI interpreter.

- If you want to use CUI Tcl vars inside the CUI interpreter, you should protect them with { } like this to avoid substitution in the legacy interpreter:

  ```
  eval_common_ui {set i [get_db insts -if {.base_cell.name == AND2X}] get_db $i
  .name}
  ```

  The Tcl var $i is only used inside the CUI interpreter, and not added to the legacy interpreter.

- If you have a few global Tcl vars in the legacy interp to pass into a common CUI script, you could add them in separate eval_common_ui calls like this:

  ```
  set glob1 test
  set glob2 test2
  eval_common_ui “set glob1 $glob1”   This command sets CUI glob1 to legacy $glob1
  eval_common_ui “set glob2 $glob12”  This command sets CUI glob2 to legacy $glob2
  eval_common_ui “source my.tcl”      CUI my.tcl can use both globals
  ```

find_global

```
find_global
[-help]
[pattern | -non_default ]
[[-tcl ] | [[-name ] [-value ] [-type ] [-default ] [-info ] [-range_or_enum ] [-
transient ]]]
```

Returns all the public variables. If you want to retrieve specific global variables, you can use patterns with this command.

Parameters

`-help`	Prints a brief description that includes type and default information for each `find_global` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man find_global`.
pattern	Specifies a string with wildcards that can be used to retrieve specific global variables. *Data_type*: string, optional
`-default`	Displays the default value of variables. If a pattern is specified, displays default value of all variables matching the specified pattern. *Data_type*: bool, optional
`-info`	Displays the description of variables. If a pattern is specified, displays description of all variables matching the specified pattern. *Data_type*: bool, optional
`-name`	Displays the name of all or specified global variables. *Data_type*: bool, optional
`-non_default`	Displays the list of variables whose values are not default. **Note**: If neither `pattern`, nor `-non_default` is specified, the tool displays all variables. *Data_type*: bool, optional

`-range_or_enum`	Displays the range or legal enum value list, if they exist, for all or specified global variables. *Data_type*: bool, optional
`-tcl`	Returns a tcl list that has every field value of the specified variables. If a pattern is not specified, displays this information for all global variables. *Data_type*: bool, optional
`-transient`	Displays whether the specified variable is transient. If a pattern is not specified, displays this information for all global variables. *Data_type*: bool, optional
`-type`	Displays the type (`Boolean`, `Integer`, `String`, `Enum`) of all or specified variables. *Data_type*: bool, optional
`-value`	Displays the current value of all or specified variables. *Data_type*: bool, optional

Example

- The following command returns all public variables and private variables with a non-default value:
  ```
  find_global
  ```
- The following command returns all public global variables (and private variables with a non-default value) beginning with `dbg`.
  ```
  find_global dbg*
  ```

  Output:

  ```
  dbgAllowInferredTriStateArcs 1 # (Integer, default=1, persistent)
  # Controls whether arcs from a tristate enable to a inferred as tristate
  # enable and disable arcs if they are not explicitly specified by the Liberty
  # timing_type attribute. This functionality is mainly to support older
  # modeling styles in legacy libraries.
  dbgConvertSetupHoldOnAsyncToRecRem 1 # (Integer, default=1, persistent)
  # Controls whether single-edged setup and hold checks on asynchronous pins
  ```

```
# in the Liberty library are inferred as recovery and removal checks. This
# is mainly to support older modeling styles in legacy libraries.
dbgPicoSecPerDBU 0.1 # (Double, default=0.1, persistent)
# Controls how timing library numbers are internally scaled to database
# units. The default is 1/10 pS per DBU. To represent very large delay
# numbers accurately this value can be increased as needed. This variable
# should be set before timing libraries are read.
dbgUseDuplicateTimeArc 1 # (Integer, default=1, persistent)
# This variable controls whether or not redundant timing arcs (no retain
# or conditional variance) are supported. This variable is obsolete and
# will be removed from future releases of the software.
```

- The following command returns information on a specific variable, `lefDefOutVersion`.

  ```
  find_global lefDefOutVersion
  ```

  The output is as follows:

  ```
  lefDefOutVersion "" # (String, default="", persistent)
  # Specify LEF/DEF output version. Possible string value are 5.3, 5.4, 5.5,
  # 5.6, 5.7 and 5.8.
  ```

- The following command returns names and default information for all global variables starting with the pattern `def`.

  ```
  find_global def* -name -default
  ```

  The output is as follows:

  ```
  defHierChar # (default="")
  defInShapeBasedDefFile # (default=0)
  defOutBumpAsInstance # (default=1)
  defOutLefNDR # (default=0)
  defOutLefVia # (default=0)
  defOutPolygonDieArea # (default=1)
  defOverlapWireReportFileName # (default="")
  ```

- For complete list of public globals returned by `find_global`, see:

- "Appendix B: Tcl Globals" chapter in *Innovus Text Command Reference*.

generateFFSetupFile

```
generateFFSetupFile
[-help]
```

Starts the foundation flow on Innovus.

Parameters

`-help`	Outputs a brief description for `generateFFSetupFile`. For a detailed description of the command and all of its parameters, use the `man` command: `man generateFFSetupFile`.

Related Topics

- Design Implementation Flow chapter of the of the *Innovus User Guide*

get_message

```
get_message
-help
-id msgID
{-severity | -limit | -suppress | -count | -short | -long | | -on_error | -
stop_script_limit | -detail}
```

Gets the limit, severity, or suppression for a message.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_message` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_message`
`-count`	Returns the number of times this message has been issued this session. *Data_type*: bool, optional
`-detail`	Returns the message of specified id. *Data_type*: bool, optional
`-id msgID`	Specifies a single message ID, in the form "ENCFOO-123". *Data_type*: string, required
`-limit`	Returns the limit for the specified message as an integer. -1 is unlimited. 0 is suppressed. *Data_type*: bool, optional
`-long`	Returns the long message description, as used for the Description section in "`man msgID`" *Data_type*: bool, optional
`-on_error`	Returns the error action for the specified message. *Data_type*: bool, optional

`-severity`	Returns the severity, `error`, `warn`, `info`, or `default`, of the specified message as a string. *Data_type*: bool, optional
`-short`	Returns the short message description. Equivalent to "`help` *`msgID`*" . *Data_type*: bool, optional
`-stop_script_limit`	Returns the message limit allowed for every public command. Message limit set as -1 means unlimited. *Data_type*: bool, optional
`-suppress`	Returns `1` if the message is suppressed, `0` if not suppressed. *Data_type*: bool, optional

get_metric

```
get_metric
-help
[-branch list_of_patterns]
[-exclude_inherited]
[-id id_name]
[-names label_name]
pattern_name
[-pending]
[-raw]
```

Gets the current state of metric(s).

You can use this command to query the current state of any metric or metrics from the current specified list of metrics as well as a previous state.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_metric` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_metric`
`-branch` *`list_of_patterns`*	Specifies list of patterns to match snapshot branches. This will limit all output to metrics stored in snapshots whose branch matches the specified branch. This requires any inheritance to be re-run to exclude inherited values from non-matching snapshots. *Data_type*: string, optional
`-exclude_inherited`	Specifies not to return any inherited value. *Data_type*: bool, optional
`-id` *`id_name`*	Specifies the database ID to output. Default is current database. *Data_type*: string, optional
`-names` *`label_name`*	List of patterns to match snapshot names Name of label to get metrics from (wildcards supported); no label reports current metrics. *Data_type*: string, optional
`pattern_name`	Specifies the list of patterns to match metrics. Supports wildcard *. Use of * gets all metrics. *Data_type*: string, optional
`-pending`	Returns metrics from the pending (not yet created) snapshot. *Data_type*: bool, optional
`-raw`	Returns metrics as raw value (without normalization to defined units). *Data_type*: bool, optional

Related Topics

- encEnableMetric

getAllLayers

```
getAllLayers
[-help]
[{object display multi internal module metal color custom oaLayout}]
```

Returns a complete list of all layers and floorplan object settings. If you specify type, the software returns all the layers of the specified type. This command can be used at any stage in the design flow.

Parameters

`-help`	Prints a brief description that includes type and default information for each `getAllLayers` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man getAllLayers`
`{object display multi internal module metal color custom oaLayout}`	Specifies the type of the layer. Innovus supports nine types of layers, which can be specified as follows: • `object`: Returns object layers, which represent db objects, such as instances, modules, pins, and so on. • `display`: Returns display-only or view-only layers, including flightlines, rulers, and congestion. • `multi`: Returns multiple color layers, such as congestion and yield maps. • `internal`: Returns internal layers, such as bump layers, structured data path layers, etc. • `module`: Returns module layers, which are layers associated with hinsts. • `metal`: Returns wire/via layers, including metal/via, pin, and blockage. • `color`: Returns color layers. • `custom`: Returns custom layers, which are used to represent custom objects and GDSII data. • `oaLayout`: Returns oaLayout layers. *Data_type*: enum, optional

Example

Returns all metal layer names:

```
getAllLayers metal
```

Related Topics

- Getting Started chapter of the *Innovus User Guide*.

getBuildArch

```
getBuildArch [-help]
```

Reports whether the Innovus session is running in 32-bit or 64-bit mode.

Parameters

`-help`	Prints a brief description of the command.

getCheckMode

```
getCheckMode
[-all]
[-checkIlm]
[-extraction]
[-floorplan]
[-globalNet]
[-integrity]
[-io]
[-library]
[-mgrid]
[-netlist]
[-placement]
[-route]
[-sroute]
[-tapeOut]
[-timingGraph]
[-vcellnetlist]
```

Returns information about the specified `setCheckMode` parameter in the log file and in the console. The following information is returned:

- Parameter name
- Current value
- Type (Boolean, string, and so on)
- Whether the current value was set by user

If you do not specify a parameter, the software displays information for all of the `setCheckMode` parameters.

Parameters

-parameter_names	
	Displays information for the specified parameters. You can specify one or more parameters. See `setCheckMode` for descriptions of the data checking parameters you can specify.

Examples

- The following command displays the current setting for the `-extraction` parameter:

  ```
  getCheckMode -extraction
  ```

  The software displays the following information:

  ```
  -extraction false # bool, default=false

  false
  ```

- The following command displays the current setting of the `-extraction` parameter in Tcl list format:

  ```
  getCheckMode -extraction -quiet
  ```

  The software displays the following information:

  ```
  false
  ```

- The following command displays the current settings of the `-floorplan` and `-placement` parameters:

  ```
  getCheckMode -floorplan -placement
  ```

  The software displays the following information:

  ```
  -floorplan false # bool, default=false

  -placement false # bool, default=false

  {floorplan false} {placement false}
  ```

- The following command displays the current settings of the `-floorplan` and `-placement` parameters in Tcl list format:

  ```
  getCheckMode -floorplan -placement -quiet
  ```

  The software displays the following information:

```
{floorplan false} {placement false}
```

Related Topics

- Importing and Exporting Designs chapter of the *Innovus User Guide*.

getCompressLevel

`getCompressLevel`

Displays the current compression speed level used for compressing large data files. Compression speed is controlled with the `setCompressLevel` command.

Related Topics

- `setCompressLevel`

getLayerPreference

```
getLayerPreference
[-help]
layer_name
{-isVisible | -isSelectable | -color | -lineWidth | -stipple | -stippleData}
```

Provides information about a single preference for a single object.

See `setLayerPreference` for descriptions of how to set layer preferences.

Parameters

`-help`	Prints a brief description that includes type and default information for each `getLayerPreference` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man getLayerPreference`
`-color`	Provides information about the color of the object. A color name or a numeric RGB value is returned. *Data_type*: bool, optional
`-isSelectable`	Provides information about whether the object is selectable. If a value of `1` is returned, the object is selectable. If a value of `0` is returned, the object is not selectable. *Data_type*: bool, optional
`-isVisible`	Provides information about whether the object is visible. If a value of `1` is returned, the object is visible. If a value of `0` is returned, the object is not visible. *Data_type*: bool, optional
`layer_name`	Provides the name of the layer or the object type. *Data_type*: string, required
`-lineWidth`	Provides information about the number of pixels in the border of the specified object. An integer value is returned. *Data_type*: bool, optional
`-stipple`	Provides information about the stipple pattern of the object. A stipple name is returned. *Data_type*: bool, optional
`-stippleData`	Provides information about the width and height of the stipple pattern. This information is in x-window bitmap format. *Data_type*: bool, optional

Example

Returns the color for `Metal1` objects:

```
getLayerPreference Metal1 -color
```

Related Topics

- `setLayerPreference`

getPreference

```
getPreference
[-help]
preference_name
```

Returns the current preference settings.

Parameters

`-help`	Prints out the command usage
preference_name	Specifies the name of a preference. *Data_type*: string, optional

Related Topics

- setPreference

getVersion

```
getVersion
[-help]
[-major]
```

Returns the Innovus software version number.

Parameters

`-help`	Prints a brief description of the command. For a detailed description of the command, use the `man` command: `man getVersion`
`-major`	Returns the major version and one digit after the decimal point. *Data_type*: bool, optional

Examples

- The following command returns the software version:

  ```
  innovus 7> getVersion
  20.10-d251_1
  ```

- The following command gives the major version of the software:

  ```
  innovus 8> getVersion -major
  20.1
  ```

gui_get_legend

```
gui_get_legend
[-help]
-type {inst_density pin_density timing_map metal_density route_congestion temperature}
[-display_range | -value_range | -show_legend_on_layout | -legend_location | -
enable_min_value | -enable_max_value]
```

Gets the current legend setting.

You can use the `gui_set_legend` and `gui_get_legend` commands to get the snapshot of different density for analysis.

Parameters

`-help`	Prints a brief description of the command. For a detailed description of the command, use the `man` command: `man gui_get_legend`
`-display_range`	Gets the display range
`-enable_max_value`	Gets the state of the max value of display range.
`-enable_min_value`	Gets the state of the min value of display range.
`-legend_location`	Gets the location of legend.
`-show_legend_on_layout`	Gets the state of legend on layout.
`-type {inst_density pin_density timing_map metal_density route_congestion temperature}`	Gets the setting for the specified legend type.
`-value_range`	Gets the value range.

Example

The following command sets the legend for the inst_density legend type:

```
> gui_set_legend -type inst_density -display_range {1 0.9} -show_legend_on_layout true
```

The following command gets the current legend setting for the `inst_density` legend type.

```
> gui_get_legend -type inst_density
{display_range {0.9 0.9}} {legend_location ne} {show_legend_on_layout true}
{value_range {0.75 1}}
```

Related Information

- `gui_set_legend`

gui_set_legend

```
gui_set_legend
[-help]
[-display_range {x y}]
[-enable_max_value {true false}]
[-enable_min_value {true false}]
[-legend_location {ne nw se sw}]
[-reset -display_range|-value_range|-show_legend_on_layout|-legend_location|-
enable_min_value|-enable_max_value]
[-show_legend_on_layout {true false}]
-type {inst_density pin_density timing_map metal_density route_congestion temperature}
[-value_range {x y}]
```

Specifies the legend setting.

You can use the `gui_set_legend` and `gui_get_legend` commands to get the snapshot of different density for analysis.

Parameters

`-help`	Prints a brief description of the command. For a detailed description of the command, use the `man` command: `man gui_set_legend`
`-display_range {x y}`	Specifies the display range in the {min max} format
`-enable_max_value {true false}`	Enables the max value of the display range.
`-enable_min_value {true false}`	Enables the min value of the display range.
`-legend_location {ne nw se sw}`	Specifies the location of legend.
`-reset -display_range|-value_range|-show_legend_on_layout|-legend_location|-enable_min_value|-enable_max_value`	Resets the settings of the specified option, `-reset -display_range|-value_range|-show_legend_on_layout|-legend_location|-enable_min_value|-enable_max_value`. You can reset all options by using `-reset all`.
`-show_legend_on_layout {true false}`	Specifies to show the legend on layout.
`-type {inst_density pin_density timing_map metal_density route_congestion temperature}}`	Specifies the setting for the specified legend type.
`-value_range {x y}`	Specifies the value range in the {min max} format.

Example

The following command sets the legend for the inst_density legend type:

```
> gui_set_legend -type inst_density -display_range {1 0.9} -show_legend_on_layout true
```

The following command gets the current legend setting for the `inst_density` legend type.

```
> gui_get_legend -type inst_density
{display_range {0.9 0.9}} {legend_location ne} {show_legend_on_layout true}
{value_range {0.75 1}}
```

Related Information

- gui_get_legend

help

```
help
[-help]
[-k keyword| -cmd commandName| -var] [pattern]
```

Displays information, such as command syntax, summary of messages, list of commands, based on the specified argument. Displays the following information:

- Syntax of a command or global variable.
- Summary of the message text based on the specified message ID.
- List of commands based on keywords.
- List of commands based on search string.

Command Syntax

To display the syntax of a command or a variable, use the following command:

```
help commandName
```

The command syntax output is written in the log file and displayed in the Innovus console.

Message Summary

To display a summary of the message text for a particular message ID, use the following command:

```
help msg_id
```

Shows the summary of message text for the message ID specified.

Keyword Searches

To perform a keyword search, use the following command:

```
help -k keyword
```

Shows a list of commands with the specified keyword.

Note: Keyword-based searches are case insensitive.

Partial String Searches

To perform a partial string search, use the following command:

`help *string*`

Shows all commands containing the specified string. The search results vary depending on whether you use wildcards (*) in the beginning, end, or middle of the string.

Note: Partial string searches are case insensitive.

Parameters

`-cmd` *commandName*	Displays help for the specified command name. If you do not specify a command name, all officially supported Innovus commands are displayed. *Data_type*: bool, optional
`-k` *keyword*	Searches for the specified keyword and displays all commands associated with that keyword. *Data_type*: bool, optional
pattern	Specifies command pattern, message id or keyword. *Data_type*: bool, optional
`-var`	Performs variable search only. *Data_type*: bool, optional

Examples

- The following command prints the command syntax for the `setRouteMode` command:
  ```
  help setRouteMode
  ```
- The following command shows the message summary for the `ENCSYC-139` message ID:
  ```
  help ENCSYC-139
  ```
- The following command displays all commands that include "place" as a keyword:
  ```
  help -k place
  ```
- The following commands show how wildcards can be used in string searches:
  - Use wildcards at the beginning of the string to get all commands that end with the

specified string:

```
innovus 3> help *_timing

 Multiple commands found:
  check_timing
  compare_model_timing
  get_constant_for_timing
  report_cell_instance_timing
  report_clock_timing
  report_timing
  reset_disable_timing
  set_disable_timing
  write_model_timing
```

- Use wildcards in the middle of the string when you are not sure what comes in the middle of the string:

```
innovus 4> help report*timing

 Multiple commands found:
  report_cell_instance_timing
  report_clock_timing
  report_timing
```

- Use wildcards at the end of the string to get all commands that begin with the specified string:

```
innovus 5> help report_tim*

 Multiple commands found:
  report_timing
  report_timing_derate
  report_timing_format
```

- Use wildcards at the beginning and end of the string to get a list of all the commands that contain the string:

```
innovus 6> help *timing*

 Multiple commands found:
  checkTimingLibrary
  checkWhatIfTiming
  check_timing
  compare_model_timing
  deleteWhatIfTimingAssertions
  deriveTimingBudget
  getWhatIfTimingAssertions
```

. . .

is_common_ui_mode

```
is_common_ui_mode
[-help]
```

Checks if the Stylus Common UI mode is enabled. This command is helpful if you are using both Common UI and Legacy UI, and you want to source their respective script based on the value returned by `is_common_ui_mode`. In such scripts, if `is_common_ui_mode` returns 1, Stylus Common UI commands will be sourced, and if it returns 0, Legacy UI commands will be sourced.

For example, you can write a script, which can be sourced irrespective of UI, as below.

```
if {[is_common_ui_mode]}

{
<Common UI commands>
}

else

{
<Legacy UI commands>
}
```

Parameters

None

Example

The following example checks it on the Innovus prompt:

```
@innovus> is_common_ui_mode

1

innovus> is_common_ui_mode

0
```

Return value `1` indicates that the Stylus Common UI mode is enabled.

lminus

```
lminus
[-exact]
list1
list2
```

Subtracts the specified elements in the second list (*list2*) from the first specified list (*list1*) .

Parameters

-exact	Searches for an exact match.
list1	Specifies the list from which elements must be removed.
list2	Specifies the list of elements to be subtracted.

Examples

- The following command subtracts the elements from list l2 from list l1.

```
innovus> set l1 {a a* ab2 b1 b2 c}
innovus> set l2 {a c}
innovus> lminus $l1 $l2
a* ab2 b1 b2
```

- The following command subtracts a list consisting of a* and c from the list of elements of l1.

```
innovus> lminus $l1 {a* c}
b1 b2
```

- The following command uses an exact search.

```
innovus> lminus -exact $l1 {a* c}
a ab2 b1 b2
```

man

```
man
command_name | msg_id
```

This command is a Tcl wrapper that calls the Linux ‘man’ command, so you can see man pages for Innovus commands, Innovus Tcl global variable, or other Linux commands. The man-page directories inside the Innovus installation are automatically added to the beginning of the Linux environment variable MANPATH so you will see Innovus man-pages before any other man-pages in your MANPATH.

The only exception is if the argument matches the msg_id format (e.g. several letters with a dash followed by an integer like ‘ABC-123’)., the Tcl wrapper directly returns the msg_id message you would see in the log file, along with any extended help description if it is available for that msg_id. These msg_id ‘man-pages’ are not included in the man-page directories, but are only available inside Innovus.

For all other arguments, it just calls the Linux ‘man’ command with the proper MANPATH, so you can use any Linux ‘man’ options as described in the Linux man-page for ‘man’.

For information on setting up MANPATH for Stylus Common UI commands directly from Linux, see Setting Up the Run-Time Environment in the *Getting Started* chapter of the *Innovus User Guide*.

Parameter

command_name	Indicates the name of the text command (or variable) for which the manual information is required.
msg_id	Specifies a message ID in the format like ‘ABC-123’. The output will show the log file message and any extended help description that can include likely causes, possible fixes, and possible workarounds for this msg_id.

Example

- The following command returns the manual description of the command `report_timing`:

  ```
  man report_timing
  ```

- The following command returns the manual description of the IMP`SYC-139` message ID. Some messages have extra man help, beyond what the original error or warning message says.

  ```
  man IMPSYC-139
  ```

parse_proc_arguments

```
parse_proc_arguments
[-help]
result_array
[forced_proc]
-args string
```

Supports argument validation within a Tcl procedure and enables the use of the `-help` option to view the help information associated with the procedure.

Procedures using the `parse_proc_arguments` command will validate the arguments. If the required arguments are missing or have invalid values, the `parse_proc_arguments` command generates a Tcl error and the calling procedure terminates.

The `parse_proc_arguments` command must be the first command called in the procedure. This command cannot be used outside of a procedure.

Parameters

`-help`	Prints out the command usage.
`-args string`	Specifies the list of arguments passed to the Tcl procedure. *Data_type*: string, required
result_array	Specifies the result array into which the parsed arguments are to be stored. *Data_type*: string, required
forced_proc	Specifies the name of the invoking procedure. *Data_type*: string, optional

Examples

The following Tcl procedure uses the `parse_proc_arguments` command for argument validation.

```
proc cmdProc {args} {

parse_proc_arguments -args $args results

foreach argname [array names results] {

puts "$argname = $results($argname)"
```

```
}

}

define_proc_arguments cmdProc -info "Command Description" \

-define_args \

{{-string "String help" "string_val" string optional}

{-integer "Int help" "int_value" int optional}

{-list "List help" "list_value" list {optional bind_option -Bool}}

{-boolean_a "BoolA help" "" boolean {optional mutual_exclusive_group g0}}

{-boolean_b "BoolB help" "" boolean {optional mutual_exclusive_group g0}}

{-float_num "Float help" "float_value" float}

{-oosa "One of StringA help" "one_of_str_value" one_of_string {optional value_help
{values {v1 v2}}}}

{-oosb "One of StringB help" "one_of_str_value" one_of_string {optional {values {v4
v5}}}}

}
```

Now, if the cmdProc procedure is invoked using the following command at the command prompt, argument validation takes place and the following errors are reported.

```
innovus> cmdProc -boolean_a -boolean_b

**ERROR: Options '-boolean_a -boolean_b' are mutually exclusive for 'cmdProc'.

Usage: cmdProc [-string string_val] [-integer int_value] [-list list_value] [-boolean_a
]

[-boolean_b ] [-float_num float_value] [-oosa one_of_str_value {v1 v2 }] [-oosb
one_of_str_value]]

**ERROR: Errors in 'cmdProc'.
```

The following command to invoke the cmdProc procedure will also return the errors shown below.

```
innovus> cmdProc -oosa v5

**ERROR:  The arguments specified (v5) in cmdProc -oosa are not valid. Refer to the
documentation for valid arguments.

Usage: cmdProc [-string string_val] [-integer int_value] [-list list_value] [-boolean_a
```

```
]

[-boolean_b ] [-float_num float_value] [-oosa one_of_str_value {v1 v2 }] [-oosb
one_of_str_value]]

**ERROR: Errors in 'cmdProc'.
```

placeCursor

```
placeCursor
[-help]
x y
```

Places the cursor at the specified location in the main window.

You can specify this command at any time after starting the Innovus software.

Parameters

`-help`	Prints a brief description that includes type and default information for each `placeCursor` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man placeCursor`
x	Specifies the x coordinate of the cursor location. *Data_type*: float, required
y	Specifies the y coordinate of the cursor location. *Data_type*: float, required

Example

The following command places the cursor at the coordinates (`133`, `277`).

```
placeCursor 133 277
```

print_message

```
print_message
-help
[-id msgID | formatString]
[args]
[-error]
[-warning]
```

Generates a message that is included in the `report_message` output if the message is designated as an error or a warning.

Parameters

args	Specifies the format argument value to print. *Data_type*: string, optional
-error	Specifies the message is an error. A prefix will be added. *Data_type*: bool, optional
formatString	Specify the format specifier like sprintf or Tcl's format command. *Data_type*: string, required
-help	Prints a brief description that includes the type and default information for each `print_message` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man print_message`.
-id *msgID*	Specifies the message id.
-warning	Specifies that the message is a warning. A prefix will be added. *Data_type*: bool, optional

Examples

The following commands generate an error and a message, which are included in the report_message output:

```
[DEV]innovus> print_message -error "A test %s." "from the user"
ERROR: (user): A test from the user.

innovus> print_message -warning "A test %s." "from the user"
WARN: (user): A test from the user.

innovus> print_message "A test %s." "from the user"
A test from the user.

innovus > report_message

*** Summary of all messages that are not suppressed in this session:
Severity      ID       Count          Summary
ERROR       no_id       1            A test %s.
ERROR       user        1            A test %s.
WARN        user        1            A test %s.
*** Message Summary: 1 warning(s), 2 error(s)
```

Related Topics

- report_message

Puts

```
Puts
[-help]
string
```

Outputs information to the screen (stdout) and Innovus log files (.log/.logv).

read_taf

```
read_taf
[-help]
[filename [-quiet]
```

Applies additional attribute data from Genus for the user-managed exchanges. It is not needed for managed exchanges after iSpatial (syn_opt -spatial) from Genus to Innovus or when using common-DB between Genus and Innovus. The 'taf' format is a private format between Genus and Innovus.

Parameters

`-help`	Prints a brief description that includes type and default information for each `read_taf` parameter.
filename	Specifies the name of file to read. *Data_type*: string, required
`-quiet`	When `-quite` is specified, the tool does not give a summary. *Data_type*: bool, optional

redirect

```
redirect
[-help]
[file_or_var_name]
[command]
[-tee]
[-stdin | -append]
[-stdin | -variable]
[-variable]
[-stderr | -stdin]
```

Redirects the output to a file or variable. You can also directly use redirect characters without explicit use of the redirect command for Innovus commands.

Any Tcl return value from *command* is returned by redirect. If redirect is used at the prompt, any echoing of the Tcl return at the prompt is not redirected.

You can also use the `redirect` command to write the contents directly to a gzip compressed file by ending the file name with .gz.

Parameters

`-help`	Prints a brief description that includes type and default information for each `redirect` parameter.
`file_or_var_name`	File or variable name for output to go. *Data_type*: string, optional
`command`	Command to be executed. *Data_type*: string, optional
`-append`	Appends stdout/stderr to file or variable. *Data_type*: bool, optional
`-stderr`	Redirects stderr. *Data_type*: bool, optional
`-stdin`	Redirects stdin. *Data_type*: bool, optional
`-tee`	Redirects output to both screen and file or variable. *Data_type*: bool, optional
`-variable`	Redirects to a Tcl variable. *Data_type*: bool, optional

It is also possible to use redirect characters similar to Unix usage, for Innovus commands, but not for built-in Tcl commands. This usage works for any Innovus command that does not explicitly register > or >> as options (if > or >> are visible in the man page or -help output for the command, it is explicitly registered). Note that the "source" command is overlaid by Innovus to add various verbose options, so it also supports these characters.

The table below shows the usage of redirect characters, and how to use & to indicate a Tcl var name.

Redirect Characters	Meaning
> <name>	Redirects stdout to the file <name>
>> <name>	Redirects stdout and appends to the file <name>

> &<name>	Redirects stdout to the Tcl var <name>
>> &<name>	Redirects stdout and appends to the Tcl var <name>

Examples

- Redirects the output to a new file timing.txt.
  ```
  redirect timing.txt "timeDesign -postRoute"
  ```
- Appends the output to the file test.out.gz in compressed gzip format.
  ```
  redirect test.out.gz "source test.tcl" -append
  ```
- Redirects the output to both screen and a file.
  ```
  redirect timing.txt "timeDesign -postRoute" -append -tee
  ```
- Redirects to the file a.log in compressed gzip format
  ```
  source test.out > a.log.gz
  ```
- Redirects and appends to the file a.log
  ```
  report_area >> a.log
  ```
- Redirects to the Tcl var a
  ```
  report_area > &a
  ```
- Redirects and appends to the Tcl var a
  ```
  report_area >> &a
  ```
- The `dbGet` and `get_property` commands return their values as TCL_RESULTS. To redirect the output to any file, you can use any of the following methods:
  a. You can redirect output of `dbGet` and `get_property` using the following commands:
  ```
  redirect {puts "[dbGet top.insts.name]"} > inst_name.rpt
  redirect {puts "[get_property [get_lib_cells F1] area]"} > property.rpt
  ```
  b. You can get the value of output stored in a variable using the following commands:
  ```
  redirect a {puts "[dbGet top.insts.name]"} -variable
  redirect b {puts "[get_property [get_lib_cells F1] area]"} -variable
  ```

rename_obj

```
  rename_obj
[-help]
[-escape_ok]
[-flexible]
inst|hInst|vCell|topCell|term|hTerm|hNet
new_name
```

Renames the `base_name` of a single design object, which could only be a `inst`, `hinst`, `design`, `module`, `port`, `hport`, or `hnet`. This command changes only the `base_name` of the specified objects, and cannot move those across the netlist hierarchy. This command also returns the new name of the renamed object.

The names used for SDC timing constraints can only be modified using this command, if they have been loaded into the memory. So, ensure that all the timing views are loaded using the `set_analysis_view` command before running the `rename_obj` command so that the SDC constraints are updated properly. The modified SDC files can be retrieved after renaming the objects.

The `rename_obj` command cannot update the names used inside a CPF `power_intent` file. This is because the CPF usage assumes that the CPF file is golden and should not be modified. To change the names used inside a CPF file, first update the CPF file manually, and then use the updated CPF file to run the `rename_obj` command.

An IEEE1801 `power_intent` file is allowed to be changed during the design flow. So, changing names using the `rename_obj` command will automatically update the IEEE1801 object names. You can use the `rename_obj` command to write out the new IEEE1801 file with the updated names.

Parameters

`-help`	Provides a brief description of the command that includes the type and default information for its parameters. For a detailed description of the command and all its parameters, use the man command: `man rename_obj`
`-escape_ok`	Allows `new_name` to have either the hierarchy chars '`/`' or the bus-bit chars '`[]`' in it, which will automatically be escaped. If this parameter is not specified, any set of '`/`' or '`[]`' chars in `new_name` will cause an error and the object will not be renamed. *Data_type*: bool, optional

`-flexible`	If `new_name` coincides with an existing name, this parameter appends a suffix (such as `_1` and `_2`) to differentiate it. If this parameter is not specified, a name collision in such a scenario causes an error, and the specified object is not renamed. *Data_type*: bool, optional
`inst|hInst|vCell|topCell|term|hTerm|hNet`	Specifies the object to be renamed. The object here must be an `inst`, `hinst`, design, `module`, `port`, `hport`, or `hnet`. If *`object`* is a `port` or `hport`, any `hnet` connected to it with the same `base_name` is also renamed to keep it matched (for example, renaming `hport:top/i1/clkin` also renames `hnet:top/i1/clkin`). If *`object`* is an `hnet` that is connected to a `port` or `hport` with the same `base_name`, an error occurs. In such a case, you must change the `port` or `hport` name to proceed.

	If an `hnet` name matches with its associated `net` name (for example, `get_db $my_hnet .net`), then the net name is also renamed on using the `rename_obj` command. For example, renaming `hnet:top/net1` also renames `net:top/net1`. Therefore, to rename a `net`, you need to rename the `hnet` with the same name. This command does not allow renaming a bus-bit object. So any `port`, `hport`, or `hnet` that has a `.base_name` like `busA[0]` (a bus-bit object), cannot be renamed, While a `.base_name` with a scalar name (like `busA\[0\]`) can be changed. *Data_type*: (`inst | hinst | module | design | port | hport | hnet`), required
new_name	Specifies the new `base_name` for the specified object. *Data_type*: string, optional

Examples

- The following command renames an `inst base_name` to `i2_new`:

```
rename_obj inst:top/i1/i2 i2_new
inst:top/i1/i2_new                #returned object with new name
```

- The following command renames an `inst base_name i2\/i3` with escaped hierarchy:

```
rename_obj {inst:top/i1/i2\/i3} i2/i3_new -escape_ok
inst:top/i1/i2\/i3_new            #returned inst object, no hierarchy change
```

- The following command renames a scalar `hport` name to remove escaped bus-bit chars:

```
rename_obj {hport:top/i1/busA\[0\]} busA_0
hport:top/i1/busA_0               #returned hport object
```

  Note: `hnet:top/i1/busA\[0\]` is also renamed to `hnet:top/i1/busA_0`.

- The following command renames a `port` name:

```
rename_obj port:top/clkin clkin_new
port:top/i1/clkin_new             #returned port object
```

  Note: Both `hnet:top/i1/clkin` and `net:top/i1/clkin` are renamed.

Related Information

`update_names`

report_area

```
report_area
[-help]
[-detail]
[-hierarchical_instance hinst_name]
[-include_physical]
[-min_area area_per_module]
[-min_count instance_count]
[-out_file filename]
[-show_leaf_cells]
[-show_msv_cells]
[-sort_by {name count area}]
[-table_style {horizontal vertical}]
[-summary | -depth depth_of_hierarchy]
```

Reports the combined standard cell area in each of the hierarchy modules and the top-level design. Also reports the cell area based on different cell types if the `-detail` option is specified. The command provides breakdown based on the cell type (such as .is_* attributes). The report represents the design hierarchy, and therefore, provides better readability.

Note: The units used in the report depend on the units used in the library. The area for each module is calculated from all the standard cells within each module using the LEF information.

Parameters

`-help`	Prints a brief description that includes type and default information for each `report_area` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man report_area`
`-depth` *depth_of_hierarchy*	Specifies the depth of hierarchy, all levels if not specified; the top of the hierarchy (design) is 1. *Data_type*: int, optional

`-detail`	Report the area in different cell type (buffer, inverter, combinational, flop, latch, clock_gate, macro, physical). *Data_type*: bool, optional
`-hierarchical_instance` *hinst_name*	Reports the area of the leaf instances in the specified hierarchical instance. You can use the -depth option to control the analysis depth of the specified hierarchical instance. *Data_type*: (hinst), optional
`-include_physical`	Specifies to include physical cells in the area calculation and report. By default, it reports only logical cells. *Data_type*: bool, optional
`-min_count` *instance_count*	Specifies the min instance count per module. The generated output will report the area of hinsts with number of instances greater than the specified `min_count value`. *Default*: `0` *Data_type*: float, optional
`-` `min_area` *area_per_module*	Specifies the min area per module. The generated output will report the area of hinsts with area greater than the specified min_area lib_units. *Default*: `0` *Data_type*: int, optional
`-out_file` *filename*	Specifies the name of the output file. *Data_type*: string, optional

`-show_leaf_cells`	Specifies to include the leaf cells at the design level and each hinst level. These are the instances whose parent is the hinst display. *Default*: `0` (Shows the hinst children in the report) *Data_type*: bool, optional
`-show_msv_cells`	Includes multiple supply voltage cells in the report. This option works with "`-table_style vertical`"
`-sort_by {name count area}`	Specifies the order of hinst names. *Default*: `name` *Data_type*: bool, optional
`-table_style {horizontal vertical}`	Specifies whether the base report should be expanded in the vertical or horizontal direction. *Default*: `horizontal` *Data_type*: enum, optional
`-summary`	It will print the area summary for the design. It will be equivalent as doing "`-depth 0`". *Data_type*: bool, optional

Examples

The following command shows the standard cell area in different base classes.

```
report_area -detail
```

Hinst Name	Module Name	Inst Count	Total Area	Combinational	Buffer	Inverter	Flop	Latch	Clock-Gate	Macro
dtmf_recvr_core		4283	37949.153	5223.91	9.526	262.836	2535.221	0.000	0.000	0.000

report_command_mode

```
report_command_mode
[-help]
[-filter list_of_commands]
{-non_default | -user}
```

Reports the *Mode options that do not match the default value or the options that have been manually set.

Parameters

`-help`	Prints a brief description that includes type and default information for each `report_command_mode` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man report_command_mode`
`-filter` *list_of_commands*	Specifies the commands that will be reported by `report_command_mode`. *Data_type*: string, optional
`-non_default`	Reports all the *Mode options that do not match the default value. *Data_type*: bool, optional
`-user`	Reports all the *Mode options that have been manually set. *Data_type*: bool, optional

Examples

- The following command displays the mode options that do not match the default value for all the commands:

  ```
  report_command_mode -non_default
  ```

  Output:

  ```
  setDesignMode -topRoutingLayer 6
  setDesignMode -process 40
  setDelayCalMode -enable_high_fanout true
  ```

- The following command displays the mode options that do not match the default value for the `setNanoRouteMode` command:

  ```
  report_command_mode -non_default -filter setDesignMode
  ```

  Output:

  ```
  setDesignMode -topRoutingLayer 6
  ```

- The following command displays the mode options that do not match the default value for the `setDesignMode` command:

  ```
  report_command_mode -non_default -filter {setDesignMode}
  ```

  Output:

  ```
  setDesignMode -topRoutingLayer 6
  ```

report_disk

```
report_disk
[-help]
[-dir directory_name]
```

Reports the disk metrics of the current working directory and the /tmp directory. The output of this command allows you to investigate Mb/sec throughput of the disk and disk I/O requirements.

This command also reports the used and free disk space for the directory specified by the `-dir` parameter (default is /tmp).

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_disk` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_disk`.
`-dir` *`directory_name`*	Specifies the name of the directory in which disk metric information is written. The default directory is `/tmp`.

Examples

- The following is a sample output for `report_disk`:

```
>report_disk

DISK_INFO : 206.66 Mb/S   381G total   1.1G used   359G free   /env(TMPDIR)

{206.66 381G 1.1G 359G}
```

- The following command shows the usage of `report_disk -dir`:

```
>report_disk -dir .

DISK_INFO : 98.51 Mb/S   9.6T total   9.3T used   395G free   .

{98.51 9.6T 9.3T 395G}
```

report_hidden_usage

```
report_hidden_usage
in_files
```

Reports a summary of all the hidden application Tcl globals and mode options in the specified files. Hidden globals and mode options are normally used for temporary fixes or early access, and often disappear or change in a new release. This command will help to find out the hidden settings used in existing scripts that might not be needed in the new release.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_hidden_usage` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_hidden_usage`
in_files	Specifies input files to search for hidden usage. *Data_type*: string, required

Examples

- The following command reports the hidden settings in the floorplan.tcl and place.tcl files.

```
>report_hidden_usage {floorplan.tcl place.tcl} > hidden.rpt

#########################################################################

#  Generated by:    Cadence Innovus 18.10-a072_1

report_message

```
report_message
[-help]
[[{-errors | -warnings | -all } [-count ]] | -suppressed ] [[-prefix prefix [-detail ]
[-summary ]] ]
[-detail | -count | -suppressed ] [-summary | -count | -suppressed ]
```

Reports the messages that have been issued since the tool was launched. When you run `report_message` without any argument, it prints a summary table and returns no Tcl value. However, when you provide an argument, it returns a list a of message IDs and does not print a table.

Parameters

`-help`	Prints a brief description that includes type and default information for each `report_message` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man report_message`
`-all`	Returns a list of all issued message IDs as a Tcl result. The result does not include suppressed message IDs. *Data_type*: bool, optional
`-count`	Returns the count of every message when `-errors`, `-warnings`, or `-all` is specified. For example, if an error appeared 20 times, command will return: `{<Error ID> 20}` *Data_type*: bool, optional
`-detail`	Returns a list of detail message of the specified prefix. *Data_type*: bool, optional
`-errors`	Returns a list of issued error message IDs as a Tcl result. *Data_type*: bool, optional
`-prefix` *prefix*	Returns a list of issued error message IDs matched with `-prefix` specified as a Tcl result. *Data_type*: string, optional
`-summary`	Returns the summary of the message that has the specified prefix. *Data_type*: bool, optional
`-suppressed`	Returns a list of suppressed message IDs as a Tcl result. *Data_type*: bool, optional
`-warnings`	Returns a list of issued warning message IDs as a Tcl result. *Data_type*: bool, optional

Examples

- The following command prints a summary table and returns no Tcl value.

```
report_message
```

Output:

```

reportDanglingPort

```
reportDanglingPort
-help
[-ptn]
-outfile fileName
```

Reports ports that are disconnected from both the inside and outside of a module, and ports that are connected within the module but disconnected outside the module.

Note: If the design has some dangling or unconnected ports, Innovus will add `FE_UNCONNECTED_*` nets for these dangling or unconnected ports in the design during optimization. You can report these dangling ports using the `reportDanglingPort` command.

Parameters

`-help`	Prints a brief description that includes type and default information for each `reportDanglingPort` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reportDanglingPort`
`-outfile`	Specifies the name of the report generated by this command. *Data_type*: string, required
`-ptn`	Specifies a partition only flag. *Data_type*: bool, optional

Example

The following command writes information on dangling reports to file `myreport`:

```
reportDanglingPort -outfile myreport
```

Related Information

- `deleteDanglingPort`
- `disconnectDanglingPort`

reportGateCount

```
reportGateCount
[-help]
[-hinst hinst_name]
[-level level]
[-limit gateCount]
[-stdCellOnly]
[-outfile fileName]
```

Reports the size of the imported design, measured in gate counts.

The software calculates the gate count for a module using the following equation:

```
gateCount = moduleArea / gateSize
```

Where:

- `moduleArea` is the area of the module. By default, this is the sum of the areas of all instances inside of the module, including standard cells, blocks, and I/O cells. If you specify the `-stdCellOnly` parameter, `moduleArea` is the sum of the areas of the standard cells inside the module only.
- `gateSize` is calculated as follows:

  ```
  gateSize = dbgStdCellHgt x dbgDBUPerIGU x dbgSitesPerGate
  ```

  Where:

  - `dbgStdCellHgt` is the standard cell row height.
  - `dbgDBUPerIGU` is the *M2* layer pitch.
  - `dbgSitesPerGate` is a user-defined global variable that determines the gate size the software assumes when calculating the gate count. For example, the default value of `3` means the assumed the gate size is equal to 1 standard cell row height and 3 *M2* layer pitch widths. You can change this value to adjust the assumed gate size for each specific design.

You can use the `reportGateCount` command after importing the design.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reportGateCount` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man reportGateCount`.
`-level` *level*	Expands the module to the specified level. For example, if you specify `1`, CTS expands the specified module by one level. The gate counts of all "children" modules of the module that satisfy the `-limit` parameter are included in the gate count report. If you specify `2`, CTS expands the module by two levels. The gate counts of all "children" and "grandchildren" modules of the module are included in the gate count report. *Default*: Module is not expanded, and CTS reports only the gate count of the module itself. (This is equivalent to specifying a level of `0`.) *Data_type*: int, optional
`-limit` *gateCount*	Instructs CTS to ignore modules with gate counts below the specified limit. Such modules are ignored during expansion and reporting. *Default*: CTS ignores modules with 1000 or fewer gates during expansion and reporting. *Data_type*: int, optional
`-hinst` *hinst_name*	Specifies the hierarchical instance for which to generate a gate count report. *Default*: Generates a gate count report for the hierarchical instance corresponding to the top cell of the design. *Data_type*: string, optional
`-outfile` *fileName*	Writes out the gate count report to the specified file name. The default file extension is `.gateCount`. *Default*: Displays the gate count report *only* in the Innovus console. *Data_type*: string, optional
`-stdCellOnly`	Calculates gate count based only on standard cells within the specified module. Blocks and I/O cells within the module are ignored. *Data_type*: bool, optional

reportNetStat

```
reportNetStat
```

Reports statistical data of the design netlist such as number of cells, number of nets (including tri-nets and degen nets), number of pins, and number of IOs in the design and number nets with different number of terms. The primitives used in the design are also listed.

Example

```
*** Statistics for net list DTMF_CHIP ***
Number of cells      = 4263
Number of nets       = 4551
Number of tri-nets   = 0
Number of degen nets = 21
Number of pins       = 16490
Number of i/os       = 57

Number of nets with    1 terms = 21 (0.5%)
Number of nets with    2 terms = 2510 (55.2%)
Number of nets with    3 terms = 771 (16.9%)
Number of nets with    4 terms = 510 (11.2%)
Number of nets with    5 terms = 223 (4.9%)
Number of nets with    6 terms = 108 (2.4%)
Number of nets with    7 terms = 76 (1.7%)
Number of nets with    8 terms = 46 (1.0%)
Number of nets with    9 terms = 30 (0.7%)
Number of nets with >=10 terms = 256 (5.6%)

```

resume

```
resume [-help]
```

Resumes a suspended script from the point where it had stopped.

Use the `suspend` and `resume` commands to debug your scripts interactively. The `suspend` command stops a script and restores access to the Innovus prompt. You can then type any command required for debugging. Whenever you want to resume the suspended script, type `resume` at the Innovus prompt.

Parameters

`-help`	Prints the usage of the `resume` command. For a detailed description of the command, use the `man` command: `man resume`.

Related Information

- `suspend`
- "Interrupting the Software" section of the Getting Started chapter in the *Innovus User Guide*

savePreference

```
savePreference
[-help]
[-include_window_font]
{[-directory {home current} | -file_name PreferenceFileName]}
```

Saves the preference file.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `savePreference` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man savePreference`.
`-directory {home current}`	Specifies the directory path.
`-file_name PreferenceFileName`	Specifies the saved filename.
`-include_window_font`	Specifies the window and font settings.

Related Information

- `getPreference`
- `setPreference`
- For more information on setting preferences from the GUI, see Set Preference form in the View Menu chapter in the *Innovus Menu Reference*.

select_obj

```
select_obj
[-help]
<any_object>+
```

Selects the object or the list of objects for putting into a set. The object type can be any object type selectable on the GUI such as inst and net.

You can add a new selection to an already selected object using the following command:

```
select_obj [concat [dbGet selected.] new_object_pointer]
```

Parameters

`-help`	Prints a brief description that includes type and default information for each `select_obj` parameter. For a detailed description of the command and all of its parameters, use the man command: `man select_obj`
`<any_object+`	Specifies the list of objects. **Note:** If the list contains the objects that cannot be selected, such as `head`, `layer`, and `ptn`, `select_obj` will not select them. The objects that cannot be selected are `head`, `layer`, `ptn`, `fPlan`, `prop`, `bus`, `vCell`, `viaRuleGenerate`, `layerRule`, `foreign`, `hNet`, `site`, `densityShape`, `shape`, `rackDef`, and `gCellGridDef`. *Data_type*: (any_object)+, required

Example

```
select_obj [dbGet -p top.insts.name i1]
```

Related Topics

- `deselect_obj`

selectObjByProp

```
selectObjByProp
[-help]
{Instance Pin Net Module InstanceGroup Bump}
expression
```

Logs the select operations performed through the Find/Select Object form (*View -- Find/Select Object*).

Parameters

`-help`	Outputs a brief description that includes type and default information for each `selectObjByProp` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man selectObjByProp`.
`{Instance Pin Net Module InstanceGroup Bump}`	
	Specifies the name of the object(s) on which the select operation is performed. *Data_type*: enum, required
expression	Specifies the selection criteria specified through the Find/Select Object form. *Data_type*: string, required

Examples

- The following command logs the select operation for all instances of type BLOCK in the *View - Find/Select Objects* form. In this case, the value of the Mode field was set to *Single* in the *Find/Select Objects* form.

  ```
  selectObjByProp Instance <Type>=<Block>
  ```

- The following command logs the select operation for all I/O pins that are on the layer Metal2 and whose status is not *placed*. In this case, the value of the Mode field was set to *And* in the *Find/Select Objects* form.

  ```
  selectObjByProp Pin {And(<Type>=<I/O Pin>,!<Status>=<Placed><layer>=<Metal2>)}
  ```

- The following command logs the select operation for all modules whose constraint type is Fence or Region. In this case, the value of the Mode field was set to *OR* in the *Find/Select*

Objects form.

```
selectObjByProp Module {OR(<Constraint Type>=<Fence>,<Constraint Type>=<Region>)}
```

- The following command logs the select operation for all pins of the modules DTMF_INST/TDSP_CORE_INST and DTMF_INST/ARB_INST that are on the top side and have a status of *placed*, *fixed*, or *cover.* In this case, the value of the Mode field was set to *Multiple* in the Find/Select Objects form.

```
selectObjByProp Pin And(And(!<Status>=<Unplaced>,<Side=
<Top>),OR(<Module>Match<DTMF_INST/TDSP_CORE_INST>,
<Module>Match<DTMF_INST/ARB_INST>))
```

Related Topics

- For information on *Find/Select Objects* form, see "Find/Select Object" in the View Menu chapter of the *Innovus Menu Reference*.

set_global_always_keep

```
set_global_always_keep
[-help]
variableName
```

Saves the specified UDM variable to the .global file.

Parameters

`-help`	Prints a brief description that includes type and default information for each `set_global_always_keep` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_global_always_keep`
`variableName`	Specifies the variable name. *Data_type*: string, required

Example

The following command will save the UDM variable `timing_disable_internal_inout_cell_paths` with the value saved by the user:

```
> set_global_always_keep timing_disable_internal_inout_cell_paths
```

Then, after `saveDesign`, the following line will appear the in the `.global` file:

```
set_global timing_disable_internal_inout_cell_paths true
```

Related Information

- `saveDesign`

set_message

```
set_message
-help
-id <list_of_msg_ids>
[-severity {warn error info reset} | -limit <number> | -no_limit | -suppress | -
unsuppress | -on_error {msg_only exit stop_script | -stop_script_limit limitNumber}]
```

Specifies to change the message severity levels, `INFO, WARNING` or `ERROR`, at the beginning of the message. This command allows you to control the messages that are displayed for a particular design. For example, if there are some warnings that are critical for the design, you can change the message severity to `ERROR`. Similarly, if there are messages that you want to ignore, you can change the message severity to `INFO`.

An example of an ERROR message is:

**ERROR: (GLOBAL-105): Unknown global 'timing_enable_socv_analysis' specified.

All ERROR and WARN message begin with a header like:

**ERROR: (<msg_id>):

**WARN: (<msg_id>):

The <msg_id> format is: <prefix>-<num> ("GLOBAL" is the prefix, and "105" is the num in the example above).

You can use the msg_id to change how that specific message is handled using the options below.

Parameters

-help	Outputs a brief description that includes type and default information for each `set_message` parameter.
`-id` *list_of_msg_ids*	Specifies the list of message IDs that require a change. If you do not specify any message IDs, the change is applied to all message IDs. *Data_type*: string, optional

`-limit` *`number`*	Sets the message limit to *`number`* per every public command. The default limit is 20, so any specific message will be written out 20 times for one command and then further output of that message will be disabled (along with an additional message saying the message limit has been exceeded). If the number is set to 0, the message will be completely suppressed for the next public command that triggers the message. You can unsuppress the message by setting the number greater than 0. *Data_type*: int, optional
`-no_limit`	Removes any existing limit on the selected messages. **Note:** Suppressed messages remain suppressed until the `-unsuppress` option is applied. *Data_type*: bool, optional
`-on_error {msg_only exit stop_script}`	Specifies an extra action for error messages (not for warn or info messages). If no message is specified, the action applies to all error messages. • `msg_only`: Prints error message only, and the command proceeds as it normally would. This is the default. • `exit`: Exits immediately and returns to Linux. • `stop_script`: Waits for the current Tcl command to finish, then stops executing any Tcl script, and returns to the interactive Tcl prompt. Note, if a message severity is changed from error to either warn or info, it will no longer trigger this extra action. *Data_type*: enum, optional

`-severity {warn error info reset}`	Specifies the new severity level for the message being modified. The `reset` argument sets the message severity back to its original state. Normal INFO messages do not have a message ID, but if a warn or error message severity is changed to info, the INFO message will include the message ID in the message header. For example, the INFO header might look like: INFO: (MSG-123): ... *Data_type*: enum, optional
`-stop_script_limit` *limitNumber*	Sets the message limit per every public command. If you set `-stop_script_limit 10`, at the 10th time the message being triggered for one command, the tool will wait for current Tcl command to finish, then stop executing any Tcl script, and return to the interactive Tcl prompt. The default value is `-1`, which is unlimited. *Data_type*: int, optional
`-suppress`	Suppresses the message completely. There is no warning about exceeding message limits given. *Data_type*: bool, optional
`-unsuppress`	Unsuppresses the message. *Data_type*: bool, optional

Examples

- The following command changes two messages from `ERROR` to `WARN`:
  ```
  set_message -id {IMPLF-81 ENCLF-95} -severity warn
  ```
- The following command returns all messages to their original severity:
  ```
  set_message -severity reset
  ```
- The following command resets the specified message to its original severity:
  ```
  set_message -id IMPLF-81 -severity reset
  ```

Related Topics

- `setMessageLimit` command
- `get_message` command

set_proc_verbose

```
set_proc_verbose
[-help]
{[procedure_name [-quiet ]] | [-report ]}
```

Makes a procedure verbose, when the procedure is called for execution.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_proc_verbose` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_proc_verbose`.
procedure_name	Specifies the name of the procedure to be made verbose. *Data_type*: string, required
`-quiet`	Reverts the procedure back from being verbose. *Data_type*: bool, optional
`-report`	Reports procedures that are verbose. *Data_type*: bool, optional

Examples

- The following commands show the usage of the `set_proc_verbose` command and its options for the `fplan_boxes` procedure.

  The code within the `fplan_boxes` procedure is given below:

  ```
  innovus 1> proc fplan_boxes {} {
  + puts "Floor Plan Boxes:"
  + puts [dbGet top.fplan.boxes]
  + }
  ```

The following command executes the `fplan_boxes` procedure. Please note that the execution result simply shows the coordinates of the floor plan boxes.

```
innovus 2> fplan_boxes

Floor Plan Boxes:

{{0.0 0.0 1511.96 1512.12}}
```

The following commands makes the `fplan_boxes` procedure verbose:

```
innovus 3> set_proc_verbose fplan_boxes

fplan_boxes
```

After the `fplan_boxes` procedure is made verbose and is executed, the code of the `fplan_boxes` procedure is displayed:

```
innovus 5> fplan_boxes

#@ Begin verbose proc fplan_boxes

@proc(fplan_boxes) 1: puts "Floor Plan Boxes:"

Floor Plan Boxes:

@proc(fplan_boxes) 2: dbGet top.fplan.boxes

@proc(fplan_boxes) 3: puts [dbGet top.fplan.boxes]

{{0.0 0.0 1511.96 1512.12}}

#@ End verbose proc fplan_boxes
```

You can use the `-report` option to see the verbose procedures:

```
innovus 7> set_proc_verbose -report

innovus 8> fplan_boxes
```

If you have made your procedure verbose and now you want to make it non-verbose, you can use the `-quite` option. The command below makes the `fplan_boxes` procedure non-verbose:

```
innovus 6> set_proc_verbose fplan_boxes -quiet

fplan_boxes
```

setCheckMode

```
setCheckMode
[-help]
[-reset]
[-all {true | false}]
[-checkIlm {true | false}]
[-extraction {true | false}]
[-floorplan {true | false}]
[-globalNet {true | false}]
[-integrity {true | false}]
[-io {true | false}]
[-library {true | false}]
[-mgrid {true | false}]
[-netlist {true | false}]
[-placement {true | false}]
[-route {true | false}]
[-sroute {true | false}]
[-tapeOut {true | false}]
[-timingGraph {true | false}]
[-vcellnetlist {true | false}]
```

Sets the data checks that the software performs.

If the software finds missing or incorrect data during the check, it

- Does not proceed with the functionality that would be affected by the incomplete or incorrect data
- Generates an error message in the Innovus console

Use the `getCheckMode` command to display the current settings for the `setCheckMode` command.

Use the `setCheckMode` command immediately before importing the design, or before performing a functionality.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setCheckMode` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setCheckMode`.
`-all {true | false}`	Performs all data checks. *Default*: `false` *Data_type*: bool, optional
`-checkIlm {true | false}`	Checks if no instances are inserted inside an ILM and whether the ILM boundary nets are consistent between flattened and unflattened states. *Default:* `false` *Data_type*: bool, optional
`-extraction {true | false}`	Checks that all data required for extraction are correct. **Note:** Although this parameter instructs the Innovus software to check that routing is complete, this parameter does *not* check wiring for DRC violations. *Default*: `false` *Data_type*: bool, optional
`-floorplan {true | false}`	Checks the floorplan. *Default:* `false` *Data_type*: bool, optional
`-globalNet {true | false}`	Checks instance pin and power/ground pin net connections. *Default:* `false` *Data_type*: bool, optional
`-integrity {true | false}`	Checks integrity. *Default:* `false` *Data_type*: bool, optional

`-io {true | false}`	Checks the I/O pads. *Default:* `false` *Data_type*: bool, optional
`-library {true | false}`	Checks the physical (LEF) and timing libraries. *Default:* `false` *Data_type*: bool, optional
`-mgrid {true | false}`	Checks that geometries are on the manufacturing grid. **Note:** The software does not stop this check, even if there are problems in the DEF file. The software generates an error message if it finds any problems in the DEF file. *Default:* `false` *Data_type*: bool, optional
`-netlist {true | false}`	Checks the netlist. *Default:* `false` *Data_type*: bool, optional
`-placement {true | false}`	Checks the placement of the design. *Default:* `false` *Data_type*: bool, optional
`-reset`	Resets parameters to their default values. The `-reset` parameter *must* be the first parameter specified. If you specify `-reset` by itself, the software resets all `setCheckMode` parameters to their default values. If you specify parameters after `-reset`, the software resets only those parameters to their default values. Any values that do not already match the default value and are reset will be reported. *Data_type*: bool, optional

`-route {true | false}`	Checks whether power and ground pins are connected to power and ground nets before power routing. The software also checks whether all tie high and tie low pins are connected to global power and ground nets before detailed routing. *Default*: `false` *Data_type*: bool, optional
`-sroute {true | false}`	Checks special routes. *Default:* `false` *Data_type*: bool, optional
`-tapeOut {true | false}`	Runs the software in tapeout mode instead of in protyping mode. In tapeout mode, the software stops running if it detects errors that would seriously affect the overall integrity of results. In prototyping mode, the software does not stop if it detects such errors. *Default:* `false` *Data_type*: bool, optional
`-timingGraph {true | false}`	Checks library cells for timing information. *Default:* `false` *Data_type*: bool, optional
`-vcellnetlist {true | false}`	Checks for tie-high and tie-low output pins when reading the Verilog netlist. The software stops the flow if tie-high or tie-low output pins are found because connecting an output signal pin to a power or ground creates a potential short circuit. If all of the tie-high or tie-low output pins are actually the driver pins for power or ground nets, specify `-vcellnetlist false`, so that the flow can continue. **Note:** To turn off the checking, you *must* set this parameter before initializing the design. *Default:* `true` *Data_type*: bool, optional

Examples

- The following command turns on all data-checking modes except the pre-power-routing data checking:

  ```
  setCheckMode -all true -route false
  ```

- The following command checks a DEF file for objects that are off the manufacturing grid.

  ```
  setCheckMode -mgrid true
  ```

  The software generates error messages such as the following:

  ```
  **ERROR: Line 56: OffMGrid: Track start value (566) is not on Manufacturing Grid.

  **ERROR: Line 446: OffMGrid: Via (-10000, -10000) (10006, 10006) named via3Array_1
  is not on Manufacturing Grid.

  **ERROR: Line 902: OffMGrid: Component location (130686, 171366) of inst
  iblockN20/iregNS/yi_reg_1 is not on Manufacturing Grid.
  ```

- The following command resets the `-mgrid` parameter to its default value:

  ```
  setCheckMode -reset -mgrid
  ```

- The following command resets all `setCheckMode` parameters to their default values:

  ```
  setCheckMode -reset
  ```

Related Topics

- `getCheckMode`

setCompressLevel

`setCompressLevel` *value*

Specifies the compression level to use when compressing large data files. A higher compression level creates a more compressed file, but at the cost of speed. A lower compression level creates a less compressed file, but speeds up the process. By default, the software uses the `gzip` default value, that is 6, which results in high compression at the cost of speed.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setCompressLevel` parameter. For a detailed description of the command and all of its parameters, use the man command: man `setCompressLevel`
value	Specifies the compression level to use when compressing files. You can specify -1 or values between 1 and 9, where: `1` Creates the least compressed files at the highest speed. `9` Creates the most compressed files at the lowest speed. -1 Returns to the `gzip` default value, that is 6 (`Z_DEFAULT_COMPRESSION`). *Data_type*: int, required

Examples

- The following command sets the highest compression level and results in the most compressed data:
  ```
  setCompressLevel 9
  ```
- The following command resets the compression level to the gzip default, that is 6.
  ```
  setCompressLevel -1
  ```

Related Topics

- `getCompressLevel`

setLayerPreference

```
setLayerPreference
[-help]
layer_name
[-isVisible {1 | 0}]
[-isSelectable {1 | 0}]
[-color {color_name | color_value}]
[-lineWidth {lw}]
[-stipple stipple_name | -stippleData width height "stipple_data"]
```

Sets a new preference for the specified object or layer.

See `getLayerPreference` for descriptions of how to display layer preferences.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setLayerPreference` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setLayerPreference`
`-color`	Specifies a color for the object. Specify either a color name or a numeric RGB value. *Date_type*: string, optional
`-isSelectable`	Specifies whether the object is selectable. Specify `1` to make the object selectable. Specify `0` to make the object non-selectable. *Date_type*: enum, optional

`-isVisible`	Specifies whether the object is visible. Specify `1` to make the object visible. Specify `0` to make the object invisible.
	Examples
	• You can turn off the visibility of all custom layers by using the following command:
	`setLayerPreference customLayers -isVisible 0`
	• You can turn off display of flightlines by using the following command:
	`setLayerPreference flightLine -isVisible 0`
	Date_type: enum, optional

layer_name	Specifies the name of the layer or the object type. The valid layer names are: • layer number • `#AVio`, `#Cont`, `#ContPin`, `#ContRB`, `#Pin`, `#RB`, `#RTrk`, `#Track`, and `M#Vio`, where `#` is the number representing layer. • `MGroup*` for controlling preference for by group, where * represents a group such as Pin or Track. The valid object types are `blackBox`, `block`, `blockHalo`, `bump`, `bump1`, `bump2`, `bump3`, `cellBlkgObj`, `channel`, `clkTree`, `congest`, `congestH`, `congestObj`, `congestV`, `datapath`, `fence`, `gcellOvflow`, `guide`, `hinst`, `inst`, `ioSlot`, `ioRow`, `macroSitePattern`, `metalFill`, `mGrid`, `net`, `netRect`, `nonPrefTrackObj`, `obstruct`, `pinObj`, `pinText`, `power`, `powerNet`, `ptnFeed`, `ptnPinBlk`, `pwrdm`, `pwrdm1`, `pwrdm2`, `pwrdm3`, `layerBlk`, `region`, `routeGuide`, `ruler`, `screen`, `select`, `sitePattern`, `stdRow`, `term`, `text`, `trackObj`, `userGrid`, and `violation`.
`-lineWidth`	Specifies the number of pixels in the border of the specified object. Specify this value as integer. *Date_type*: int, optional

`-stipple`	Specifies information about the stipple pattern of the object. The valid stipple names are `None`, `Horizontal`, `Vertical`, `Grid`, `Slash`, `Backslash`, `Cross`, and `Brick`. *Date_type*: string, optional
`-stippleData`	Specifies the stipple information for the object. Specify this information in x-window bitmap format. *Date_type*: string, optional

Examples

- The following command sets a layer preference for the module object in green with dotted stipple pattern (8 by 4 bitmap with dot at every 4 pixels):
  ```
  setLayerPreference hinst -color green -stippleData 8 4 "0x00 0x11 0x00 0x00"
  ```
- The following command turns off the visibility of the track for Metal1:
  ```
  setLayerPreference Metal1Track -isVisible 0
  ```
- The following command turns on the selectability of the track for Metal1:
  ```
  setLayerPreference Metal1Track -isSelectable 1
  ```
- The following command turns off selectability for all tracks:
  ```
  setLayerPreference MetalGroupTrack -isSelectable 0
  ```

- `getLayerPreference`

setLicenseCheck

```
setLicenseCheck
[-help]
[-checkout lic]
[-default]
[-existOnServer]
[-optionList "lic1 lic2 ..."]
[-status]
[-wait time_in_minutes]
```

Manages licenses for product options. Specifies licenses to check out, license wait time, and the status of all product option licenses.

Note: This command does not manage multi-CPU licenses. For information on the commands that manage multi-CPU licenses, see the "*Multiple-CPU Processing Commands*" chapter.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setLicenseCheck` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setLicenseCheck`.
`-checkout lic`	Checks out the allowed optional license immediately. *Date_type*: string, optional
`-default`	Restores the default. values for this command. *Date_type*: bool, optional

`-existOnServer`	Prints out all licenses that exist on the license server. The following information is included for each license. • License name • Product number • Product name • License string • Version *Date_type*: bool, optional
`-optionList "`*`lic1 lic2 ...`*`"`	Specifies an ordered list to limit dynamic optional license check-out. Use `-status` to see legal names. Dynamic licenses are not checked out until they are needed. If you specify a license that is not allowed with your base license, or a license that is not available, the software does not check out that license and instead issues a warning message. If you specify more than one license, begin and end the option list with double quotation marks or braces. *Date_type*: string, optional
`-status`	Prints the current status of all licenses. The following information is included: • The name of the base license that is checked out • The current wait time • A list of the allowed license options • A list of the available license options • A list of the currently checked-out license options. *Date_type*: bool, optional
`-wait` *`time_in_minutes`*	Specifies the amount of time the system waits for a license to become available. If the license is available in less than the specified wait time, the system checks out the next needed license without waiting. *Default:* `0` (no wait time) *Value range:* `0` to `10,000` *Date_type*: int, optional

Examples

- The following command outputs a table that provides information about the licenses that exist on the license server:
  ```
  setLicenseCheck -existOnServer
  ```
  The system prints the following information:
  ```
  Name          Prod #    Product Name                          License string Version
  invs_hier     INVS40    Innovus Hierarchical Design Option    Innovus_Hier_Opt 15.1
  invs_ms       INVS30    Innovus Mixed Signal Option           Innovus_MS_Opt 15.1
  invs_3d_ic    INVS60    Innovus 3D-IC Option                  Innovus_3D_IC_Opt 15.1
  invs_20nm     INVS20    Innovus 20nm Option                   Innovus_20nm_Opt 15.1
  invs_10nm     INVS10    Innovus 10nm Option                   Innovus_10nm_Opt 15.1
  ..........................................................................
  ..........................................................................
  ```
- The following command specifies that licenses for Tempus-L and Tempus-XL may be checked out. Tempus-L licenses are checked out before Tempus-XL licenses.
  ```
  setLicenseCheck -optionList "tpsl tpsxl"
  ```
- The following command sets the wait time to 5 minutes:
  ```
  setLicenseCheck -wait 5
  ```

- Product and Licensing Information chapter in the *Innovus User Guide*
- Getting Started chapter in the *Innovus User Guide*

setLimitedAccessFeature

```
setLimitedAccessFeature
[-help]
variableName
1 | 0
```

Enables or disables a limited access feature.

The Innovus includes certain limited access features that showcase advanced technology integrated in the software. These features have been internally qualified at Cadence but have had only limited customer testing.

> Limited access features are enabled by a variable specified through the `setLimitedAccessFeature` command. To use these limited access features, contact your Cadence representative to qualify your usage and to make sure it meets your needs before deploying it widely.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setLimitedAccessFeature` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setLimitedAccessFeature`
variableName	Specifies the name of the variable that enables the limited access feature. *Data_type*: string, required
1 | 0	Specifying a value of `1` enables the feature. Specifying a value of `0` disables the feature. *Data_type*: bool, required

setMessageLimit

```
setMessageLimit
[-help]
numberToLimit
[prefix [ID1, ID2, ...]]
```

Limits error and warning messages to a specified number per unique ID. Any occurrences beyond the limit are suppressed. The default limit is 20 per message ID. The default limit is applicable only for `ERROR*` and `WARNING*` messages; there is no default limit for `verify*`, `check*`, and `INFO*` messages.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setMessageLimit` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setMessageLimit`.
`numberToLimit`	Limits error and warning messages to a specified number per unique ID. Any occurrences beyond the limit are suppressed. The default limit is 20 per message ID. The default limit is applicable only for ERROR* and WARNING* messages; there is no default limit for verify*, check* and INFO* messages. *Default*: 20 *Data_type*: int, required
`prefix [ID1, ID2, ...]`	Specifies the number per unique ID of specified prefix. *Data_type*: string, optional

Example

- The following command sets a limit of 10 messages per unique ID for all error and warning messages:
  ```
  setMessageLimit 10
  ```
- The following command sets a limit of 2 for the TCLCMD-917 error message.
  ```
  setMessageLimit 2 TCLCMD 917
  ```

After 2 occurences of TCLCMD-917, which is the same as the limit set, the system announces that the limit has been reached.

```
[DEV]innovus 4> set_propagated_clock CLK1

**ERROR: (TCLCMD-917): Cannot find 'ports, pins, or clocks' that match 'CLK1'

[DEV]innovus 5> set_propagated_clock CLK1

**ERROR: (TCLCMD-917): Cannot find 'ports, pins, or clocks' that match 'CLK1'

[DEV]innovus 6> set_propagated_clock CLK1

Message <TCLCMD-917> has exceeded the message display limit of '2'.
setMessageLimit/set_message_limit sets the limit.
unsetMessageLimit/unset_message_limit can be used to reset this.

Related Topics

- `set_message` command
- `get_message` command

setPreference

```
setPreference
[-help]
preference_name
value
```

Defines preferences, such as, commands issued during a session can be logged to a log or the screen.

When writing to a log and screen, the commands are preceded by <CMD>.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setPreference` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setPreference`.
`preference_name`	The name of the preference variable you want to set. To see a list of preferences, select ***View - Set Preference*** from the menu, then click *Save*. In the Save Preferences form, select the required save option and click *OK*. If you select the default *Save to Home Directory* option, the list of preferences and their values are saved in `.enc` file in your home directory. *Data_type*: string, required
`value`	The value for the preference. For example, the `CmdLogMode` preference has the following values. `0`--write to command only `1`--write to command and log (default) `2`--write to command, log, and screen *Data_type*: string, required

Preference Variables

The following table lists the preference variables you can set using the `setPreference` command and their GUI equivalent in the Preferences form:

Note: The following table might not be readable when viewed with the Unix man command. Check the `setPreference` command description in the *Innovus Text Command Reference* to view the table.

Variable Name	GUI Equivalent in Preferences Form	
	Tab Name	Option Name
`DesignName`	***Design***	*Design Name*
`DesignHierChar`		*Design Hierarchical Character*
`DEFHierChar`		*DEF Hierarchical Character*
`PDEFBusDelim`		*PDEF Bus Delimiter*
`CmdLogMode`		*Command Log Mode* ◦ *Command Only* ◦ *Command and Log* ◦ *Command, Log, and Screen*
`LogTypeInCmd`		*Log Type-In Command*
`logviewer`		*Invoke viewLog at Start Up*
`MouseGestures`		*Enable Mouse Gestures*

ShowFPObjInPlace	***Display***	*Show Floorplan Objects in Physical View*
ShowAllFence		*Show All Constraint*
DisplayPtnPin		*Display Partition Pin*
ShowAttrPopup		*Show Attributes Popup*
ShowUnplacedInst		*Display Unplaced Instances*
ShowRectilinearPad		*Show Rectilinear Pad Cell*
DisplayCellPin		*Display Instance Pin*
ShowLefLayerName		*Show Lef Layer Name*
AutoRedraw		*Auto-redraw after Layer Change*
EnlargeLogicalPin		*Enlarge Logical Pin In Fit View*
InstDisplayThreshold		*Instance Display Threshold*
WireDisplayThreshold		*Wire Display Threshold*
WireDisplayCheck2D		*Apply Threshold in 2D*
DrawInstanceByStatus		*Draw Instance by Placement Status*
DrawWireByStatus		*Draw Wire by Wire Status*
percentageOfPan		*Percentage of Window to Pan*
scaleOfZoom		*Scale of Zoom In/Out*
zoomPrevCount		*Number of Previous Zoom Saved*
MinFPModuleSize		*Min. Floorplan Module Size*
ShowParentModule		*Show Parent Module With Level*
ShowChildPartition		*Show Child Partition With Level*
ShowParentPartition		*Show Parent Partition With Level*

`AutoDetailDisplay`		*Automatic Detail Display for Large Design* ◦ Special Wire ◦ Regular Wire
`DetailDisplayFactor`		*Factor*
`DoubleClickTime`		*Double Click Time*
`DisplayRelFPlan`	***Edit***	*Honor Relative Floorplan Constraints*
`SingleLayerMode`		*Single Layer Mode For Routing Blockage, Ptn Pin Blockage and Ptn Feed*
`ShowDelBox`		*Show Delete Confirmation Box*
`StrecthRestriction`		*Box Stretch Restrictions* ◦ *No Restriction* ◦ *Maintain Area* ◦ *Maintain Aspect Ratio*
`StretchRectilinear`		*Rectilinear Stretch Restrictions* ◦ *No Restriction* ◦ *Maintain Area*
`MoveRestriction`		*Move Restrictions* ◦ *No Restrictions* ◦ *Orthogonal*
`clone_row_orientation_snapping`		*Clones snapping to same master row orientation*

SelectByArea	***Selection***	*Select by Area* ◦ *Enclosed by Box* ◦ *Intersecting Box*
SelectByLine		*Select by Line*
SelectStickyMode		*Sticky Mode*
SelectNetWhenSelectPin		*Hilite Net When Selecting a Pin*
HiliteNetWhenQueryObj		*Hilite Nets When Querying an Instance*
HiliteShapeWhenSelectNet		*Hilite Pin Shapes When Selecting a Net*
QueryWireNet		*Query Nets When Wires are Selected*
QuerySkipInst		*Skip Objects by Auto Query* ◦ *Cell*
QuerySkipInstObs		◦ *Obs in Cell*
QuerySkipInstPin		◦ *Pin in Cell*
QuerySkipRegular		◦ *Regular Wire*
QuerySkipSpecial		◦ *Special Wire*
WinSelectMargin		*Window Select Margin*
HighlightColorNumber		*Number of Highlight Color*
MinFlightLineWidth	***Flightline***	*Minimum Flightline Width*
MaxFlightLineNetTerms		*Maximum Flightline Net Terms*
DisplayPlaceFlightLine		*Show Flightline In Physical View*
ShowNumberBlockConnection		*Show Number of Connections For Block*
FlightLineInMove		*Draw Flightline When Moving Instance(s)*
ShowConnectionInOutNumber		*Show Input/Output Connection Number*

ShowFlightLineTermMark	*Show Pin's Input/Output Mark*
ShowBothInputConnection	*Show Both Input Pins Connection*
ShowNetWeightConnection	*Show Connection With Netweight 0*
ShowFlightLineThruPtnPin	*Show Flightlines Through Partition Pins*
noInsideMacro	*Don't Show Flightline to Inside Macro*
SkipBufferFlightline	*Skip Buffer/Invert Cell*
NoClockFlightline	*Don't Show Clock Net*
OnlyClockFlightline	*Show Clock Net Only*
DrawFlightlineLast	*Draw Flightline on Top of Selection*
OnlyBundleNetFlight	*Only Show Net Bundle Flight Line*
ExclusiveFlight	*Show Connection Only Between Selected Objects*
ConnectionColorType	*Single Color* *Different Color by Type of Connections* *Different Color by Number of Connections*
InputConnectionColor	• *Different Color by Type of Connections: Input* • *Different Color by Number of Connections: Small*
OutputConnectionColor	• *Different Color by Type of Connections: Output* • *Different Color by Number of Connections: Medium*

`InoutConnectionColor`	• *Different Color by Type of Connections: Inout* • *Different Color by Number of Connections: Large*
`MixtureConnectionColor`	• *Single Color: <color>* • *Different Color by Type of Connections: Inout*
`ShowConnectionWithWidth`	*Different Width by Number of Connections*
`FLWidthThresholdLow`	*Number of Connections* ◦ *Small* - Fewer than specified low threshold
`FLWidthThresholdHigh`	◦ *Medium* - Equal to or between than specified low and high thresholds ◦ *Large* - Greater than specified high threshold
`NoInstFlightLine`	*Don't Show Connection to Unselected Object* ◦ *Instance*
`NoBlockFlightLine`	◦ *Block*
`NoModuleFlightLine`	◦ *Module*
`NoBlackBlobFlightLine`	◦ *Black Blob*
`NoBlackBoxFlightLine`	◦ *Black Box*

InstanceText	***Text***	*Instance Text* ◦ *Instance Name* ◦ *Master Name*
ShowNetFullName		*Show Full Net Name*
ShowNetNameWithLayerColor		*Show Net Name With Layer Color*
ShowModuleText		*Object Text Display* ◦ *Module*
ShowAmoebaModuleText		◦ *Module in Amoeba*
ShowRowSiteText		◦ *Row Site*
ShowIoPadText		◦ *IO Pad*
ShowInstanceText		◦ *Instance*
ShowInstancePinText		◦ *Instance Pin*
ShowBlackBlobText		◦ *Black Blob*
ShowIoPinText		◦ *IO Pin*
ShowGroupText		◦ *Group*
ShowBumpText		◦ *Bump*
ShowClockTreeText		◦ *Clock Tree*
ShowChannelText		◦ *Channel*
ShowLefPortNumText		◦ *Lef Port Num*

ShowMacroSitePtnText		◦ *Macro Site Ptn*
ShowSIPFingerText		◦ *SIP Finger*
ShowNetText		◦ *Net*
TextDisplaySize		*Text Display Size* ◦ Small ◦ Medium ◦ Large ◦ Auto
TermCrossPix		*Term Cross Symbol Size*

Note: Options on the ***Windows*** tab of the Preferences form map to the `setWindowPreference` command instead of the `setPreference` command.

The following table lists the preference variables you can set using the `setPreference` command and their type, range/default/sample value.

Note: The following table might not be readable when viewed with the Unix man command. Check the `setPreference` command description in the *Innovus Text Command Reference* to view the table.

Variable Name	Type	Range/Default/Sample Value (Default values in bold)
DesignName	String	/spc/spc4/FE_tests_7.1/designs.. ../dtmf_pso/dtmf_fpd.enc.dat

TextDisplaySize	Enum	**s**, m, l, a
TermCrossPix	Enum	0, **4**, 6, 8

Examples

- The following command writes log to command, log, and screen:
  ```
  setPreference CmdLogMode 2
  ```
- The following command sets the time between clicks in a double-click operation to 500 milliseconds:
  ```
  setPreference DoubleClickTime 500
  ```

Related Topics

- getPreference
- For more information on setting preferences from the GUI, see Set Preference form in the View Menu chapter in the *Innovus Menu Reference*.

setTopCell

`setTopCell` *`cellName`*

Switches the design to the partition specified by the *`cellName`*.

Note: Cadence recommends that you use the same name for the top cell and the partition.

You can use this command only after you commit the partition.

Parameters

`cellName`	The name of the top cell that indicates a different partition. *Data_type*: string, required

Related Topics

- Hierarchical Flow Capabilities chapter in the Innovus User Guide
  - Partitioning the Design - Restoring the Top-Level Floorplan with Partition Data

setWindowPreference

```
setWindowPreference
[-help]
window_name
{on | off}
```

Enables or disables windows (panels) from the Innovus main display. You can save these window settings in the .enc file in your home directory. The settings are automatically loaded when invoking the Innovus main window.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setWindowPreference` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setWindowPreference`.
`window_name`	Specifies the name of the window you want to turn on or off in the Innovus main display. You can select from the following: • `properties` -- Controls the Attribute Viewer panel. • `status` -- Controls the message bar display, which shows object identifier or coordinate information. • `toolbox` -- Controls the tool widget display. • `viewColor` -- Controls the visibility, selectability, and color display of various attributes. • `world` -- Controls the satellite window display. *Data_type*: string, required
`{on | off}`	Specifies whether window shoud be turned on or off. *Data_type*: string, required

Example

The following command turns on the tool widget display:

```
setWindowPreference toolbox on
```

source

```
source
[-help]
filename
[-quiet  | -verbose ] [-quiet  | -echo ]
```

Reads a file and executes the commands in the file (scripts). You can source an encrypted file created by the `encrypt` command. To be sourced, the file must have suffix “p” added to the file name, for example, test.tcl being encrypted as test.tclp.

Parameters

`-help`	Describes the command usage.
filename	Specifies the name of the file to source. *Data_type*: string, required
`-quiet`	Disable verbose source. *Data_type*: bool, optional
`-verbose`	Enable verbose source. *Data_type*: bool, optional
`-echo`	Enable verbose source. *Data_type*: bool, optional

With no `-quiet, -verbose, -echo` argument, file is sourced according to the `enc_source_verbose` global.

Note that the setting of `-quiet, -verbose, -echo` argument only affects the verbosity of sourcing the outermost file. If that file contains nested `source` commands, the verbosity of those nested commands is controlled by their associated `[-quiet | -verbose | -echo]` arguments or the `enc_source_verbose` global if no arguments.

Related Topics

- `enc_source_verbose`
- `enc_source_continue_on_error`
- `enc_source_echo_filename`

summaryReport

```
summaryReport
[-help]
[-outdir directoryName]
[-noText | -noHtml]
[-outfile fileName | -noText]
[-noHtml | -browser] [-exclude_base_cell_for_density cell_name_list | -
exclude_inst_prefix list_of_prefixes]
```

Reports statistics for the entire design, or a selected object in the design. A report on the entire design includes statistics for the following categories:

- General design information
- General library information
- Netlist information
- Timing information
- Floorplan/Placement information

To display information about a selected object in the design, you must select the object first before using `summaryReport`. The information contained in the report varies depending on the object you select. You can select a module, an instance, or a net.

You can use this command at any time after importing a design.

Parameters

`-browser`	Opens a browser and displays the HTML version of the report. *Data_type*: bool, optional
`-exclude_base_cell_for_density` *cell_name_list*	Specifies the list of cells to be excluded from the density report. You can use the wildcard, *, with this parameter. *Data_type*: (libCell/ptnCell)+, optional
`-exclude_inst_prefix` *list_of_prefixes*	Specifies the list of prefixes to map all instance names to be excluded from the density report. *Data_type*: string, optional

`-noHtml`	Generates only a text version of the report. **Note:** If you specify `-noHtml`, you cannot specify `-noText`. *Default:* The report is generated in both HTML and text format. *Data_type*: bool, optional
`-noText`	Generates only an HTML version of the report. Some statistics in the sections on the main HTML report page include links to more detailed HTML report pages. For example, if you click on the *# Layers* link under the *General Library Information* section of the HTML report, the software displays a detailed HTML report on the layers in the design. **Note:** If you specify `-noText`, you cannot specify `-noHtml`. *Default:* The report is generated in both HTML and text format. *Data_type*: bool, optional
`-outdir` *directoryName*	Specifies the directory in which the HTML and text reports are saved. If `-noText` is specified, saves only the HTML version of the report to the specified directory. The `-outdir` parameter cannot be used with `-noHtml`. *Default:* `summaryReport` *Data_type*: string, optional
`-outfile` *fileName*	Writes the text version of the report to the specified file. **Note:** You can specify this option only if you specify `-noHtml`. *Default:* If you specify `-noHtml` and do not specify `-outFile`, the software writes the text version of the report to a file named *design_name*`.main.htm.ascii` in the `summaryReport` folder. *Data_type*: string, optional

Examples

Examples

- The following command reports statics for the entire design and generates a text version of the results called `summaryReport.rpt`:

  ```
  summaryReport -noHtml -outfile summaryReport.rpt
  ```

  The following is a sample of the resulting text report:

  ```
  ==============================

  General Design Information

```

- The following command also reports statics for the entire design, but creates both a text version and an HTML version of the results. Both versions of the report are saved in the `myReport` directory. The text version is named `dtmf_chip.main.htm.ascii` whereas the HTML report is saved as *`design_name`*`.main.htm`.

  ```
  summaryReport -outdir myReport
  ```

Related Topics

- For an example of an HTML report, see "HTML Summary Report" in the File Menu chapter of the *Innovus Menu Reference*.

suppressMessage

```
suppressMessage
[-help]
prefix numId [numId2 … numIdn]
```

Suppresses error or warning messages identified by a unique ID.

Note: This command suppresses the specified message regardless of the setting specified by the `setMessageLimit` command. For example, consider the case where you have used the `setMessageLimit` command to specify that a message should be suppressed after a fixed number of occurrences. If you now run the `suppressMessage` command on this message, the message will be suppressed, irrespective of the number of times it occurs.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `supressMessage` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man suppressMessage`.
`prefix` *`numId`* `[`*`numId2 … numIdn`*`]`	Specifies the prefix for the error or warning message. *`numId`: Specifies the unique numerical ID of the message to suppress.* *`numId2 … numIdn`: Specifies additional numerical IDs for the same prefix.* *Data_type*: string, optional

Examples

- The following command suppresses the warning messages with the message ID SI-2190:
  ```
  suppressMessage SI 2190
  ```
- This example suppresses *SOCLF-200* warning messages during design import:
  ```
  suppressMessage SOCLF 200
  ```
- This example suppresses SOCLF-80 and SOCLF-200 warning messages during design import:
  ```
  suppressMessage SOCLF 80 200
  ```
- Alternatively, you can explicitly name each message. This example also suppresses *SOCLF-80 and SOCLF-200* warning messages during design import:
  ```
  suppressMessage SOCLF-80 SOCLF-200
  ```
- This example suppresses *SOCLF-80, SOCLF-200, SOCPTN-160, and SOCPTN-400* warning messages:
  ```
  suppressMessage SOCLF 80 200 SOCPTN 160 400
  ```
- Alternatively, you can explicitly name each message. This example also suppresses SOCLF-80, SOCLF-200, SOCPTN-160, and SOCPTN-400 warning messages.
  ```
  suppressMessage SOCLF-80 SOCLF-200 SOCPTN-160 SOCPTN-400
  ```
- This example suppresses all messages from the *SOCLF* catalog during design import:
  ```
  suppressMessage SOCLF
  ```
- Multiple parameters can be used in combination on a single line. This example suppresses all *SOCLF* messages and *SOCECO-90* messages.
  ```
  suppressMessage SOCLF SOCECO-90
  ```
- The following command will suppress the SOCLF-8 message.
  ```
  suppressMessage SOCLF 8*
  ```
  * (asterisk) is not allowed in the suppressMessage command.

Related Topics

- setMessageLimit

suspend

```
suspend [-help]
```

Suspends your script and returns to the Innovus prompt.

The `suspend` command gives you more flexibility in managing and debugging your scripts. You can insert multiple `suspend` commands in a script. The `suspend` command can also be used in nested scripts. When the script reaches a point where you have inserted the `suspend` command, it stops and restores access to the Innovus prompt. You can then type any command required for debugging.

Whenever you want to resume your script, just type `resume` at the Innovus prompt.

Parameters

`-help`	Prints the usage of the `suspend` command. For a detailed description of the command, use the `man` command: `man suspend`.

Related Topics

- `resume`
- "Interrupting the Software" section of the Getting Started chapter in the *Innovus User Guide*

time_info

```
time_info
[-help]
[stage_name]
[-current]
[-report]
[-stamp]
[-table metric_table_id]
```

Reports and tracks runtime and memory performance.

When the `time_info` command is used without any name, an entry for the stage is created in the table named as "undefined". When the command is used multiple times without any stage name, the stage name is incremented, for example undefined1, undefined2, undefined3. This will ensure that each stage name in the table is unique.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `time_info` parameter. For a detailed description of the command and all of its parameters, use the man command: `man time_info`.
stage_name	Specifies the name of the stage.
`-current`	Reports the current stage.
`-report`	Reports all stages up to this point
`-stamp`	Creates a time stamp.
`-table` *metric_table_id*	Specifies metrics table ID to support multiple tables. *Default*: 'default'

Examples

- The following command shows the usage of the `-current` parameter:

```
[DEV]innovus 4> time_info -current
=====================================================
CPU Runtime: 0:00:52.5
Wall Runtime: 0:03:41
Memory Usage: 1387.4 MBytes
Peak Memory Usage: 1505.3 MBytes
Current Time: 12:17:13 (Jul07)
=====================================================
```

- The following command shows the usage of -report:

```
@[DEV]innovus 6> time_info -report
Total Wall | Stage Wall | Wall % | Date - Time     | Memory   | Stage
---------------+---------------+-----------+------------------+-----------+--
--------------------
0:00:00    | 0:00:00    | 0.0%   | 8:27:08 (Jul07) | 824.3 MB | init
---------------+---------------+-----------+------------------+-----------+--
--------------------
Number of threads: 1 * 1 (id: default)
```

uiGetRecordObjByInfo

```
uiGetRecordObjByInfo
[-help]
[-layer layer_value]
[-name object_name]
-objType {viaInst sViaInst sWire wire pWire pBlkg}
-rect {x1 y1 x2 y2}
```

Returns the point of an object based on specific layer/name/area.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `uiGetRecordObjByInfo` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man uiGetRecordObjByInfo`.
`-layer layer_value`	Specifies the layer value or layer range. *Data_type*: string, optional
`-name object_name`	Specifies the object name of net name for wire/sWire/pWire/viaInst/sViaInst. *Data_type*: string, optional
`-objType {viaInst sViaInst sWire wire pWire pBlkg}`	Specifies the object type. *Data_type*: enum, required
`-rect {x1 y1 x2 y2}`	Specifies the coordinates of the object bounding-box. *Data_type*: box, required

Example

The following command returns the point of wire which area is `{365.83 989.66 384.59 989.94}`, layer value is `3`, net name is `DTMF_INST/TDSP_CORE_INST/MPY_32_INST/ab_b[6]`.

```
uiGetRecordObjByInfo -objType wire -rect {365.83 989.66 384.59 989.94} -layer 3 -name
{DTMF_INST/TDSP_CORE_INST/MPY_32_INST/ab_b[6]}
```

unsetMessageLimit

```
unsetMessageLimit
[-help]
[prefix [ID1, ID2, ...]]
```

Removes the default or user-specified limit on error and warning messages. All errors and warnings are output to log.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `unsetMessageLimit` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man unsetMessageLimit`.
prefix [*ID1*, *ID2*...]	Removes the default or user-specified limit on error and warning messages with prefix. If no prefix is specified, the command removes the default or user-specified limit on error and warning messages. All errors and warnings are output to log. *Data_type*: string, optional

Example

The following command removes the limit on the number of error or warning messages to display:

```
unsetMessageLimit
```

Related Topics

- `setMessageLimit`

unsuppressMessage

```
unsuppressMessage
prefix numId [numId2 … numIdn]
```

Reverses the effect of the `suppressMessage` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `supressMessage` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man suppressMessage`.
`prefix numId [numId2 … numIdn]`	Specifies the prefix for the error or warning message. *`numId`*: Specifies the unique numerical ID of the message to unsuppress. *`numId2 … numIdn`*: Specifies additional numerical IDs for the same alpha prefix. *Data_type*: string, required

Examples

- The following command unsuppresses the warning messages with the message ID `SI-2190`:

  ```
  unsuppressMessage SI 2190
  ```

- This example suppresses the occurrence of the messages *SOCECO-308* and *SOCECO-310* during *optDesign -preCts*. For the rest of the flow, *SOCECO-308* is displayed but *SOCECO-310* continues to be suppressed.

  ```
  suppressMessage SOCECO 308 310

  optDesign -preCts

  unsuppressMessage SOCECO-308
  ```

- Multiple parameters can be used in combination on a single line. This example unsuppresses all *SOCECO* messages and *SOCLF-80* messages.

  ```
  unsuppressMessage SOCLF 80 SOCECO
  ```

[-reserved_words string]
[-restricted string]
[-suffix string [-name_collision]]
[-system_verilog]
[-verilog]
[-vhdl]
```

Updates the inst, net, phys_insts, port, module, and design names at each level of hierarchy. The inst and net names are local to only one level of hierarchy, as seen by Verilog inside a module.

If a net or port name is a part of a bus definition, then only the base bus name is updated, and the bus-bits are not modified. So for example, a net named 'busA[0]' specifies that the base bus name is 'busA', which can be changed to 'busB[0]'. However, the '[0]' part will not be changed.

If a net or port name is an escaped scalar name, then all the characters can be modified. So in such a case, an escaped Verilog name like '\busA[0] ' can be changed to 'busA_0_' using various matching options available as shown in the Examples section below.

You can restrict the changes to just one name type using parameters, such as `-inst`, `-net`, `-port`, `-`

`module`, or `-design`. Otherwise, the requested change is applied to all the name types.

By default, there is no restriction on the length of the new names (see `-max_length`).

Each name is checked, and the characters or strings are removed, replaced, or added according to the parameters explained below. Then the final name is checked for collisions with any existing names. If the new name collides with an existing name, a suffix such as _1 and _2 is appended until it is unique.

The old and new names for each modified name are reported.

Note: Names used for SDC timing constraints can only be modified if they are loaded into memory. So you must make sure all the timing views are loaded with `set_analysis_view` before running this command.

Note: There is a limitation that names used inside a CPF `power_intent` file cannot be updated. CPF usage assumes that the CPF file is golden and should not be modified. If you need to change names used inside a CPF file, you need to update the CPF file manually and then read in the new CPF file after running `update_names`. In contrast, an IEEE1801 `power_intent` file is allowed to change during the design flow, so changing any pin, instance or net names with `update_names` will automatically update the IEEE 1801 names. You can write out the new IEEE1801 file with the updated names.

Parameters

`-allowed` *chars*	Specifies the characters that are allowed in the names. Any characters that are not in the allowed list will be removed in the final name. The minimum specification is 10 characters. To allow all the letters from a to z in capital and lower case letters, you must specify all of them. Use `-regexp` to allow dash "-" as a character range indicator. Type: string, optional
`-append_log`	Appends the report to `<out_file>` specified with the `-log_file` option. If you omit this option, `<out_file>` is overwritten. You can specify this option only if you have specified the `-log_file` option. Type: bool, optional

`-change_modules` *`hinsts_modules`*	Limits the name changes to the objects inside the specified list of modules or modules of the `hinsts`. The changes are applied recursively down the hierarchy below each module, unless the `-local` parameter is specified. The current design is used by default, if this parameter is not used. Type: `(hInst|vCell|topCell)+`, optional
`-design`	Changes only the design module name. Type: bool, optional
`-first_restricted` *`chars`*	Specifies the characters that cannot be used in the beginning of the name. Those will be removed, including repeated characters. So `-first_restricted {_#%$}` will change _$abc to just abc. Type: string, optional
`-help`	Prints the command usage.
`-honor_dont_touch`	Prevents renaming of the objects, for which the `dont_touch` attribute is set.
`-hport`	Changes the port names (e.g. Verilog input, output, or inout names) of the intermediate modules for all hinsts, including bus port names. It also modifies the same implicit net name connected to the port to match the new port name. It does not modify the port names of library cells or the top-level design. Type: bool, optional
`-inst`	Changes only the Verilog instance names at each level of hierarchy. Type: bool, optional
`-last_restricted` *`chars`*	Specifies the characters that cannot be used at the ending of a name. Those will be removed, including repeated chars. Type: string, optional

`-local`	Turns off the recursive descent, so that changes become local to the module or design. The objects defined in the design/module can be modified (for example, design/module, `port`/`hport`, `inst`, or `net` names), but sub-module names and `hport` names of sub-modules cannot be modified. Type: bool, optional
`-log_file` *out_file*	Specifies a log file for the output report that shows the old name and the new name for any name changes. Type: string, optional
`-map {{`*from to*`}...}`	Takes a list of string pairs and maps the first string to the second string in each pair. You need to enclose each pair in braces. To be compatible with Genus usage, double quotes are optionally allowed around the strings. For example, both `-map {{"from" "to"} {"AND" "and"}}` and `-map {{from to} {AND and}}` will result in the same output. Type: string, optional
`-max_length` *int*	Limits the length of the changed name to the specified number of characters. If the name exceeds the limit, the additional characters will be truncated from the end. If the new name is not unique, the original name is further trimmed back to allow the name with a suffix, such as 1, 2, etc. to make it unique and within the specified length limit. Note, the truncation happens after all other changes. This means the truncated names may now collide with -vhdl, -verilog, or -system_verilog reserved names, or end with a char from the -last_restricted set. If that happens, you will have to rerun the command with the same options and either a longer -max_length or no -max_length. Type: Integer, optional
`-module`	Changes all module names other than the design module name. Type: bool, optional

`-name_collision`	Adds only the `-prefix` or `-suffix` values, if a name change collides with an existing name. This parameter can be used only when either the `-prefix` or `-suffix` parameter is used.
`-net`	Changes the Verilog net names at each level of hierarchy (e.g. Verilog wire names). This will not modify net names that correspond to Verilog port definitions (e.g. Verilog input, output or inout names). If you want to modify those net names, use the -port option. Type: bool, optional
`-no_verbose`	Suppresses the output generated from `update_names`. Type: bool, optional
`-nocase`	Changes names that collide if the case is ignored. For example, if both net1 and Net1 exist, one of them will be changed to resolve the collision by appending a suffix, such as _1 or _2. Type: bool, optional
`-phys_inst`	Changes only those physical inst names (like filler cells) that do not appear normally in the Verilog output. When this parameter is specified, the module-scoping parameters (like `-change_modules`) are ignored, so all the physical inst names are checked. Type: bool, optional
`-port`	Changes the port names (e.g. Verilog input, output, or inout names) of the top-level module for the design, including bus port names. It also modifies the same implicit net name connected to the port to match the new port name. It does not modify the port names of library cells or intermediate modules. Type: bool, optional
`-prefix` *string*	Adds a prefix to the names that are changed.

`-random`	Makes all the modified names random. It obfuscates the design names so that the test cases can be shared without exposing the real netlist names. This parameter cannot be used with any other parameter that affects names. It can be used with `-inst`, `-net`, `-hport`, `-design`, and `-port` to limit the types of names to be modified.

`-random_map_dir` *`out_dir`*	Specifies the `out_dir` (output directory) for the map-file of the old and new random names to be written for each name type that is modified inside the output directory. This parameter requires the `-random` parameter. It is useful in the cases when there are side files that have names to be mapped and are not supported by `update_names`. The following files are written:
	`inst.map for inst and hinst names`
	`net.map for net and hnet names`
	`pin.map for hport and pin names`
	`port.map for top-level port names`
	`module.map for module names`
	The format is *`old_name new_name`* on each line for every name. For example, `inst.map` may look like:
	`blockA/blockB/regC i1/i2/i3`
	`blockA/regD i1/i3`
	…

`-regexp`	Allows specifying character ranges with a dash "-" in the `-allowed` option. This is similar to regexp single character matching usage. For example, to allow all alphanumerical characters, along with _ and $ as legal chars, use: -allowed {a-zA-Z0-9_$} Type: bool, optional
`-replace_str` *`string`*	Specifies the replacement string for `-restricted` or `-reserved_words` strings. The default value for this option is "_". Type: string, optional

`-reserved_words` *string*	Specifies a list of words to be avoided (reserved words), like 'begin end'. If a complete name exactly matches one of the reserved words (not just a sub-string of the name), then by default, the name will be changed with the addition of an `_1`, `_2`, etc. suffix. If you also specify the `-replace_string` *rep_str* parameter, then the reserved words will be replaced by *rep_str* instead, and the `_1`, `_2`, etc. will be appended, if there are any collisions. Type: string, optional
`-restricted` *string*	Specifies a list of strings that cannot be used inside a name. Each string is replaced with the `-replace_str` string. For example, `-restricted {ab bc}` will replace all the `ab` and `bc` strings inside the names. Type: string, optional
`-suffix` *string*	Adds a suffix to the names that are changed. **Note:** If the length of `-suffix` exceeds the `-max_length` value, the suffix is truncated.
`-system_verilog`	Replaces SystemVerilog reserved words. If a complete name exactly matches one of the reserved words (not just a sub-string of the name), then the name will be changed. Type: bool, optional
`-verilog`	Replaces Verilog reserved words. If a complete name exactly matches with one of the Verilog reserved words (not only a sub-string of the name), then the name will be changed. Type: bool, optional

`-vhdl`	Fixes names to meet VHDL identifier requirements. It replaces VHDL reserved words. If a complete name exactly matches one of the VHDL reserved words (not only a sub-string of the name), then the name will be changed. It also implicitly uses –first_restricted “_0123456789” to remove any leading _ or digit chars, and –last_restricted “_” to remove any trailing _ chars, so you cannot use –vhdl together with –first_restricted or –last_restricted. Finally, this option will remove any repeated _ chars in the middle of any name, and replace it with a single _ char because VHDL does not allow repeated _ chars. Type: bool, optional

Examples

- The following command replaces the `p1` inst name with the `prefix_p1` prefix without updating all the `p1` sub-strings (for example, without changing `insts` named `p12` or `op1`):
  ```
  update_names -inst -reserved_words {p1} -replace_string {prefix_p1}
  ```
- The following example replaces sub-string "no" with "NO", and all brackets "[" and "]" with underscore "_" in all net names:
  ```
  innovus 1> update_names -net -map {{no NO} {[ _} {] _}}
  ```
  Optional double-quotes are ignored, so this has the same result:
  ```
  innovus 1> update_names -net -map {{"no" "NO"} {"[" "_"} {"]" "_"}}
  ```
  So, a Verilog net name that requires escaping like:
  `\test[0]nox` would change to `test_0_NOx`
  Note, neither the Verilog or DEF name requires escaping anymore, so no \ would be written to Verilog or DEF for these names. A “real” bus name like
  `no[0]` would just be changed to `NO[0]`
  because the `[0]` are bus-bit chars and values that are never changed.
- The following example replaces any sub-strings that match ab, bc, or ca with "@" in all object names:
  ```
  innovus 1> update_names -restricted "ab bc ca" -replace_str "@"
  ```
- The following command changes the brackets "[" and "]" in all names to "_". It does not change real bus-bit chars for nets.

```
innovus 1> update_names -restricted {[ ]} -replace_str "_"
```

Note: You should use {} to protect the [] from being interpreted by Tcl.

- The following example specifies the maximum length of all module names to be 12 characters.

  ```
  innovus 1> update_names -max_length 12 -module
  ```

- The following example fixes case-insensitive collisions. Suppose you have two insts named inst73 and INST73. This command renames one of the insts by appending _<num> to one of the names for avoiding a naming conflict, when casing is ignored.

  ```
  innovus 1> update_names -inst -nocase
  ```

- The following example allows all capital and lower case letters, numbers, underscores, backslash, and brackets. Any other character will be removed.

  ```
  innovus 1> update_names -allowed
  {ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789_\[]}
  ```

  If you want to use character ranges, you can use `-regexp`:

  ```
  innovus 1> update_names -regexp -allowed {a-zA-Z0-9_\[]}
  ```

- If you want to change names that collide with reserved Verilog words, then use the following command:

  ```
  innovus 1> update_names -verilog
  ```

  Names that exactly match a Verilog reserved words, like "input" will be replaced with "input_1". This does not replace sub-strings in names that match "input", so "my_input" would not be modified.

Related Topics

`rename_obj`

viewLog

```
viewLog
[-help]
[-file logFileName]
```

Opens up a log file in a separate console window for viewing within the Innovus.

The log file viewer within the Innovus opens the current log file by default, and updates it in real time. If you specify a log file name, the software opens up the specified log file.

The log file displayed contains `[+]` and `[-]` markers that expand and collapse command information, so that you can control how much detail you want to read. Log messages are color coded for easier identification: blue messages are warnings, red messages are errors.

You can access documentation for commands in the log file that are underlined. Click on the command in the file, and the software opens an HTML window displaying the *Innovus Text Command Reference* documentation for that command.

You also can access the log file viewer from the Tools Menu - *Log Viewer*.

Note: You can specify `viewLog` more than once to view multiple log files in separate console windows simultaneously. However, you cannot open multiple versions of the current log file.

Parameters

`-file` *`logFileName`*	Specifies the name of the log file to open. *Data_type*: string, optional
`-help`	Outputs a brief description that includes type and default information for each `viewLog` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man viewLog`.

Related Topic

- Tools Menu chapter in *Menu Reference*.

vPuts

```
vPuts
[-help]
[string]
[-nonewline]
```

Outputs information to the verbose log file (innovus.logv) and the standard output.

If the verbose log file is not available (invoked with `innovus -no_logv`), the `vPuts` command outputs only to the standard output.

Parameters

`-help`	Prints a brief description of the command. For a detailed description of the command, use the `man` command: `man vPuts`
`string`	Specifies the output string.
`-nonewline`	When you specify this option, the command does not output a newline character after the output string. *Data_type*: bool, optional

Related Topics

- `innovus`

win

```
win
[-help]
[on | off]
```

Opens the Innovus main window. This is usually done after executing the command `innovus -init` *`tclCommandFile`*.

If you run the `win` command when the Innovus main window is already open, the tool retains the current zoom level and displays the main window without refreshing it. For example:

```
innovus 23> zoomBox 94 -640 95 -645
innovus 24> win
```

This displays the main window with the design zoomed to the coordinates "`94 -640 95 -645`".

Note: If you started the Innovus software with the `innovus -nowin` command, you cannot then use the `win` command to display the Innovus main window.

Parameters

`-help`	Prints a brief description that includes type and default information for each `win` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man win`
`on | off`	Specifies whether to switch on or off the window. *Data_type*: string, optional

- `innovus`

writeFlowTemplate

```
writeFlowTemplate
-help
[-directory directory_name]
```

Copies the Innovus Foundation flows templates into the directory you specify, or to the current directory if you do not specify one with the `-directory` parameter.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `writeFlowTemplate` parameter. For a detailed description of the command and all of its parameters, use the man command: `man writeFlowTemplate`
`-directory` *`directory_name`*	Specifies the directory in which to save the templates. *Data_type*: string, optional

auto_file_dir

`auto_file_dir` *directoryName*

Type: String

Default: ./

Specifies the directory to store files/sub-directories 'auto-generated' by the tool. This includes report files or other output files with default names that are automatically created by some commands in the current run directory. Default names that have been overridden with a name chosen by the user, are not affected. This allows multiple simultaneous runs from the same run directory to direct output files to different result directories to avoid collisions.

Related Topics

- `auto_file_prefix`

auto_file_prefix

`auto_file_prefix`

Type: String

Default: ""

Specifies a prefix to be applied to all files 'auto-generated' by the tool. This includes report files or other output files with default names that are automatically created by some commands in the current run directory. So a default name like "cmd.report" will become "<prefix>cmd.report". Default names that have been overridden with a name chosen by the user, are not affected. This allows multiple simultaneous runs from the same run directory to direct default output files to different locations to avoid collisions.

Related Topics

- `auto_file_dir`

enable_legacy_metric

```
enable_legacy_metric {true | false}
```

Type: Boolean

Default: `false`

Enables the legacy `get_metric` command. If set to `true`, the `get_metric` command used is old legacy.

Related Topics

- `get_metric`

enc_partial_cmd_argument_matching

enc_partial_cmd_argument_matching

Type: enum

Choices: `error`, `warn`, `quiet`

Default: `quiet`

Enables partial command argument matching.

- `error`: Does not allow partial argument matching. System will issue errors when command arguments are uniquely matched from a partial specification.
- `warn`: Allows partial argument matching. System will issue warnings when command arguments are uniquely matched from a partial specification.
- `quiet`: Allows partial argument matching without any warnings or errors.

enc_print_full_message_summary

```
enc_print_full_message_summary
```

Type: boolean

Default: `false`

Controls the format of the message summary. If `true`, prints full message, otherwise prints truncated message.

enc_source_continue_on_error

`enc_source_continue_on_error` *value*

Type: Boolean

Default: `false`

Enables or disables `source` command to continue the script on tcl error. When set to `true`, the `source` command will ignore tcl errors and continue processing the script files. When set to `false`, a tcl error will halt the script.

Example

In the following example, the Tcl File (test.tcl) has an error i.e. no option specified after hyphen (-) for the `setDesignMode` command in the script.

test.tcl content:

```
::::::::::::

puts "Testing Script for Errors"

setDesignMode -

puts "End Testing Script for errors"

::::::::::::
```

If `enc_source_continue_on_error` is set to `false`, and `setDesignMode` is specified with hyphen only (without the option name after the hyphen), the script will end and will not source other commands mentioned after `setDesignMode`.

```
innovus 3> set enc_source_continue_on_error false

false

innovus 4> source test.tcl

Testing Script for Errors

Usage: setDesignMode [-help] [-reset] [-addPhysicalCell {hier|flat}] [-congEffort
{low|medium|high|auto}] [-dual_rail_via_pitch <min_via_pitch> <min_filler_via_pitch>
<cell_boundary_spacing>] [-earlyClockFlow {true|false}] [-expressRoute {true|false}]
[-flowEffort {express|standard|extreme}] [-ignore_followpin_vias {true|false}] [-
pessimisticMode {true|false}] [-powerEffort {none|low|high}] [-process <integer>] [-
slackWeighting {unityWeighting|viewBasedWeighting}]
```

```
**ERROR: (IMPTCM-48):   ""-"" is not a legal option for command ""setDesignMode"".
Either the current option or an option prior to it is not specified correctly.
```

If `enc_source_continue_on_error` is set to `true`, and `setDesignMode` is specified with hyphen only (without the option name after the hyphen), the script will throw an error and continue to source the other commands without exiting.

```
innovus 5> set enc_source_continue_on_error true

true

innovus 6> source test.tcl

Testing Script for Errors

Usage: setDesignMode [-help] [-reset] [-addPhysicalCell {hier|flat}] [-congEffort
{low|medium|high|auto}] [-dual_rail_via_pitch <min_via_pitch> <min_filler_via_pitch>
<cell_boundary_spacing>] [-earlyClockFlow {true|false}] [-expressRoute {true|false}]
[-flowEffort {express|standard|extreme}] [-ignore_followpin_vias {true|false}] [-
pessimisticMode {true|false}] [-powerEffort {none|low|high}] [-process <integer>] [-
slackWeighting {unityWeighting|viewBasedWeighting}]

**ERROR: (IMPTCM-48):   ""-"" is not a legal option for command ""setDesignMode"".
Either the current option or an option prior to it is not specified correctly.

**ERROR: (IMPSE-110):   File 'test.tcl' line 2: errors out.

End Testing Script for errors
```

Related Topics

- source

enc_source_echo_filename

`enc_source_echo_filename` *value*

Type: *Boolean*

Default: `0`

When this setting is enabled, the log file will display the file name being sourced before the actually sourcing the file. By default, name of the file being sourced is not displayed in the log file.

Related Topics

- `source`

enc_source_verbose

`enc_source_verbose` *value*

Type: Integer

Default: `0`

Controls whether scripts are sourced in quiet or verbose mode:

- By default (`0`), files are sourced in quiet mode. This is equivalent to `source` *filename*`-quiet`.
- If you set this variable to `1`, files are sourced in verbose mode. This is equivalent to `source` *filename*`-verbose`.

Related Topics

- `source`

enc_source_verbose_cmd_print_length_limit

`enc_source_verbose_cmd_print_length_limit` *value*

Type: Integer

Default: `-1`

Limits the command printed to stdout and the .log file to the specified number of characters for verbose script source.

Related Commands

- `source`

enc_source_verbose_output

`enc_source_verbose_output`

Type: `enum`

Choices: `debug, echo, echo_comments`

Default: `echo`

Used to control the verbosity of the `source -verbose` output.

- If you specify `echo`, the output will only include the command lines.
- If you specify `debug`, the output will include file name, line number, and command. This option is used to debug problems in scripts.
- If you specify `echo_comments`, the output will include commands, comments and empty lines

Examples

- By default, source -verbose prints only the real command line start with #:

```
[DEV]innovus 3> source -verbose a.tcl
### Start verbose source output (echo mode) for 'a.tcl' ...
# set a b
### End verbose source output for 'a.tcl'.
```

- With `set enc_source_verbose_output echo_comments`, all file contents, including comment lines and empty lines, are printed. Comment lines start with # and command lines start with @:

```
[DEV]innovus 5> source -verbose a.tcl
### Start verbose source output (echo_comments mode) for 'a.tcl' ...

#comment line1\
  comment line2

#line 6 is empty line

@set a b
### End verbose source output for 'a.tcl'.
```

Related Topics

source

enc_tcl_error_info

```
enc_tcl_error_info {true | false}
```

Type: Boolean

Default: `false`

When set to `true`, `enc_tcl_error_info` prints the error information if there is an issue in the Tcl script.

enc_tcl_return_display_limit

```
enc_tcl_return_display_limit value
```

Type: Integer

Default: `10000`

You can use this variable to set the number of characters displayed on the xterm window (stdout) and the .log file. The Tcl return value itself is not truncated. A value of `-1` indicates that there is no display limit. The Tcl return value of the history command will not be truncated by setting this variable.

Example

- In the example below, the tcl return values of `getDesignMode` command options are not truncated. However, the remaining part is truncated to 3 characters.

```
innovus 1> set enc_tcl_return_display_limit 3
innovus 2> getDesignMode
-addPhysicalCell hier                  # enums={hier flat}, default=hier
-congEffort auto                       # enums={low medium high auto},
default=auto
-dual_rail_via_pitch {}                # string, default="""
-earlyClockFlow false                  # bool, default=false
-expressRoute false                    # bool, default=false
-flowEffort standard                   # enums={express standard extreme},
default=standard
-ignore_followpin_vias false           # bool, default=false
-pessimisticMode false                 # enums={true false}, default=false
-powerEffort none                      # enums={none low high}, default=none
-process 90                            # int, default=90, min=3, max=250
-slackWeighting unityWeighting         # enums={unityWeighting
viewBasedWeighting}, default=unityWeighting
{ad... truncated to 3 characters (use the enc_tcl_return_display_limit variable to
control the length before truncation).
```

- In the example below, the value of `enc_tcl_return_display_limit` is set to `-1`. As a result, there is no display limit.

```
innovus 3> set enc_tcl_return_display_limit -1
-1
innovus 4> getDesignMode
-addPhysicalCell hier # enums={hier flat}, default=hier
-congEffort auto # enums={low medium high auto}, default=auto
-dual_rail_via_pitch {} # string, default=""
-earlyClockFlow false # bool, default=false
-expressRoute false # bool, default=false
-flowEffort standard # enums={express standard extreme}, default=standard
-ignore_followpin_vias false # bool, default=false
-pessimisticMode false # enums={true false}, default=false
-powerEffort none # enums={none low high}, default=none
-process 90 # int, default=90, min=3, max=250
-slackWeighting unityWeighting # enums={unityWeighting viewBasedWeighting},
default=unityWeighting

{addPhysicalCell hier} {congEffort auto} {dual_rail_via_pitch {}} {earlyClockFlow
false} {expressRoute false} {flowEffort standard} {ignore_followpin_vias false}
{pessimisticMode false} {powerEffort none} {process 90} {slackWeighting
unityWeighting}
```

encEnableMetric

`encEnableMetric` *value*

Type: Integer

Default: `1000`

Controls design metrics display.

Related Topics

- `get_metric`

gui_verbose

```
gui_verbose {all db none}
```

Type: enum {all db none}, read/write

Default: `db`

Controls which GUI actions are logged. You can select:

- `all`: Logs all GUI actions.
- `db`: Logs the GUI actions that affect the DB, such as `gui_select`, but does not capture display-only actions such as `gui_dim_foreground`.
- `none`: Does not log any GUI actions. So, the .log and .cmd files are incomplete.

highFreqInterposerFlow

```
highFreqInterposerFlow {0 | 1}
```

Type: Boolean

Default: `0`

Specifies the flow as a high frequency interposer flow. When set to `1`, `setIntegRouteConstraint` will auto turn off the options which are not suitable for interposer routing.

Related Topics

- `setIntegRouteConstraint`

load_netlist_ignore_undefined_cell

```
load_netlist_ignore_undefined_cell { 1 | 0 }
```

If `false`, a Verilog reference to an undefined cell (for example, a Verilog module name that has no matching library cell and no Verilog module definition) causes an error and an exit after parsing the netlist. If `true`, an empty Verilog module is created with a warning. The default value is `true` in Innovus to allow repair of 'dirty netlists'. An empty module will become an hinst or inst depending on the value of `setImportMode -keepEmptyModule`.

To set this variable, use the `set` command.

Datatype: boolean

Default: `1`

metric_advanced_url_endpoint

`metric_advanced_url_endpoint` *value*

Default: The default value of this string variable is not set.

Provides pointer to advanced metric server URL to store the snapshot information.

metric_capture_3d_hotspots

```
metric_capture_3d_hotspots {true | false}
```

Type: Boolean

Default: `true`

Captures 3d hotspot metrics.

metric_capture_depth

`metric_capture_depth` *integer*

Default: `0`

Specifies the depth for capturing hinst design and power metrics.

metric_capture_design_image

`metric_capture_design_image` *`string`*

Default: `true`

Captures the design image.

metric_capture_design_image_blockages

```
metric_capture_design_image_blockages {true | false}
```

Default: `true`

Captures blockages in the design image.

metric_capture_design_image_blockages_threshold

`metric_capture_design_image_blockages_threshold` *`threshholdValue`*

Type: Integer

Default: `100`

Threshold for capturing blockages in metric image.

metric_capture_design_image_power_intent

```
metric_capture_design_image_power_intent {true | false}
```

Default: `true`

Captures power intent objects in the design image.

metric_capture_design_image_route_drc

```
metric_capture_design_image_route_drc {true | false}
```

Default: `true`

Captures route DRC markers in the design image.

metric_capture_max_drc_markers

`metric_capture_max_drc_markers` *`max_number`*

Default: `100000`

Specifies the maximum number of DRC markers to include in metric image.

metric_capture_min_count

`metric_capture_min_count` *integer*

Default: `1000`

Captures the minimum instance count for capturing hinst design and power metrics.

metric_capture_overwrite

```
metric_capture_overwrite {true | false}
```

Default: `false`

Overwrites pending metrics during the `createSnapshot` category capture.

metric_capture_pba_tns_histogram

```
metric_capture_pba_tns_histogram {true | false}
```

Default: `false`

Captures the PBA histogram data for TNS.

metric_capture_per_view

```
metric_capture_per_view {true | false}
```

Default: `true`

Captures timing metrics per analysis_view.

metric_capture_reg2reg_metrics

```
metric_capture_reg2reg_metrics [true | false}
```

Default: `false`

Forces the capture of reg2reg metrics regardless of path groups.

metric_capture_timing_analysis_mode

```
metric_capture_timing_analysis_mode {gba | ipba}
```

Type: Enum
Default: gba

Controls the timing analysis mode for metric capture during create_snapshot categories setup and hold; gba, ipba.

- `gba`: graph based analysis
- `ipba`: path based analysis, retime_method == path_slew_propagation, retime_mode == exhaustive, timing_path_based_exhaustive_pba_bounded_mode == true

metric_capture_timing_path_groups

```
metric_capture_timing_path_groups path_group
```

Default: The default value of this string variable is not set.

Controls the path groups for which detailed timing path information (full timing path report and display) is to be captured . By default, it is empty and the tool captures all and reg2reg. If the global is set to a list of groups, the tool will use the listed groups. The related metric name is `timing.setup.paths.path_group:<group>`.

metric_capture_timing_paths

```
metric_capture_timing_paths integer
```

Default: `10`

Specifies the number of paths to capture for detailed display.

metric_capture_tns_histogram

```
metric_capture_tns_histogram {true | false}
```

Default: `true`

Capture histogram data for TNS.

metric_capture_tns_histogram_buckets

`metric_capture_tns_histogram_buckets` *integer*

Default: `50`

Specifies the number of buckets for the TNS histogram.

metric_capture_tns_histogram_max_slack

`metric_capture_tns_histogram_max_slack` *`maximum_slack_value`*

Default: `0`

Specifies the maximum slack value for the TNS histogram. You can change its value if you need to shift the y axis.

metric_capture_tns_histogram_paths

`metric_capture_tns_histogram_paths` *integer*

Default: `10000`

Specifies the number of paths to capture for the TNS histogram.

metric_capture_vth_per_power_domain

```
metric_capture_vth_per_power_domain [true | false}
```

Default: `false`

Captures vth metrics per power domain.

metric_category_default

`metric_category_default` *`metric_category`*

Default: `design`

Specifies to capture the default metric category if none are provided.

metric_current_run_id

`metric_current_run_id`

Default: The default value of this string variable is not set.

Provides the current unique run ID returned by the advanced metric server.

It contains the identifier used with the advanced metric server so that multiple uploads of the data (such as, data upload after fplan, after prects, after cts) are seen as a single execution of the tools. The identifier is created by the advanced metric server so that it is unique and is stored in `metric_current_run_id`.

metric_enable

```
metric_enable {true | false}
```

Default: `false`

Enables the metric snapshot capture.

metric_summary_metrics

```
metric_summary_metrics
```

Default: The default value of this string variable is not set.

Lists metrics to report to log file during `createSnapshot`.

restore_db_directory

```
restore_db_directory directory_name
```

Type: `string`

Default: `""`

Specifies the directory of the current loaded database.

restore_db_file_check

```
restore_db_file_check {true | false}
```

Type: `boolean`

Default: `true`

By default, `restoreDesign` will check all the files inside the saved DB directory. If any file is edited, renamed, or deleted, the tool will give an error. However, `restoreDesign` will not perform this check if `restore_db_file_check` is set to `false`.

restore_db_stop_at_design_in_memory

```
restore_db_stop_at_design_in_memory { 0| 1}
```

Type: Boolean

Default: `1`

By default, tool gives error and stops if you call `restoreDesign` more than once in the same Innovus session unless `restore_db_stop_at_design_in_memory` is set to `0`. Using `restoreDesign` twice in one Innovus session is not recommended as settings from the first database may not be cleaned up properly and can cause problems in the second database.

restore_db_tool

```
restore_db_tool
```

Type: String

Default: Not set

Indicates the name of the tool that created the restored db on the disk database.

script_search_path

`script_search_path`

Default: ".". The default value represents the current application run directory.

Provides a set of directories for the software to search for files that are sourced using the Tcl `source` command. The software searches each search path directory for the specified file.

soft_stack_size_limit

`soft_stack_size_limit`

Default: `10`

Specifies the soft stack size limit in mbytes. When the tool is launched, the the soft stack size limit is auto-enlarged to 0.2% RAM. If 0.2%RAM is larger than the hard limit, the tool sets it to the hard limit.

add_gui_marker

```
add_gui_marker
[-help]
-color <string>
-name <string>
-pt {x y}
-type {X TICK STAR}
```

Places a marker to indicate location on the design layout.

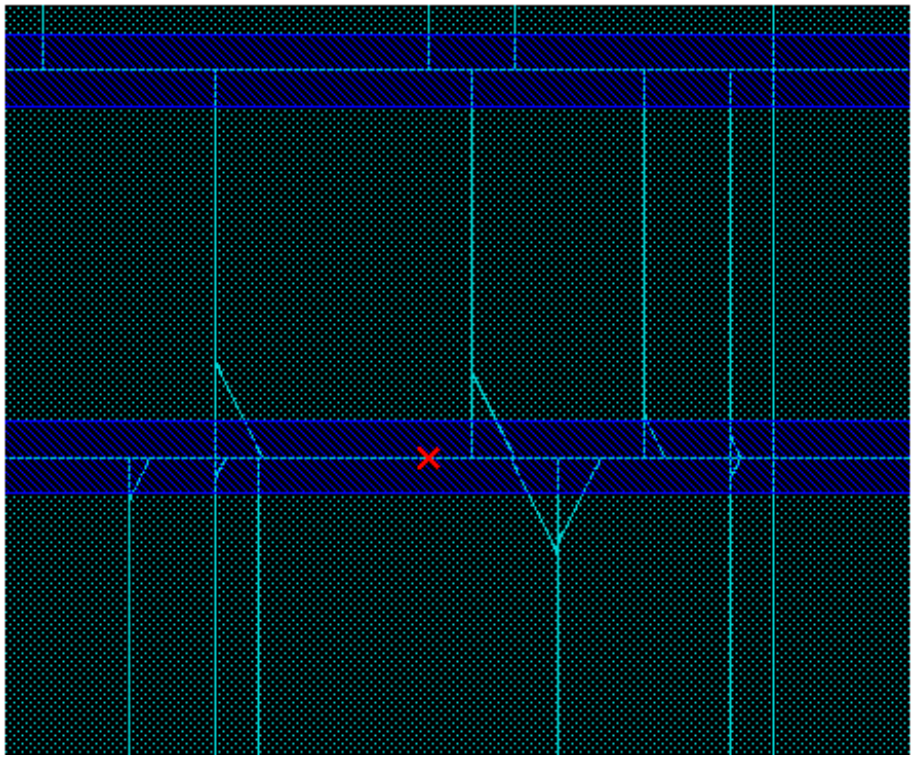
Parameters

`-help`	Outputs the command usage and a brief description about the command parameters.
`-color <string>`	Specifies the color of the marker. You can specify 16 colors for the marker. These are: `red blue green yellow magenta cyan pink orange brown purple violet teal olive gold maroon wheat`
`-name <string>`	Specifies the name of the marker.
`-pt {x y}`	Specifies the location `{x y}` at which the marker will be placed on the design layout.
`-type {X TICK STAR}`	Specifies the shape of the marker. There are three shapes for the markers: X, TICK, and STAR.

Example

- The following command shows that a X type marker of color RED has been placed at the location {100 100}.

```
add_gui_marker -name aa -color red -pt {100 100} -type X
```



Related Information

add_gui_shape

```
add_gui_shape
[-help]
[-layer layerName]
[-name guiShapeName]
[-width width]
{-rect {x1 y1 x2 y2} | -line {x1 y1 x2 y2 ...} | -polygon {x1 y1 x2 y2 ...}}
[-line {x1 y1 x2 y2 ...} [-arrow ] ]
```

Adds a shape to the default or specified custom layer. You can use the `add_gui_shape` command at any point in the design flow. The shapes added by the command annotate comment shapes and do not show up in the DEF output.

Note: In OpenAccess flows, the shapes added with the `add_gui_shape` command are stored in the OpenAccess cellview. However, the shapes are stored in a private structure that is accessible only to Innovus. To create shapes that are visible in Virtuoso as well, use the `add_shape` command instead.

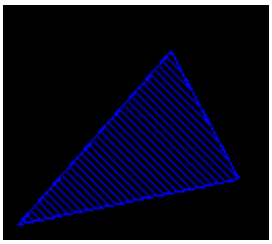
Parameters

`-help`	Prints a brief description that includes type and default information for each `add_gui_shape` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_gui_shape`
`-arrow`	Draws an arrow in the middle of the line segment to indicate the start to end direction. This parameter can only be used with `-line`.
`-layer` *layerName*	Specifies the GUI layer name to use or create for the shape. If the specified layer does not exist, it is created automatically. If a layer is not specified, the tool automatically creates a layer with the name `defaultLayer` and adds the shape to it.
`-line {`*x1 y1 x2 y2 ...*`}`	Creates a line, with *x1 y1 x2 y2* ... specifying the coordinates for the line segments. The values are specified in microns.
`-name` *guiShapeName*	Specifies the name of the GUI shape.
`-polygon {`*x1 y1 x2 y2 ...*`}`	Creates a polygon shape, with *x1 y1 x2 y2* ... specifying the coordinates for the polygon segments. The values are specified in microns.
`-rect {`*x1 y1 x2 y2*`}`	Specifies the coordinates of the lower-left and upper-right points of the rectangle. The values are specified in microns.
`-width` *width*	Specifies the width of the shape border in pixels. The minimum (default) value is `1` and the maximum is `7`.

Examples

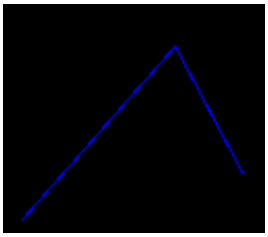
- The following command adds a triangular shape in layer `1`:

```
add_gui_shape -layer 1 -polygon {95.841 -645 96.592 -644.147 96.926 -644.777}
```



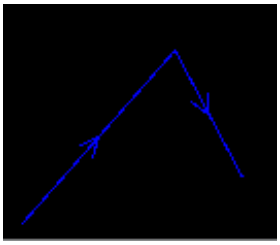
- The following command adds a line shape with two segments:

```
add_gui_shape -layer 1 -line {95.841 -645 96.592 -644.147 96.926 -644.777}
```



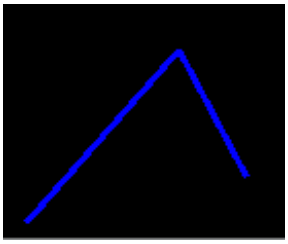
- The following command adds a line shape with two segments and direction arrows:

```
add_gui_shape -layer 1 -line {95.841 -645 96.592 -644.147 96.926 -644.777} -arrow
```



- The following command adds a line shape of 3-pixel width:

```
add_gui_shape -layer 1 -line {95.841 -645 96.592 -644.147 96.926 -644.777} -width
3
```



Related Information

add_gui_text

```
add_gui_text
[-help]
-label text
-layer layerName
{-box {x1 y1 x2 y2} | {{-height height | -fixed_height fixHeight} -pt {x y} [-orient
direction]}}
[-box {x1 y1 x2 y2} [-no_bbox]]
```

Adds text (annotation) to the specified custom layer. You can use the `add_gui_text` command at any point in the design flow. The text added by the command annotates comment text and does not show up in a DEF output.

Note: In OpenAccess flows, any text added with the `add_gui_text` command is stored in the OpenAccess cellview. However, the text is stored in a private structure that is accessible only to Innovus. To create text that is visible in Virtuoso as well, use the `add_text` command instead.

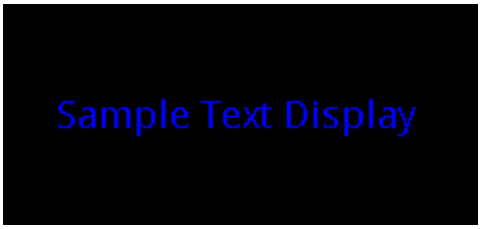
Parameters

`-help`	Prints a brief description that includes type and default information for each `add_gui_text` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man add_gui_text`
`-box {x1 y1 x2 y2}`	Specifies the coordinates of the rectangle in which text will be added. The coordinate values are specified in microns. When this parameter is used, the tool figures out the correct size and orientation to be used to fit the text into the box. The text is center justified in the box. Use this parameter to control the text orientation and size.
`-height height`	Specifies the height of the text in microns.
`-fixed_height fixHeight`	
	Specifies the height in pixels. *`fixHeight`* should be an integer value.
`-label text`	Specifies the text to be displayed. If your text has spaces, enclose it in quotation marks or braces.
`-layer layerName`	Specifies the GUI layer name to use or create for the text. If the specified layer does not exist, it will be automatically created.
`-no_bbox`	Specifies that bounding box should not be drawn when text is displayed at the specified box coordinates. This parameter can be used only when `-box` is specified.
`-orient direction`	Specifies the orientation of the text. Possible values are: `MX MX90 MY MY90 R0 R90 R180 R270` This option cannot be used with `-box`.
`-pt {x y}`	Specifies the origin coordinate of the text (microns).

Examples

- The following command adds the text label `Sample Text Display` with size of 18 pixels on layer `1` at the specified point coordinates:

  ```
  add_gui_text -layer 1 -label "Sample Text Display" -fixed_height 18 -pt {0 250}
  ```

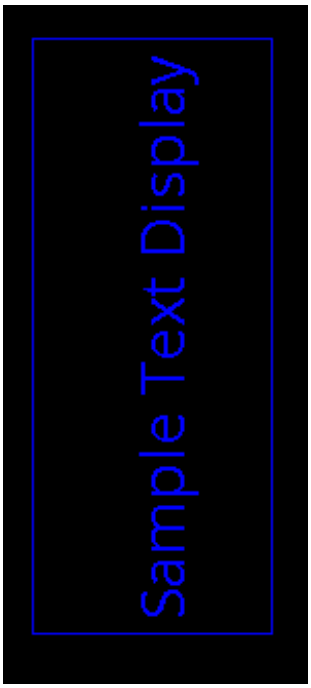
  


- The following command adds the text label `Sample Text Display` on layer `1` in a box with the specified coordinates. As the length of the box is more than the width, the text is displayed horizontally:

  ```
  add_gui_text -layer 1 -box {0 250 500 450} -label "Sample Text Display"
  ```

- The following command adds the text label `Sample Text Display` on layer `1` in a box with the specified coordinates. As the height of the box is more than the width, the text is displayed vertically:

  ```
  add_gui_text -layer 1 -box {0 250 200 750} -label "Sample Text Display"
  ```



- The following command adds the text label `Sample Text` Display on layer `1` at the specified box coordinates. However, the bounding box is not displayed:

```
add_gui_text -layer 1 -box {0 250 500 450} -no_bbox -label "Sample Text Display"
```

clearAllRulers

```
clearAllRulers -help
```

Removes all ruler lines from the main window. You can also clear the ruler lines with the *Clear All Rulers* icon on the toolbar in the main window.

Related Information

- `createRuler`
- The Main Window chapter of *Menu Reference*
  - *Toolbar Widgets*
- Tools Menu chapter of *Menu Reference*
  - *Create Ruler*
  - *Clear All Rulers*

createRuler

```
createRuler
[-help]
{{-center {x y} -radius value} | -coordinates {x1 y1 x2 y2 ...}}
```

Adds a ruler. For an orthogonal ruler, use `-coordinates` to specify ruler segments. For a circular ruler, use `-center` and `-radius`.

Parameters

`-help`	Prints a brief description that includes type and default information for each `createRuler` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man createRuler`
`-center {x y}`	Specifies the coordinates for the center of a circular ruler.
`-coordinates {x1 y1 x2 y2 ...}`	Specifies the beginning and ending coordinates for the ruler line segments. The values are in microns.
`-radius value`	Specifies the radius of a circular ruler. The value is of type float.

Example

- The following command creates a circular ruler of radius 500 with the center at `{0 0}`:

  ```
  createRuler -center {0 0} -radius 500
  ```

createSnapshot

```
createSnapshot
[-help]
-dir string
-name string
[-overwrite]
```

Creates snapshots of the design for all three views (Floorplan, Amoeba, and Placement) at any stage of the design flow. The command creates GIF images, for all the design views, on the same scale as can be seen in the software. It can also save QoR parameters like WNS,TNS, Placement Overlap, and Congestion at any stage of the design flow. Once the snapshot is created, you can view it using `viewSnapshot`.

Parameters

`-help`	Prints a brief description that includes type and default information for each `createSnapshot` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man createSnapshot`.
`-dir` *`string`*	Specifies the directory in which you want to save the snapshot.
`-name` *`string`*	Specifies the name of snapshot and the files will be created, like `ss_string_view.gif` for all three views.
`-overwrite`	Overwrites the existing snapshot with new one.

Note: This command will not work in the `-nowin` mode.

Examples

- The following command will create a design snapshot in the directory `/work/user1`. Before creating the snapshot, it will create the following files:
  - `ss_cts.fplan.gif` for floorplan view

  - `ss_cts.amoeba.gif` for amoeba view
  - `ss_cts.place.gif` for place view

    ```
    createSnapshot -dir /work/user1 -name cts
    ```

- The following command will create a snapshot under the name `cts`. If there exists a snapshot under this name in the directory `/work/user1`, it will overwrite it.

  ```
  createSnapshot -dir /work/user1 -name cts -overwrite
  ```

createUserBundleNet

```
createUserBundleNet
[-help]
name
-nets listOfNets
-object1 string
-object2 string
```

Creates a bundle of specified nets that can be displayed as flightlines. Bundled nets help you with data flow analysis before and after layout. Net bundles can be created and viewed in floorplan and amoeba views. Each custom net bundle displays the number of nets in it and works for macros, blobs, and giudes.

Using `createUserBundleNet`, you can create custom bundled nets that allow you to define your own net bundles as per your requirements. This is useful while debugging physical properties of interconnects within a complicated hierarchical design because you can define start and end points of a net bundle. As a result, you can create and display only relevant flightlines, instead of looking at all the flightlines of specified nets.

Note: One net can be part of multiple net bundles simultaneously.

You can display flightline net bundles using the `displayUserBundleNet` command and delete them using the `deleteUserBundleNet` command.

Note: You can choose to display flightlines for only bundled nets by using the *Show Net Bundle FlightLine Only* option in the Preferences form. If this option is not selected, the net bundle flightlines are displayed along with other selection-based flightlines by default.

Parameters

`-help`	Prints a brief description that includes type and default information for each `createUserBundleNet` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man createUserBundleNet`
`name`	Specifies the name of the custom net bundle.
`-nets` *`listOfNets`*	Specifies the list of nets to be included in the net bundle. You can use patterns with wildcards to specify net names. All the nets that match the specified pattern are put in the same bundle.
`-object1` *`string`*	Specifies the name of object which is the start point of the nets. The object type includes module, block, black box, and IO pad.
`-object2` *`string`*	Specifies the name of object which is the end point of the nets. The object type includes module, block, black box, and IO pad.

Examples

- The following command creates a bundle called `bundle_1`, which contains flightlines of nets `net_1` and `net_2`:

  ```
  createUserBundleNet bundle_1 -nets {net_1 net_2} -object1 Module1 -object2 Module2
  ```

  You can then use the `displayUserBundleNet` command to display `bundle_1` flightlines as follows:

  ```
  displayUserBundleNet -netBundle bundle_1
  ```

Related Information

- `displayUserBundleNet`
- View Menu chapter of the *Menu Reference*
    - *Preferences - Flightline*

db_browser

```
db_browser
[-help]
obj_list | head | top | selected
```

Launches the database browser (DB Browser). The DB browser returns information about one of the following:

- Specified object list
- Root of the database
- Top cell of the design
- Selected object

Parameters

`-help`	Prints a brief description that includes type and default information for each `db_browser` parameter. For a detailed description of the command and all of its parameters, use the man command: `man db_browser`
`obj_list` | `head` | `top` | `selected`	Specifies the objects whose attributes need to be displayed in the browser: • *`obj_list:`* Displays attributes of the list of specified objects in the browser. Use the *Show next object in list* and the *Show last object in list* buttons in the browser to traverse through the list. • `head`: Displays technology information about the root of the database in the browser. • `top`: Displays attributes of the top cell of the design in the browser • `selected`: Displays attributes of the objects you have selected in the main window. Use the *Show next object in list* button in the DB Browser to move to the next object in the sequence.

Examples

- The following command launches the DB Browser and returns attributes of the top cell of the design.

```
db_browser top
```

    - DB Browser

dehighlight

```
dehighlight
[-help]
[objectList]
[-all | -index indexValue | -original | -select]
```

Removes highlights from all the highlighted objects at any stage of the design flow. You can choose to dehighlight all objects, selected objects, objects highlighted with original color, or objects with specified index values.

Parameters

`-help`	Prints a brief description that includes type and default information for each `dehighlight` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man dehighlight`
`-all`	Specifies that all objects will be dehighlighted.
`-index` *`indexValue`*	Specifies that the objects with the index value provided will be dehighlighted. The index value is the value of the Highlight Set as specified through the *Edit - Highlight Selected* menu or through the `highlight` command. The *Edit - Highlight Selected* menu provides eight highlight patterns to choose from. The value of index should, therefore, be a number be from 1 to 8. As an example, if you specify a value of 3 for index, all objects that are highlighted as Highlighted Set 3 will be dehighlighted.
`objectList`	Specifies the object pointer list for dehighlighting.
`-original`	Specifies that the objects highlighted with original color should be dehighlighted.
`-select`	Specifies that all selected objects should be dehighlighted.

Examples

- The following command dehighlights all highlighted objects.

  ```
  dehighlight
  ```

- The following command dehighlights all highlighted objects that have been highlighted as Highlight Set 4 through the Edit - Highlight Selected menu or through the `highlight` command.

  ```
  dehighlight -index 4
  ```

- The following command dehighlights all highlighted objects that are currently selected in the display window.

  ```
  dehighlight -select
  ```

delete_gui_object

```
delete_gui_object
[-help]
[-shape | -text | -marker | -all | -selected ]
```

Deletes specified or selected GUI objects.

Parameters

`-help`	Prints out the command usage. For a detailed description of the command, use the `man` command: `man delete_gui_object`
`-all`	Deletes all GUI objects.
`-marker`	Deletes GUI markers.
`-selected`	Deletes selected GUI objects.
`-shape`	Deletes GUI shapes.
`-text`	Deletes GUI text.

Related Information

- `add_gui_marker`
- `add_gui_shape`
- `add_gui_text`

deleteUserBundleNet

```
deleteUserBundleNet
[-help]
name
```

Deletes the specified flightline net bundle. If a net is part of multiple net bundles and you delete one of the net bundles, other net bundles containing the net are not affected.

You can create flightline net bundles using the `createUserBundleNet` command and display them using the `displayUserBundleNet` command.

Note: `deleteUserBundleNet` removes the specified net bundle. If you want to retain the net bundle but just want to clear its flightlines from the display area, use the `-remove` option of `displayUserBundleNet` instead.

Parameters

`-help`	Prints a brief description that includes type and default information for each `deleteUserBundleNet` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man deleteUserBundleNet`
`name`	Specifies the name of the flightline net bundle to be removed.

Examples

- The following command deletes the flightline net bundle `bundle_1`:

  ```
  deleteUserBundleNet bundle_1
  ```

Related Information

- `createUserBundleNet`
- `displayUserBundleNet`
- View Menu chapter of the *Menu Reference*
    - *Preferences - Flightline*

deleteWorkspace

```
deleteWorkspace
[-help]
-name workspaceName
[-dir directory]
```

Deletes the specified workspace. Use this command at any stage in the design flow to remove a workspace that you do not need any longer.

Parameters

`-help`	Prints a brief description that includes type and default information for each `deleteWorkspace` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man deleteWorkspace`
`-name` *`workspaceName`*	Specifies the name of the workspace to be deleted.
`-dir` *`directory`*	Specifies the directory from which the workspace is to be deleted. The default search order to access directories for deleting workspaces is as below: • Current working directory • User home directory

Example

The following example deletes the `Test` workspace from the current working directory.

```
deleteWorkspace -name Test
```

Related Information

- `loadWorkspace`
- `saveWorkspace`
- `setDefaultWorkspace`
- Windows Menu chapter of the *Menu Reference*
    - *Workspaces*

deselectModule

```
deselectModule
[-help]
name
```

Deselects the specified module.

Parameters

`-help`	Prints a brief description that includes type and default information for each `deselectModule` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man deselectModule`
name	Specifies the name of the module to be deselected.

Example

The following example deselects the `DTMF_INST` module.

```
deselectModule DTMF_INST
```

Related Information

- `selectModule`

deselectPin

```
deselectPin
[-help]
name
```

Deselects the specified pin.

Parameters

`-help`	Prints a brief description that includes type and default information for each `deselectPin` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man deselectPin`
`name`	Specifies the name of the pin to be deselected.

Example

The following example deselects the `swack` pin.

```
deselectPin swack
```

Related Information

- `selectPin`

display_temperature_result

```
  display_temperature_result
[-help]
-layer <string>
-reset
```

Displays the tile-based temperature map file generated by Sigrity Celsius.

Parameters

`-help`	Outputs the command usage and a brief description about the command parameters.
`-layer <string>`	Displays the temperature map for the specified layer. **Example**: `display_temperature_result -layer Metal6`
`-reset`	Resets the temperature map display.

displayUserBundleNet

```
displayUserBundleNet
[-help]
[-keepExisting]
-netBundle bundleName
[-remove]
```

Displays flightlines for the specified net bundle. Bundled nets help you with data flow analysis before and after layout. Net bundles can be created and viewed in floorplan and amoeba views. When you run the `displayUserBundleNet` command, the software switches automatically to the net bundle mode and clears flightlines based on selection.

You can create flight line net bundles using the `createUserBundleNet` command and delete them using the `deleteUserBundleNet` command.

Note: When selecting objects, you can choose to display flightlines for only bundled nets by using the *Only Show Net Bundle Flight Line* option in the Preferences form. If this option is not selected, the net bundle flightlines are displayed along with other flightlines.

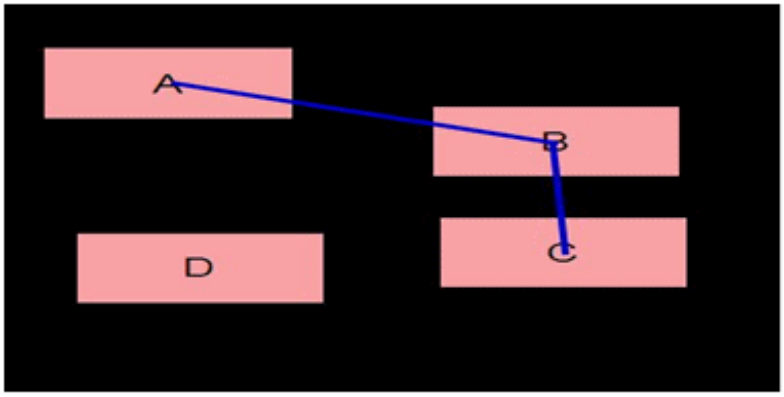
Parameters

`-help`	Prints a brief description that includes type and default information for each `displayUserBundleNet` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man displayUserBundleNet`
`-keepExisting`	Retains existing net bundle flightlines while displaying the flightline of specified net bundles. If this option is not specified, the command clears existing flightlines before displaying specified net bundle flightlines.
`-netBundle` *`bundleName`*	Specifies the name of the net bundle whose flightlines you want to display. You can specify more than one net bundle.
`-remove`	Clears flightlines of specified net bundle from the display area. If no net bundle name is specified, all flightlines based on net bundles are removed. **Note:** This option only clears the flightlines of the net bundle from the display area. If you want to remove the net bundle itself, use the `deleteUserBundleNet` command.

Examples

- The following command displays flightlines of the net bundle `bundle_1`. Here, `bundle_1` contains `net_1`, which is just between A and B, and `net_2`, which is just between B and C:

  ```
  displayUserBundleNet -netBundle bundle_1
  ```

- The following command displays flightlines of the net bundle `bundle_2` while retaining flightlines of `bundle_1`. Here, `bundle_2` contains `net_3`, which is among B, C, and D:

  ```
  displayUserBundleNet -netBundle bundle_2 -keepExisting
  ```

  
  Note: The same flightlines could also be displayed in a single step by using the following command:

  ```
  displayUserBundleNet -netBundle {bundle_1 bundle_2}
  ```

Related Information

- `createUserBundleNet`
- `deleteUserBundleNet`
- View Menu chapter of the *Menu Reference*
    - *Preferences - Flightline*

dumpPictures

```
dumpPictures
[-help]
-dir string
[-fullScreen]
-prefix string
```

Dumps images at various stages of the Innovus flow (such as congestion map, cell density map, floorplan view, colored hierarchy map), when executed in batch mode. This command dumps the following images in the specified directory in the `.gif` format:

1. `ctd`
2. `congestion`
3. `density`
4. `floor`
5. `placement`
6. `route_all`
7. `route_C4`
8. `route_C5`
9. `route_C6`
10. `route_M1`
11. `route_M2`
12. `route_M3`
13. `specialroute`
14. `violations`

Parameters

`-help`	Prints a brief description that includes the type and default information for each `dumpPictures` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man dumpPictures`
`-dir` *`string`*	Specifies the output directory.
`-fullScreen`	Maximizes the window.
`-prefix` *`string`*	Specifies the file prefix.

Example

The following command dumps the full screen images at the various stages of the Innovus flow to the `TEST` directory:

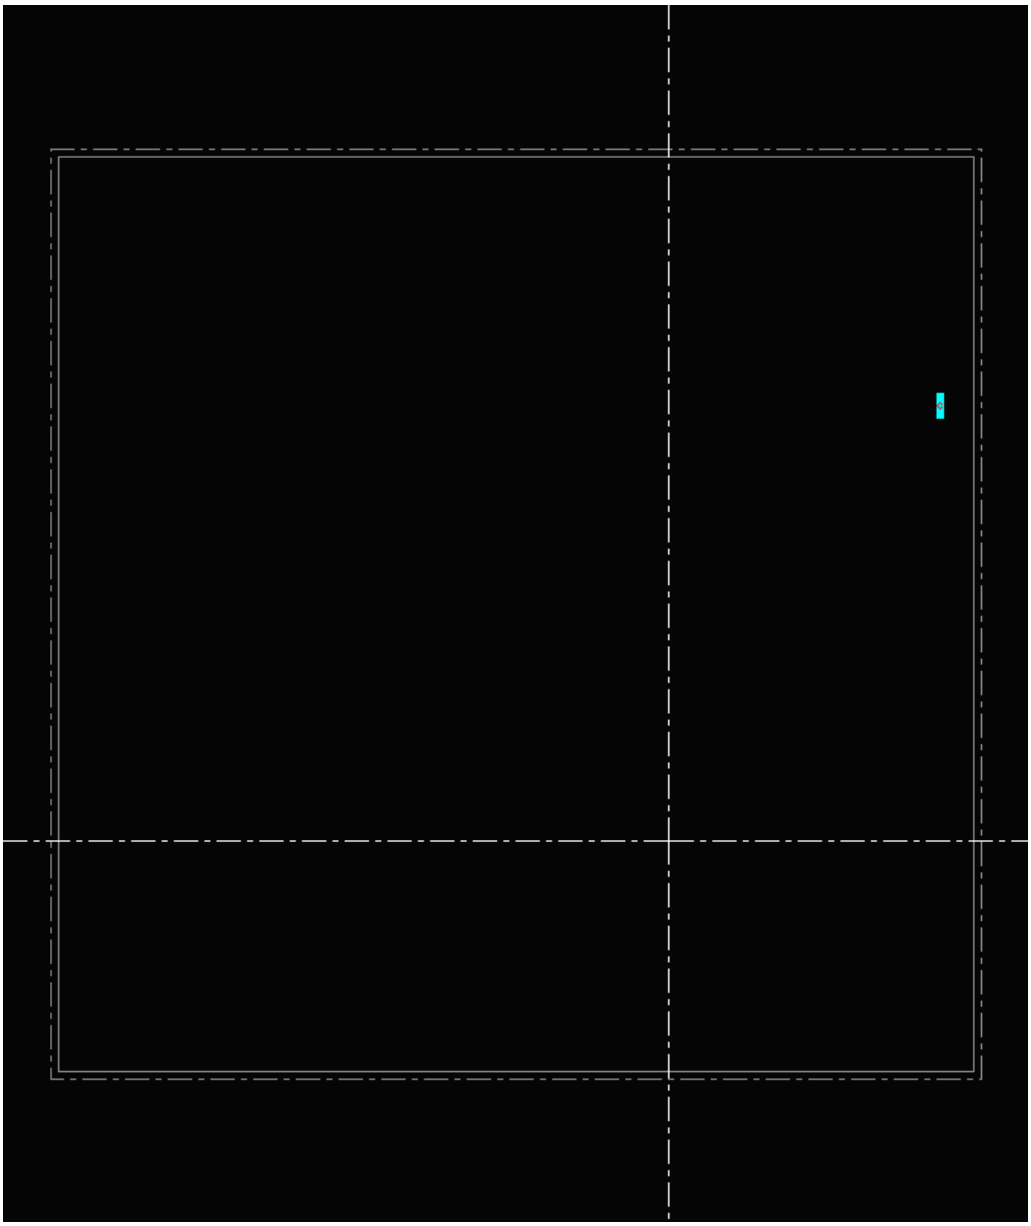
```
dumpPictures -dir TEST -prefix [dbGet top.name] -fullScreen
```

The following images are dumped in the `TEST` directory:

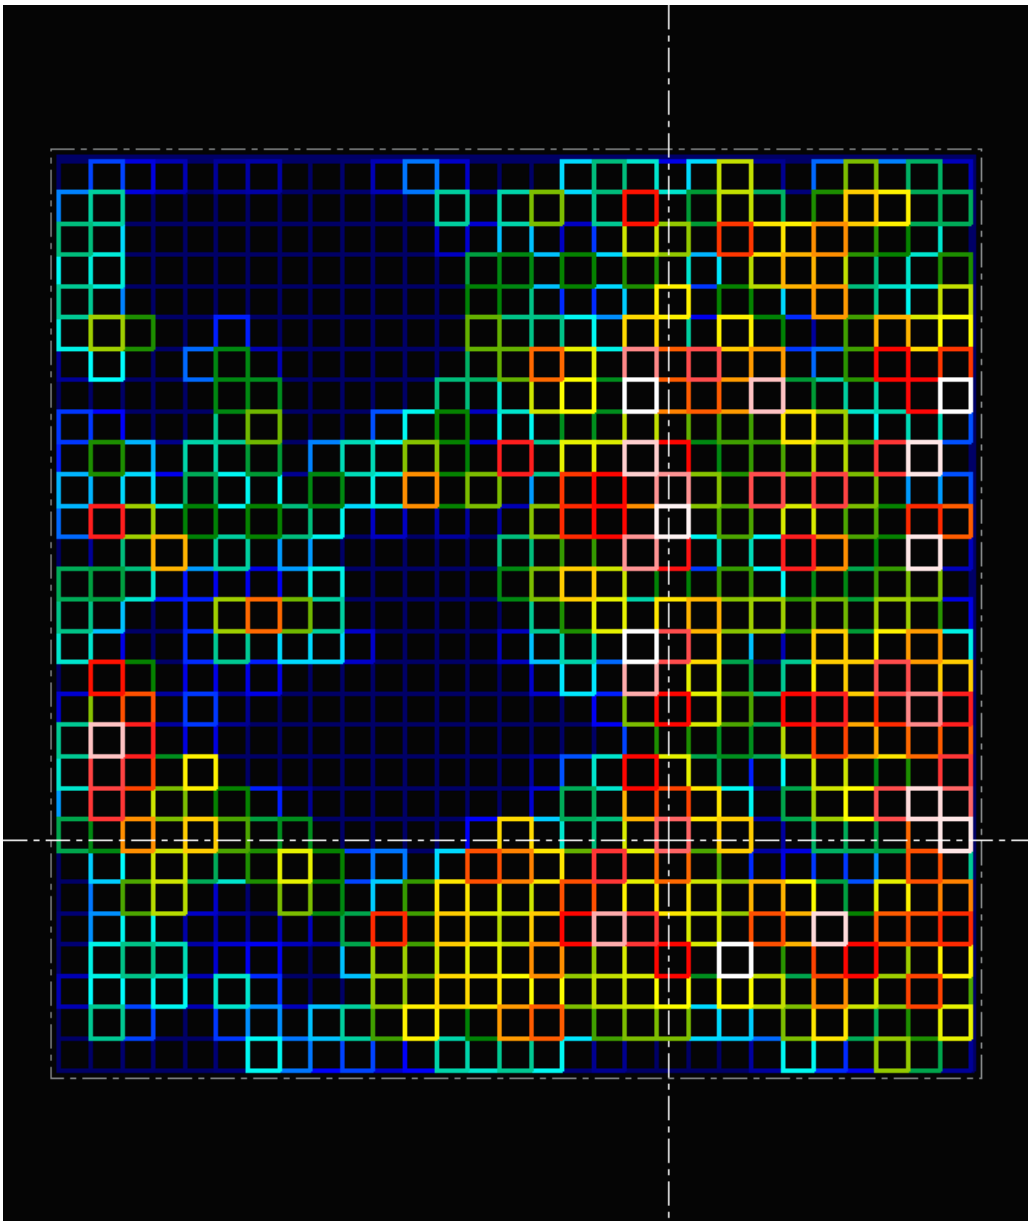
1. `congestion`
2. `density`
3. `floor`
4. `placement`
5. `route_all`
6. `route_C4`
7. `route_C5`
8. `route_C6`
9. `route_M1`
10. `route_M2`

11. `route_M3`
12. `specialroute`
13. `violations`

Following is the `congestion` image:



Following is the `density` image:



Related Information

- createSnapshot
- dumpToGIF
- gui_dump_picture

dumpToGIF

```
dumpToGIF
[-help]
filename
[-honor_umask]
```

Saves a snapshot of the current screen to a GIF file with the specified name in the current directory. You can use this command at any stage of the design flow.

Parameters

`-help`	Prints a brief description that includes type and default information for each `dumpToGIF` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man dumpToGIF`.
`filename`	Specifies the name of the output file as a string.
`-honor_umask`	Honors the umask settings while saving the GIF file. If you specify this option, the permission of the saved GIF file will be set by subtracting the umask value from the full permission value. For example, if the full permission setting of a file is `0666` and the umask setting is `0022`, the tool saves the GIF file with the permission setting of `0666 - 0022`, that is `0644`.

Example

The following example captures the current screen and saves it to *`test1.gif`* in the current directory.

```
dumpToGif test1.gif
```

Related Information

- `createSnapshot`
- `dumpPictures`

editCopy

```
editCopy
[-help]
[-objects string]
[-orientation {R0 R90 R180 R270 MX MX90 MY MY90}]
[-net net_name | -net_group string | -keep_net_name]
[-rotate_point {x y} | -times integer]
[-rotate_point {x y} | [dx dy ]]
```

Copies selected or specified objects to the specified location. In the current release, the command supports the copying of bus guides, regular wires and vias, special wires and vias, as well as patch wires. When `setEditMode -snap_objects_to_track regular` (or `special` or `patch`) is set before using `editCopy`, copied wires of that type are snapped to track.

Note: Use the `copyObject` and `pasteObject` commands to copy placement and routing blockages.

Parameters

`-help`	Prints a brief description that includes type and default information for each `editCopy` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man editCopy`
dx	Specifies the dx distance to move the object copy in microns.
dy	Specifies the dy distance to move the object copy in microns.
`-keep_net_name`	Specifies that the net name from the original object should be retained after copying.

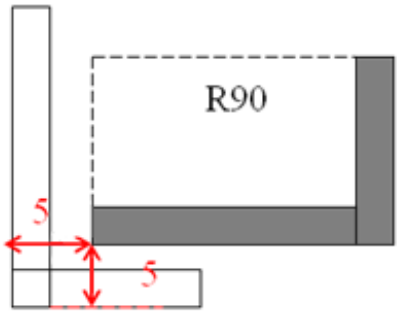
`-net` *net_name*	Specifies the net to which the copied object should be assigned. If neither `-net` nor `-keep_net_name` is specified and: • The copied wire connects to a single wire, the tool assigns the single wire's net to the copied wire. • The copied wire connects to multiple wires on the same net, the tool assigns the net to the copied wire. • The copied wire connects to multiple wires on different nets, the tool assigns `_NULL` to the copied wire and displays the following message: `**WARN: (IMPSPR-304): One target route connects to more than one routes on different nets, net for the target route might not be correctly assigned. Undo and try again to pick a proper location.`
`-net_group` *string*	Assigns the specified net group name to the new copy of the bus guide. You can specify only one net group name with the `-net_group` parameter. If the net group name you specify does not exist, the tool does not copy the bus guide and issues an error message. If you copy a bus guide without the `-net_group` parameter, the new bus guide retains the net group name of the original bus guide. Note that the `-net_group` parameter cannot be used for wires or vias. If you use it for copying a wire or via, the tool ignores the setting but continues the copy operation with a warning. Similarly, the `-net` and `-keep_net_name` parameters do not work for bus guides. If you copy a bus guide with `-net` or `-keep_net_name`, the tool ignores the settings, issues a warning, and copies the bus guide with the original net group name.
`-objects` *string*	Specifies the object pointers to be copied.
`-orientation {R0 R90 R180 R270 MX MX90 MY MY90}`	
	Specifies the orientation of object copy after pasting. Use this parameter to rotate the selected wire or via during copy/paste. For values `R0`, `R90`, `R180`, and `R270`, the wire or via is rotated by specified degrees around the lower left point. For values `MX`, `MX90`, `MY`, and `MY90`, the bounding box is mirrored.
`-rotate_point {x y}`	

	Rotates the copied wire(s) around the specified point `{x y}`, when specified along with the `-orientation` parameter. If the `-rotate_point` parameter is not specified, the copied wires are rotated by default around the lower-left corner of the bounding box of the original wires. If you specify the `-rotate_point` parameter without the `-orientation` parameter, the tool copies the object at the same location. This is the same as specifying the `-orientation {R0}` option. **Note**: The `-rotate_point` parameter cannot be used with the `-times` parameter.
`-times` *integer*	Specifies the number of times the object is to be copied. For example, if you specify 3, the selected wire is copied thrice. The distance between different copies of the wire is equal to the distance between the original wire and the first copy. If you move the first copy, the other copies are moved by the same distance:  **Note**: If DRC checking is turned on with `setEditMode -drc_on true`, all copied wires obey the DRC rules.

Examples

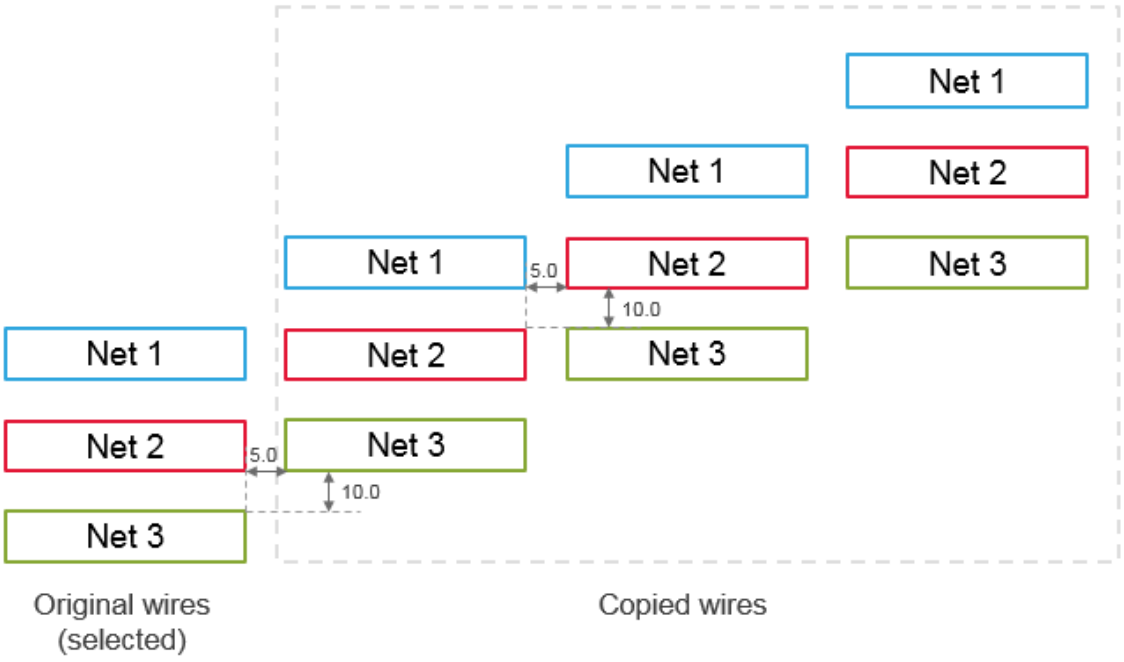
- The following command copies the specified wire 5 microns up and to the right of the original and rotates the wire by 90 degrees around the lower left corner:

  ```
  editCopy 5 5 -orientation R90 -objects wire_pointer
  ```



- The following command copies the selected wires 3 times and the distance between each copy set is as specified:

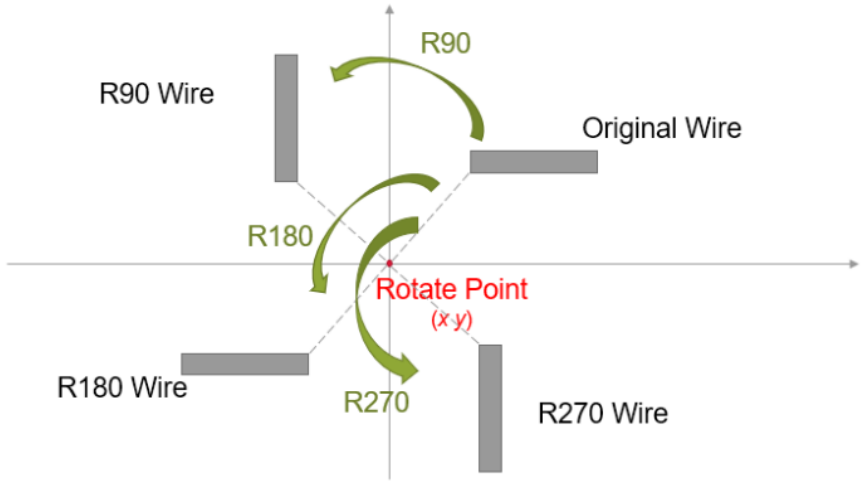
  ```
  editCopy 5.0 10.0 -times 3 -keep_net_name
  ```



- The following commands rotate the new copy of the selected wire by 90, 180, and 270 degrees, respectively, around the specified rotation point, *x y*:

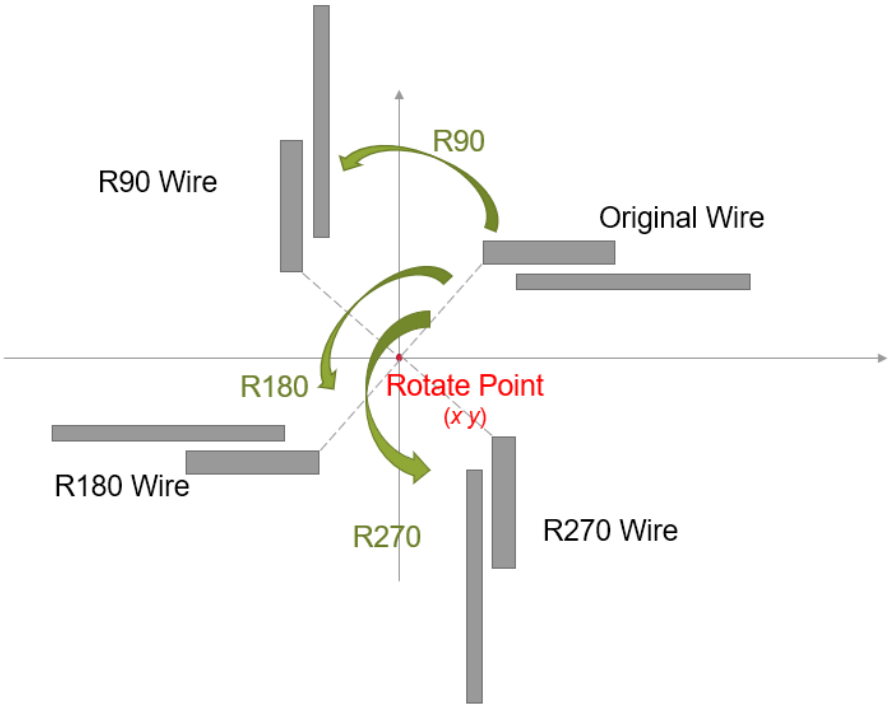
  ```
  editCopy -orientation R90 -rotate_point x y
  editCopy -orientation R180 -rotate_point x y
  ```

```
editCopy -orientation R270 -rotate_point x y
```



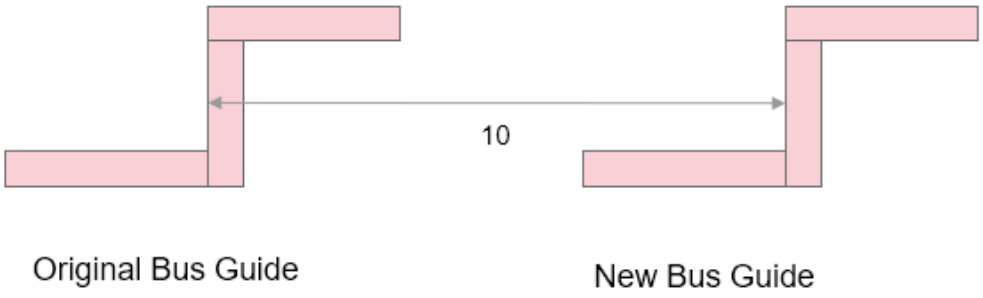
- The following commands rotate the new copy of the selected group of wires by 90, 180, and 270 degrees, respectively, around the specified rotation point, `x y`:

```
editCopy -orientation R90 -rotate_point x y
editCopy -orientation R180 -rotate_point x y
editCopy -orientation R270 -rotate_point x y
```



- The following command copies the selected bus guide 10 microns to the right of the original:

```
editCopy 10 0
```



- The following command copies the selected bus guide 10 microns to the right of the original and assigns the net group `B` to the copy:

```
editCopy 10 0 -net_group B
```

fit

```
fit [-help]
```

Fits the entire design in the viewable window. You can use this command at any stage of the design flow to view the design in entirety.

Parameters

`-help`	Prints a brief description of the `fit` command. For a detailed description of the command, use the `man` command: `man fit`.

Related Information

- `zoomIn`
- `zoomOut`
- View Menu chapter of the *Menu Reference*

get_visible_bumps

```
get_visible_bumps
[-help]
```

Returns all visible bump cells in the design if some bumps have been hidden in the design.

Parameters

`-help`	Prints a brief description that includes type and default information for each `get_visible_bumps` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man get_visible_bumps`

Examples

- The following command returns the name of all visible bumps in the designs:
  ```
  innovus 17> get_visible_bumps
  ```

Related Information

- `set_visible_bumps`

get_visible_netGroups

```
get_visible_netGroups
[-help]
```

Returns the names of the visible netGroups if some netGroups have been hidden in the design. If all netGroups are visible, this command has no effect.

Parameters

`-help`	Prints a brief description that includes type and default information for each `get_visible_netGroups` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man get_visible_netGroups`

Examples

- The following command returns the name of all visible netGroups in the designs:

  ```
  innovus 17> get_visible_netGroups
  test_ng
  ```

Related Information

- `set_visible_netGroups`

get_visible_nets

```
get_visible_nets
[-help]
```

Returns the names of the visible nets if some nets have been hidden in the design. If all nets are visible, this command has no effect.

Parameters

`-help`	Prints a brief description that includes type and default information for each `get_visible_nets` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man get_visible_nets`

Examples

- The following command returns the name of all visible nets in the designs:

```
innovus 17> get_visible_nets
ram1/subram02_lower/TESTACT_INST_PERIWDSRAM001PAA512W27C3/tpo_a_9_
```

Related Information

- `set_visible_nets`

gui_attach_to_cursor

```
gui_attach_to_cursor
[-help]
[ -selected  | objects ]
```

Attaches selected or specified objects to the cursor. The use model is as follows:

1. Select the object(s) to be moved by using the `gui_attach_to_cursor` command.
2. Zoom into the location where you want to place the object(s).
3. Click at the required location to place the selected object(s) there.

This command is useful during floorplanning when you may need to move multiple objects into the same zoomed in area.

Parameters

`-help`	Prints a brief description of the `gui_attach_to_cursor` command. For a detailed description of the command, use the `man` command: `man gui_attach_to_cursor`.
`objects`	Specifies the object pointer list.
`-selected`	Attaches the selected objects to the cursor.

Example

The following command attaches objects `A` and `B` to the cursor:

```
gui_attach_to_cursor {A B}
```

Now, move the cursor to the layout and click at the desired location to place objects `A` and `B` there.

gui_close_cell_view

```
gui_close_cell_view [-help]
```

Closes the Cell Viewer.

If the Cell Viewer is open at any stage of the design flow, you can use the `gui_close_cell_view` command to close it.

Parameters

`-help`	Prints a brief description of the `gui_close_cell_view` command. For a detailed description of the command, use the `man` command: `man gui_close_cell_view`.

Related Information

- `gui_open_cell_view`

gui_deselect

```
gui_deselect
[-help]
{-all  |
-rect {x1 y1 x2 y2} |
-point {x y} |
-line {x1 y1 x2 y2}}
```

Deselects objects as per the parameters you specify. If `-all` is specified, deselects all selected objects.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_deselect` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_deselect`
`-all`	Deselects all objects.
`-line {x1 y1 x2 y2}`	Deselects objects through which the specified line passes.
`-point {x y}`	Deselects objects at the specified point.
`-rect {x1 y1 x2 y2}`	Deselects objects within the specified box coordinates.

gui_dim_foreground

```
gui_dim_foreground
[-help]
-lightness_level {default medium dark}
```

Dims the display area to the specified level. Use this command to view selected and highlighted objects clearly against the dimmed foreground. This command is especially useful when you are debugging.

The equivalent bindkey is F12.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_dim_foreground` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_dim_foreground`.
`-lightness_level {default medium dark}`	
	Specifies the brightness level of the foreground in the display area.

gui_dump_picture

```
gui_dump_picture
[-help]
filename
[-format {BMP GIF JPG JPEG PNG PBM PGM PPM XBM XPM}]
[-honor_umask]
[-width integer_value -height integer_value]
[-window string]
```

Saves a snapshot of the layout or specified window with the specified name in the current directory. You can specify the size as well as the format in which you want to save the snapshot. The command also prints out overlay maps with legends.

You can use this command at any stage of the design flow.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_dump_picture` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_dump_picture`

`filename`	Specifies the name of the picture file as a string. You can specify the file extension as well.
	
	Note: The file extension you specify does not control the format of the picture. The picture file is dumped in the PNG format by default or the format you explicitly specify with `-format`. For example, the following command saves the `testShot` picture file in the PNG format:
	`innovus 34> gui_dump_picture testShot.gif`
	
	`current_directory``@file testShot.gif`
	`testShot.gif: PNG image data, 540 x 688, 8-bit/color RGB, non-interlaced`

`-format {BMP GIF JPG JPEG PNG PBM PGM PPM XBM XPM}`	

	Specifies the format of the picture file. *Default*: PNG
`-height` *integer_value*	
	Specifies the height of the picture as an integral value. **Note**: The `-width` parameter is required when `-height` is specified. *Min*: 100 *Max*: 20000
`-honor_umask`	Honors the umask settings while saving the picture. If you specify this option, the permission of the saved picture file will be set by subtracting the umask value from the full permission value. For example, if the full permission setting of a file is `0666` and the umask setting is `0022`, the tool saves the picture file with the permission setting of `0666` - `0022`, that is `0644`.
`-width` *integer_value*	
	Specifies the width of the picture as an integral value. **Note**: The `-height` parameter is required when `-width` is specified. *Min*: 100 *Max*: 20000
`-window` *string*	Specifies the ID of the window that you want to dump. You can use the following IDs: • For Layout Viewer: `designview.win` • For Cell Viewer: `.uiCellView.win` If `-window` is not specified, the layout window is dumped out by default.

Examples

- The following command captures the layout window and saves it in the default PNG format with the name *test2* and the dimensions 1000 x 1000 in the current directory:

  ```
  gui_dump_picture test2 -width 1000 height 1000
  ```

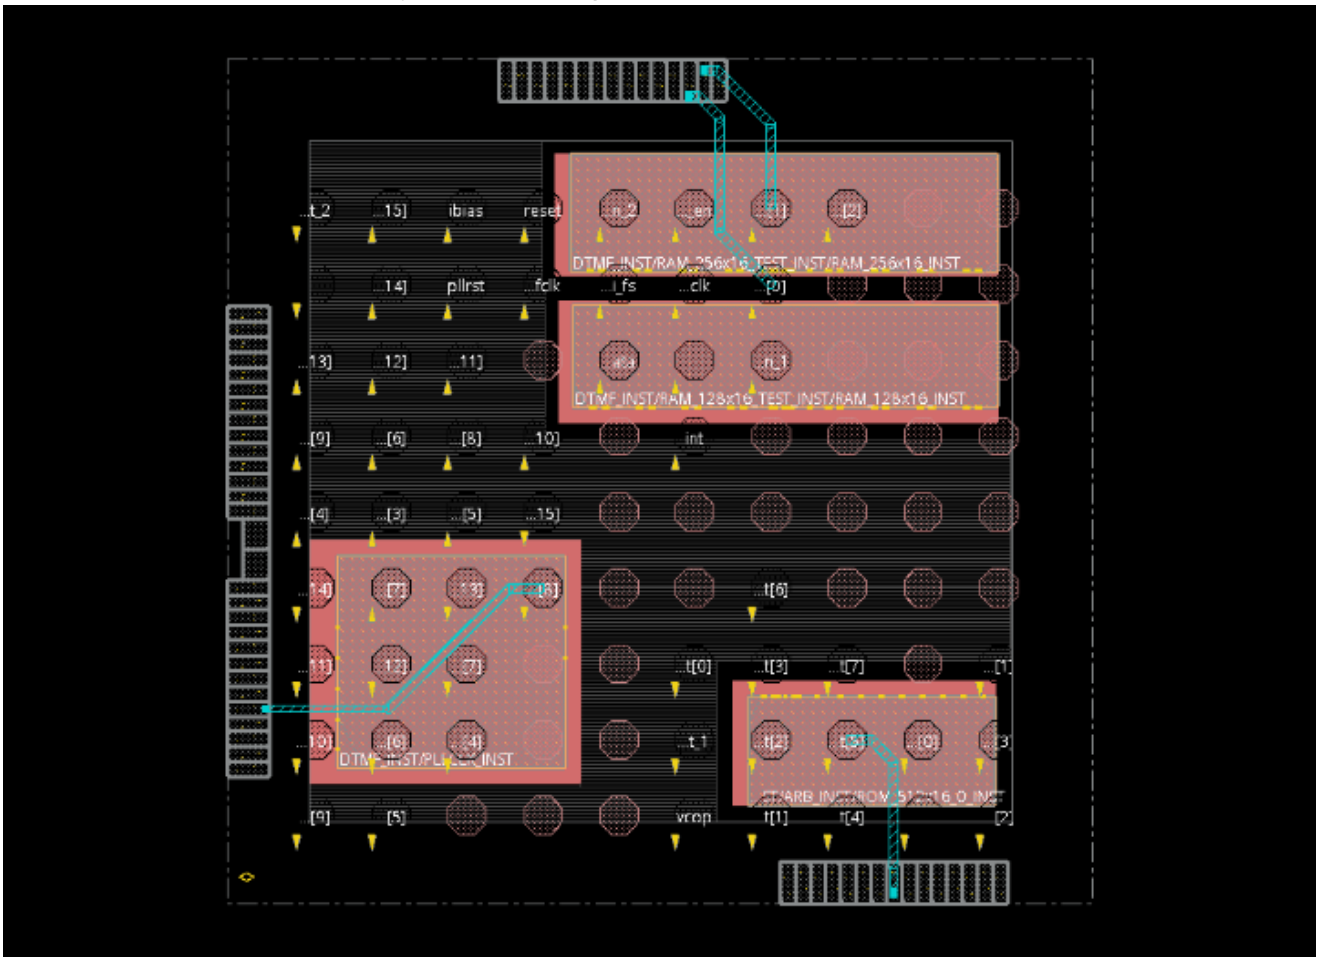
- The following command captures the layout window and saves it in the GIF format with the name *test1.gif* in the current directory:

  ```
  gui_dump_picture -format GIF test1.gif
  ```

- The following command captures the layout viewer window and saves it in PNG format with the name testShot.png in the current directory:

  ```
  gui_dump_picture testShot.png -window designview.win
  ```

  Note: You must have the layout viewer open.



- The following command captures the view in the cell viewer window and saves it in PNG format with the name testCell.png in the current directory:

```
gui_dump_picture testCell.png -window .uiCellView.win
```

gui_group_hinst

```
gui_group_hinst
[-help]
[-type {flex_model} | hname]
```

Moves one level up the hierarchy for the specified module guide and displays the next module. The `gui_group_hinst` command is equivalent to the *Group* widget on the toolbar.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_group_hinst` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_group_hinst`
`hname`	Specifies the name of the hierarchical instance to be grouped.
`-type {`*`flex_model`*`}`	Specifies the type of objects to be grouped. At present, only the `flex_model` type is supported.

Examples

- The following command goes one level up the specified module:
  ```
  gui_group_hinst DTMF_INST/TDSP_CORE_INST
  ```
- The following command groups all flexModels, including flex_module and flex_instgroup, up to the partition or instance group level.
  ```
  gui_group_hinst -type flex_model
  ```

Related Information

- gui_ungroup_hinst
- The Main Window chapter in *Menu Reference*

gui_open_cell_view

```
gui_open_cell_view [-help]
```

Opens the Cell Viewer. The Cell Viewer provides a convenient way to view the content of a cell, cell view, or partition without having to zoom into the design. It provides an artwork window for viewing the following objects:

- any LEF library cell
- any via cell
- any OpenAccess database cell view
- abstract view of any partition in the design
- power grid view

You can use the `gui_open_cell_view` command at any stage of the design flow.

Parameters

`-help`	Prints a brief description of the `gui_open_cell_view` command. For a detailed description of the command, use the `man` command: `man gui_open_cell_view`.

Related Information

- `gui_close_cell_view`
- Tools Menu chapter of the *Menu Reference*
  - *Cell Viewer*

gui_report_trace_flightline

```
gui_report_trace_flightline
[-help]
-file report_name
```

Saves information about the all flightlines traced through the `gui_trace_flightline` command to the specified file.

Parameters

`-help`	Prints a brief description of the `gui_report_trace_flightline` command. For a detailed description of the command, use the `man` command: `man gui_report_trace_flightline`.
`-file` *report_name*	Specifies the name of the report file.

Example

The following set of commands reports all traced flightlines:

```
innovus 3> gui_trace_flightline -inst  DTMF_INST/DMA_INST/present_state_reg_3 -sink -
sink_level 2 -sink_color pink
innovus 4> gui_trace_flightline -inst DTMF_INST/RESULTS_CONV_INST/r852_reg_5 -sink -
sink_level 2 -sink_color green
innovus 5> gui_report_trace_flightline -file file1
```

```
The tool saves the report as follows:
```

```

gui_save_flightline

```
gui_save_flightline
[-help]
-file file_name
[-netWindow]
```

Saves the flightline information of the selected instance to the specified file.

Parameters

`-help`	Prints a brief description of the `gui_save_flightline` command. For a detailed description of the command, use the `man` command: `man gui_save_flightline`.
`-file file_name`	Specifies the name of the file in which the flightline information will be saved.
`-netWindow`	Saves the contents of the Flightline Net Window.

Example

The following command saves the flightline information to a file named `flight1`:

```
gui_save_flightline -file flight1
```

Here's a sample report:

gui_schematic_load_view

```
gui_schematic_load_view
[-help]
-file file_name
[-name name]
```

Loads the specified schematic file.

⚠ This commands work only in the cone view (flattened mode).

Parameters

`-help`	Prints a brief description of the `gui_schematic_load_view` command. For a detailed description of the command, use the `man` command: `man gui_schematic_load_view`.
`-file` *`file_name`*	Specifies the name of the schematic file to be loaded.
`-name` *`name`*	Specifies a unique window name for the opened schematic view.

Related Information

- `gui_schematic_save_view`

gui_schematic_save_view

```
gui_schematic_save_view
[-help]
-file file_name
[-name string]
```

Saves the current schematic view into the specified file.

⚠ This commands work only in the cone view (flattened mode).

Parameters

`-help`	Prints a brief description of the `gui_schematic_save_view` command. For a detailed description of the command, use the `man` command: `man gui_schematic_save_view`.
`-file` *`file_name`*	Specifies the name of the file in which to save the schematic view.
`-name` *`string`*	Specifies the name of the schematic view.

Related Information

- `gui_schematic_load_view`

gui_select

```
gui_select
[-help]
{-point {x y} |
-line {x1 y1 x2 y2} |
-rect {x1 y1 x2 y2}}
[-toggle  | -append  | -next]
[-point {x y} [-next ]]
```

Selects objects as per the parameters you specify. Use `-point` to select the object at the specified coordinate, `-line` to select the objects through which the specified line passes, or `-rect` to select the objects falling within the specified box coordinates.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_select` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_select`
`-append`	Appends to the existing selection. This is equivalent to pressing the `Shift` key while selecting an object using the GUI.
`-line {x1 y1 x2 y2}`	Selects by line. Use this parameter to select the objects through which the specified line passes.
`-next`	Steps to next object under point. This is same as using space bar while selecting an object using the GUI.
`-point {x y}`	Selects the object at the specified point.
`-rect {x1 y1 x2 y2}`	Selects by box. Use this parameter to select the objects falling within the specified rectangular area.
`-toggle`	Toggles the selection. This is equivalent to pressing the `Ctrl` key while selecting an object using the GUI.

Examples

- The following command selects the objects that are totally enclosed within the box defined by the coordinates (`x = 10, y = 200`) and (`x = 100, y = 50`):
  ```
  gui_select -rect {10 200 100 50}
  ```
- The following command selects all the objects falling across the specified line coordinates:
  ```
  gui_select -line {168.654 994.049 688.129 436.224}
  ```
- The following command selects the objects crossed by the specified line and appends them to the current selection:
  ```
  gui_select -line {169.622 996.049 698.290 446.240} -append
  ```
- The following command toggles the selection on the objects in the specified bounding box. If the objects are previously selected, the command deselects them and vice versa:
  ```
  gui_select -rect {10 200 100 50} -toggle
  ```

gui_show_edge_number

```
gui_show_edge_number [-help]
[-objects string]
[-reset]
```

Displays edge numbers on the sides of the selected or specified objects in the GUI. Currently, you can display edge numbers on partitions and blocks. This feature is useful if you need to indicate the partition or block edge number in your script.

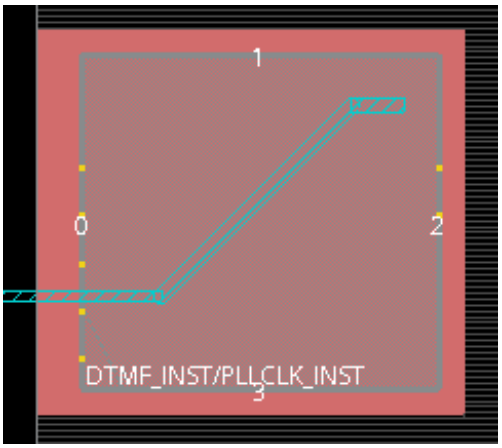
Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_show_edge_number` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_show_edge_number`
`-objects` *`string`*	Specifies the name of the object for which the edge numbers should be displayed. If you want to specify multiple object names, enclose them in braces or double quotation marks. Currently, you can display the edge numbers for partitions and blocks.
`-reset`	Clears the edge numbers from the specified or selected objects on the GUI. If you want to clear the edge numbers for all objects, use the `-reset` parameter with `-objects *`.

Examples

- The following command displays the edge numbers on the `DTMF_INST/PLLCLK_INST` block in the GUI:

  ```
  gui_show_edge_number -objects DTMF_INST/PLLCLK_INST
  ```



- The following command clears the edge numbers from all blocks:

  ```
  gui_show_edge_number -objects * -reset
  ```

Related Information

gui_trace_flightline

```
gui_trace_flightline
[-help]
-inst instance_name
[-max_inout_number value]
{[-sink  -sink_level value -sink_color string] | [-source  -source_level value -
source_color string]}
```

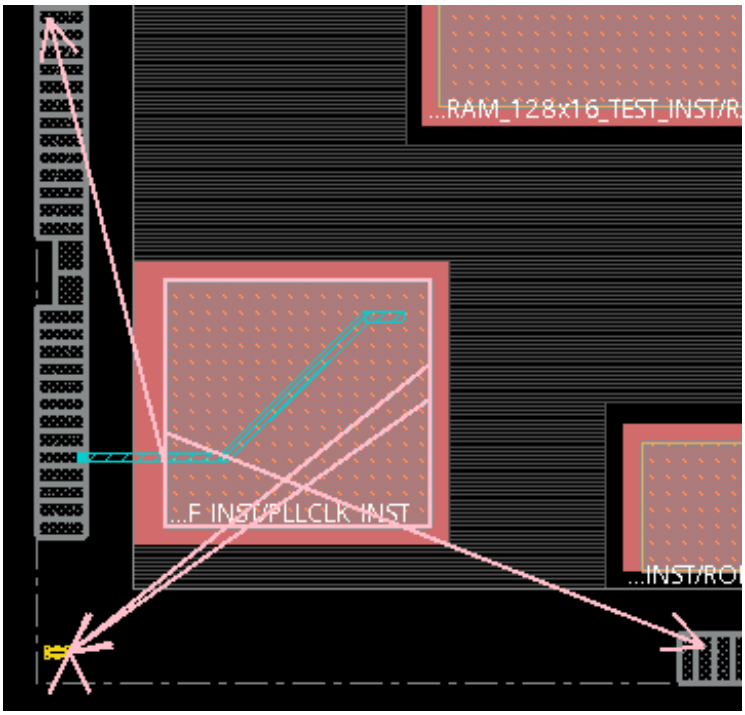
Traces flightlines for the specified instance from either the output pins (with `-sink`) or the input pins (with `-source`). The flightlines drawn with `gui_trace_flightline` are not dependent on instance selection. These flightlines are cleared only when you use `gui_clear_trace_flightline`.

Parameters

`-help`	Prints a brief description of the `gui_trace_flightline` command. For a detailed description of the command, use the `man` command: `man gui_trace_flightline`.
`-inst` *`instance_name`*	Specifies the name of the instance from which the flightline starts
`-max_inout_number` *`value`*	Specifies the maximum number of net terms. If the net has more terms than the specified number, the tool skips this net while tracing the flightline. *Default*: 50
`-sink`	Traces flightlines from the output pins of the specified instance. You must also specify `-sink_color` and `-sink_level` with this option. You cannot use this option with any of the `-source*` options.
`-sink_color` *`string`*	Specifies the color of the sink trace.
`-sink_level` *`value`*	Specifies the sink trace level.
`-source`	Traces flightlines from the input pins of the specified instance. You must also specify `-source_color` and `-source_level` with this option. You cannot use this option with any of the `-sink*` options.
`-source_color` *`string`*	Specifies the color of the source trace.
`-source_level` *`value`*	Specifies the source trace level.

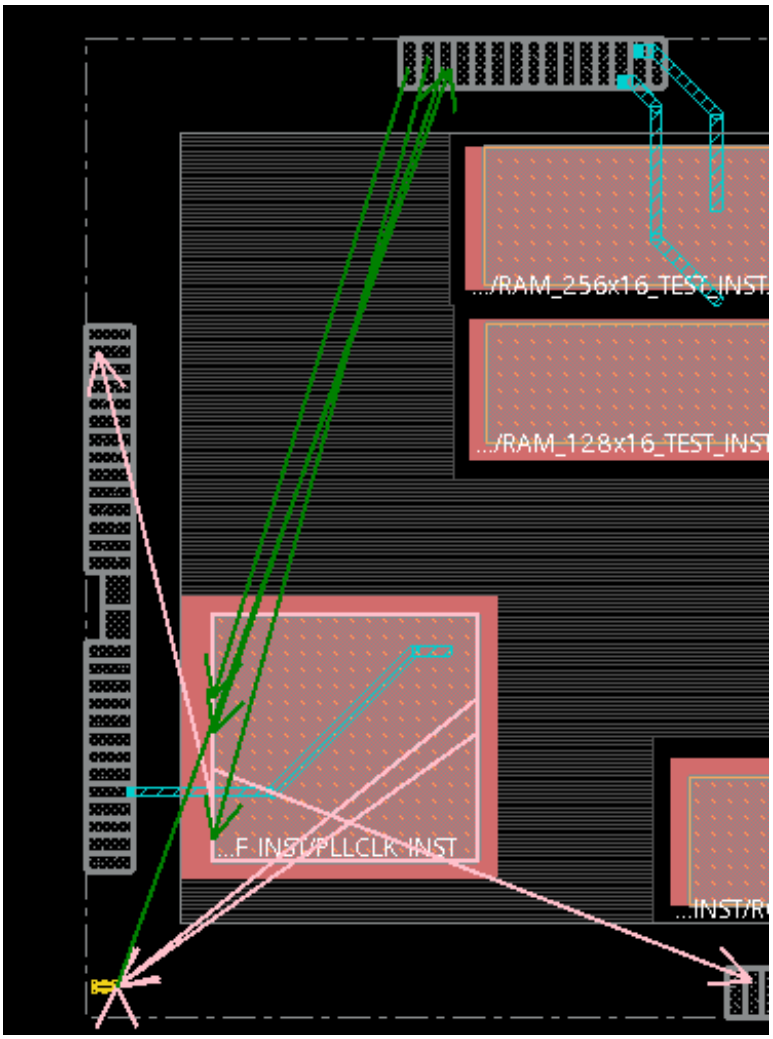
Examples

- The following command traces flightlines for the `DTMF_INST/PLLCLK_INST` instance from the output pins for `2` logic levels in the color `pink`:
  ```
  gui_trace_flightline -inst DTMF_INST/PLLCLK_INST -sink -sink_level 2 -sink_color pink
  ```



- The following command traces flightlines for the `DTMF_INST/PLLCLK_INST` instance from the input pins for `2` logic levels in the color `green`:

  ```
  gui_trace_flightline -inst DTMF_INST/PLLCLK_INST -source -source_level 2 -
  source_color green
  ```



Related Information

- gui_save_flightline

gui_ungroup_hinst

```
gui_ungroup_hinst
[-help]
[-display_all_constraints]
[-type {flex_model} | hname]
```

Displays the submodules for the specified module guide. The `gui_ungroup_hinst` command is equivalent to the *Ungroup* widget on the toolbar.

If you try to ungroup a module that contains only standard cells and marcos but does not contain any submodules, the tool ignores the ungroup request and issues the following warning:

```
**WARN: (ENCSYT-3162): Cannot ungroup Module 'DTMF_INST/RAM_128x16_TEST_INST' because
it has no child.
```

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_ungroup_hinst` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_ungroup_hinst`
`-display_all_constraints`	Displays all constraints, such as fences, guides, regions, and soft guides, regardless of the current hierarchy. When this option is specified, you can view the child constraints.
hname	Specifies the name of the hierarchical instance (hinst) to be ungrouped.
`-type {`*flex_model*`}`	Specifies the object type to be ungrouped. At present, only the `flex_model` type is supported. If you specify `-type {`*flex_model*`}`, the command ungroups all hierarchical instances or parent hinst down to the flex_module and/or flex_instgroup level.

Examples

- The following command ungroups the specified module and displays its submodules.
  ```
  gui_ungroup_hinst DTMF_INST/TDSP_CORE_INST
  ```
- The following command ungroups all hierarchical instances or parent hinst down to the flex_module and/or flex_instgroup level:
  ```
  gui_ungroup_hinst -type {flex_model}
  ```

Related Information

highlight

```
highlight
[-help]
[<any_object>+]
[-index indexValue | -auto_color  | -original]
[-color colorValue | -auto_color  | -original]
[-pattern patternValue | -original]
```

Highlights selected or specified objects with the Highlight Set available through the *View - Highlight Selected* menu. The value for the index corresponds to the Highlight Set that will be applied. For example, a value of 4 for the index specifies that all selected objects will be highlighted with the same color and pattern as available for the *Highlight Set #4* in the *View - Highlight Selected* menu. You can use this command at any stage in the design flow.

You can also provide a specific color and/or pattern to be used. All selected objects will be highlighted with the color and/or pattern that you specify.

If you specify a color and or pattern, the Highlight Set corresponding to the index value will be updated to use the color and pattern specified. For example, if you specify an index value of 5, color `green`, and pattern `backslash`, the *Highlight Set #5* will get updated to have the color `green` and the pattern `backslash`.

You can dehighlight the highlighted objects through the `dehighlight` command or through the *View - Clear Highlight* menu.

Note: If an object is selectable, you can highlight it using the `highlight` command.

Use the `highlight_pin` command to highlight shapes for specified SIGNAL/POWER pins.

Parameters

`-help`	Prints a brief description that includes type and default information for each `highlight` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man highlight`
any_object+	Specifies object pointer list for highlighting.

`-auto_color`	Specifies the object color automatically. When this parameter is specified, the selected object is highlighted with a different color each time you call the `highlight` command. **Note**: This parameter cannot be used with `-index` or `-color`.
`-index` *`indexValue`*	Specifies the index value for the specified object. All objects that are selected will be highlighted with the same color and pattern as defined in corresponding Highlight Set in the *View - Highlight Selected* menu As an example, if you specify a value of 3 for index, all objects that are selected will be highlighted with the same color and pattern as available for the *Highlight Set #3* in the *View - Highlight Selected* menu. Note that the maximum value is related to the *Number of Highlight Color* setting in the Edit Highlight Color form. If this value is 64, the maximum acceptable value for the `-index` option is 64. If set to 256, the maximum acceptable value for `-index` is 256. The minimum value is `1`.
`-color` *`colorValue`*	Specifies the color value for the specified object. The color value is the same as that available through the Edit Highlight Color form (*View - Edit Highlight Color*). You can also use the Red Green Blue (RGB) value in the following format: #*`V1V2V3`* where V1, V2, and V3 are the hexadecimal values for the red, green, and blue color components respectively. For example, you can specify the value `#CC66FF`. *Default:* The color defined for the Highlight Set corresponding to the index value is used.

`-original`	Highlights the object in original color. This option is useful if you want to check a specific object more closely with the background dimmed. An object highlighted in original color will stand out in the dimmed background:  **Note**: This parameter cannot be used with `-index`, `-color`, or `-pattern`.
`-pattern` *`patternValue`*	Specifies the pattern value for the specified object. The pattern value is the same as the Stipple Value available through the Edit Highlight Color form. *Default:* The pattern (Stipple Value) for the Highlight Set corresponding to the index value is used.

Examples

- The following command highlights all selected objects with the same color and pattern as defined for the *Highlight Set #4* in the *View - Highlight Selected* menu.

  ```
  highlight -index 4
  ```

- The following commands highlight the boxes named `fuu` and `bar` with the same color and pattern as defined for the *Highlight Set #4* in the *View - Highlight Selected* menu.

  ```
  highlight [ list [ dbget -p1 top.insts.name fuu ] [ dbget -p1 top.insts.name bar ] ] -index 4
  ```

  or

  ```
  highlight " [ dbget -p1 top.insts.name fuu ] [ dbget -p1 top.insts.name bar ] " -index 4
  ```

- The following command highlights just the box named `fuu` with the same color and pattern as defined for the *Highlight Set #4* in the *View - Highlight Selected* menu.

  ```
  highlight [ dbget -p1 top.insts.name fuu ] -index 4
  ```

- The following command highlights all selected objects with the color `green` and the pattern `dot4`. The index values is set to 5 and, therefore, the command will also change the definition of the *Highlight Set #5* (*View - Highlight Selected* menu) to have color `green` and pattern `dot4`.

  ```
  highlight -index 5 -color green -pattern dot4
  ```

- The following command highlights all selected objects with the color corresponding to the RGB hexadecimal value `#33FF66` and the pattern `horizontal`. The index values is set to 3 and, therefore, the command will also change the definition of the *Highlight Set #5* (*View - Highlight Selected* menu) to have color `#33FF66` and pattern `horizontal`.

  ```
  highlight -index 3 -color #33FF66 -pattern horizontal
  ```

highlight_pin

```
highlight_pin
[-help]
-inst string
-pin string
[-original | -index indexValue ]
[-original | -color colorValue ]
[-original | -pattern patternValue ]
```

Highlights the shapes of all specified SIGNAL/POWER instance pins with the Highlight Set available through the *Edit - Highlight Selected* menu. The value for the index corresponds to the Highlight Set that will be applied. For example, a value of 4 for the index specifies that all selected objects will be highlighted with the same color and pattern as available for the *Highlight Set #4* in the *Edit - Highlight Selected* menu.

You can also provide a specific color and/or pattern to be used. All specified pins will be highlighted with the color and/or pattern that you specify.

Note: If you specify a color and or pattern, the Highlight Set corresponding to the index value will be updated to use the color and pattern specified. For example, if you specify an index value of `5`, color `green`, and pattern `backslash`, the *Highlight Set #5* will get updated to have the color `green` and the pattern `backslash`.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `highlight_pin` parameter. For a detailed description of the command and all of its parameters, use the man command: `man highlight_pin`

`-color` *colorValue*	Specifies the color value for the specified object. The color value is the same as that available through the Edit Highlight Color form, which can be accessed by selecting *Edit - Edit Highlight Color*. You can also use the Red Green Blue (RGB) value in the following format: `#`*V1V2V3* where *V1*, *V2*, and *V3* are the hexadecimal values for the Red, Green, and Blue color components, respectively. For example, you can specify the value `#CC66FF`. *Default:* The color defined for the Highlight Set corresponding to the specified index value is used.
`-index` *indexValue*	Specifies the index value for the specified object. By default, all specified pins are highlighted with the same color and pattern as defined in the *Highlight Set* corresponding to the specified index value in the *Edit - Highlight Selected* submenu. For example, if you specify a value of 3 for index, all specified pins are highlighted with the same color and pattern as available for *Highlight Set #3* in the *Edit - Highlight Selected* submenu. **Note**: The *Edit - Highlight Selected* submenu provides eight highlight patterns. Therefore, the value of the index should be a number from 1 to 8.
`-inst` *string*	Specifies the name of instance.
`-original`	Highlights the instance pin in original color. This option is useful if you want to check a specific instance pin more closely with the background dimmed. An object highlighted in original color will stand out in the dimmed background. **Note**: This parameter cannot be used with `-index`, `-color`, or `-pattern`.
`-pattern` *patternValue*	Specifies the pattern value for the specified object. The pattern value is the same as the *Stipple* value available through the Edit Highlight Color form. *Default:* The pattern (*Stipple* value) defined for the Highlight Set corresponding to the specified index value is used.
`-pin` *string*	Specifies the name of SIGNAL/POWER pin to be highlighted. You can specify more than one pin name.

Examples

- The following command highlights the SIGNAL pins `E` and `D` of instance `U1` using the color yellow and the solid pattern:

  ```
  highlight_pin -inst U1 -pin {E D} -color yellow -pattern solid -index 1
  ```

- The following command highlights the SIGNAL pin `E` and the POWER pin `gnd` of instance `U1` using the color yellow and the solid pattern:

  ```
  highlight_pin -inst U1 -pin {E gnd} -color yellow -pattern solid -index 1
  ```

highlight_pin_connection

```
 highlight_pin_connection
[-help]
-from_pin pin
[-mode {wire_segment | whole_net | flight_line}]
-to_pin pin
[-with_arrow | -select_only]
[-net_color_index index_value | -select_only]
[-inst_color_index index_value | -select_only]
```

Highlights the full timing path or its segment in the text format while generating the sign-off timing report. Use this command to quickly debug the timing path (timing point information) used in the tool.

Parameters

`-help`	Prints a brief description that includes type and default information for each `highlight_pin_connection` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man highlight_pin_connection`
`-from_pin` *`pin`*	Specifies the name of the starting pin or IO port to be highlighted.
`-inst_color_index` *`index_value`*	Specifies the instance color index value (an integer value from 1 to 64) for the specified timing path.
`-mode {wire_segment | whole_net | flight_line}`	Specifies the draw mode between the starting and ending pins.
`-net_color_index` *`index_value`*	Specifies the net color index value (an integer value from 1 to 64) for the specified timing path.
`-select_only`	Selects only the specified path for highlighting.
`-to_pin` *`pin`*	Specifies the name of the ending pin or IO port to be highlighted.
`-with_arrow`	Specifies whether or not the connection is defined with an arrow.

Example

The following command highlights a line drawn from the specified input pin to output pin while generating the sign-off timing report:

```
highlight_pin_connection -from_pin ffa/Q -U7/A -mode flight_line
```

The timing report generated is shown below:

:::::::Timing Report::::::::::::

```
Startpoint: ffa (rising edge-triggered flip-flop clocked by CLK)
Endpoint: ffd (rising edge-triggered flip-flop clocked by CLK)
Path Group: CLK
Path Type: max

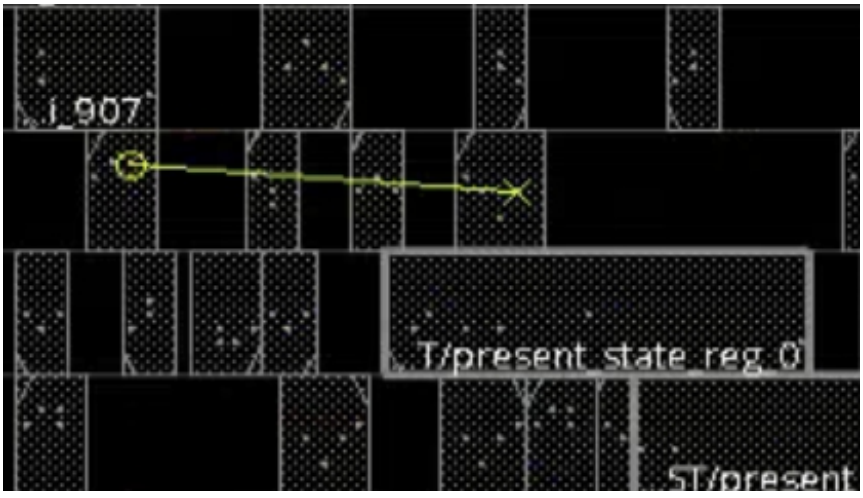
:::::::END:::::::::::
```

The drawn layout along with the highlighted line is shown in the below picture:



lineSelect

```
lineSelect
[-help]
mode
ux1 uy1 ux2 uy2
```

Selects all objects that fall across the specified line coordinates. The `lineSelect` command is equivalent to the *Select by Line* check box in the *Selection* page of the Preferences form.

Innovus provides an easy way to toggle between window and line selection modes using the GUI:

1. The default selection mode is window.
2. Press the `Ctrl` key to switch to the line selection mode. With the `Ctrl` key pressed, draw a line across the objects you want to select. All the objects that the line crosses are selected.
3. When you release the `Ctrl` key, the selection mode switches back to window.

Note: This command works only in GUI mode.

Parameters

`-help`	Prints a brief description that includes type and default information for each `lineSelect` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man lineSelect`
mode	Specifies the action to be performed on the objects falling across the specified line coordinates. Choose one of the following modes: • `new`: Selects all objects crossed by the line. This mode is equivalent to the *Select by Line* check box in the *Selection* page of the Preferences form. • `delete`: Deletes all object selections crossed by the line. Use this mode if multiple objects are selected and you want to deselect some of them but retain the other selections. • `append`: Selects objects crossed by the line and appends them to the current selection. • `toggle`: Deselects objects in the bounding box if they are selected; selects objects if they are deselected.
ux1 uy1 ux2 uy2	
	Specifies the start and end points of the line.

Example

The following command selects all objects falling across the specified line coordinates.

```
lineSelect new 168.654 994.049 688.129 436.224
```

Related Information

- `windowSelect`
- `windowToggleSelect`

list_gui_marker

`list_gui_marker`

Gives a list of GUI markers in the design layout.

Parameters

`-help`	Prints a brief description of the `list_gui_marker` command. For a detailed description of the command, use the `man` command: `man list_gui_marker`.

Example

- The following command shows a list of GUI markers:
  `list_gui_marker`
  The following is displayed:
  `{name:aa  coordinate:(100.000 100.000)}`

Related Information

- `add_gui_marker`
- `remove_gui_marker`

loadWorkspace

```
loadWorkspace
[-help]
-name workspaceName
[-dir directory]
```

Loads the named workspace from the specified directory. A workspace contains customized main window settings including:

- Size and placement of window
- Specific orientation of toolbars
- Docking status
- Visibility settings

You can use the `loadWorkspace` command at any stage in the design flow to load a previously saved workspace. However, if you want Innovus to load a specific workspace automatically on starting, you need to first set that workspace as default using the `setDefaultWorkspace` command.

Parameters

`-help`	Prints a brief description that includes type and default information for each `loadWorkspace` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man loadWorkspace`
`-name` *`workspaceName`*	Specifies the name of the workspace to be loaded.
`-dir` *`directory`*	Specifies the directory from which the workspace is to be loaded. The default search order to access directories for loading workspaces is as below: • Current working directory • User home directory The `-dir` parameter is useful if you have workspaces with the same name in both the current working directory and your home directory. If you do not specify `-dir`, the software loads the *`workspaceName`* workspace from the current working directory.

Example

The following example loads the `MyWorkspace` workspace from the current working directory.

```
loadWorkspace -name MyWorkspace
```

Related Information

open_schematic

```
open_schematic
[-help]
[-name string]
[-objects <inst | net | instTerm | term | hinst>+ | -selected]
[-type {module cone}]
```

Opens the schematic view of the specified or selected objects.

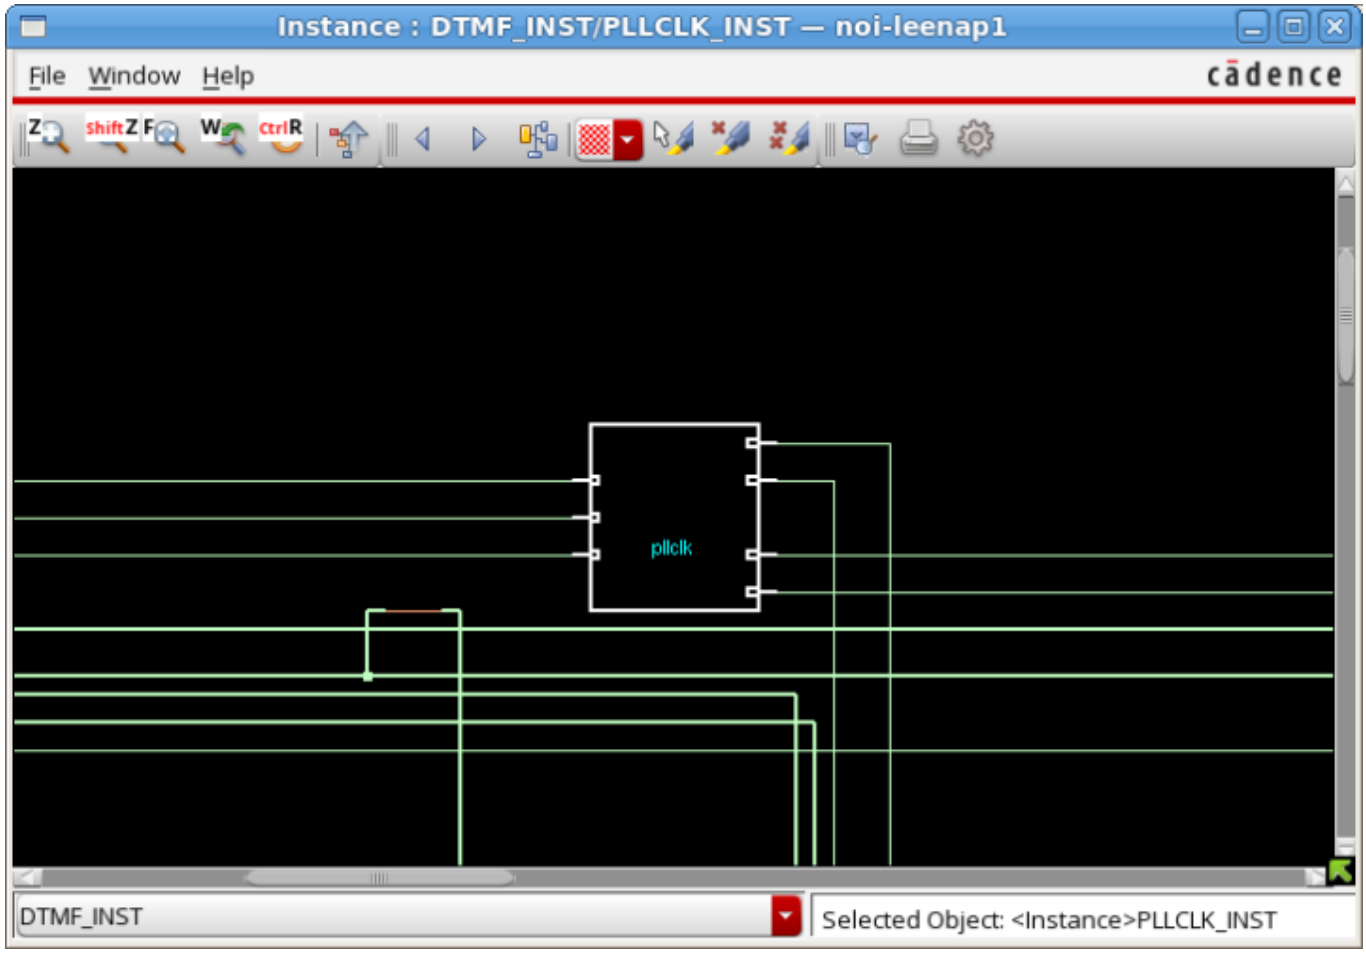
Parameters

`-help`	Prints out the command usage. For a detailed description of the command, use the `man` command: `man open_schematic`
`-name` *string*	Specifies a unique window name for the schematic view to be opened. *Data_type*: string, optional
`-objects <inst | net |` *instTerm* `|` *term* `|` *hinst*`>+`	
	Specifies the object(s) to be added in the schematic view. If multiple objects are specified, the Schematic Viewer can be opened only in the flattened mode (`-type cone`). As the default schematic mode is hierarchical, this means you must always specify `-type cone` when specifying multiple objects. **Note**: This option cannot be used with `-type module`. Data_type: (*inst*|*net*|*instTerm*|*term*|*hinst*)+, optional
`-selected`	Specifies that the selected object(s) are to be added in the schematic view. If multiple objects are selected, the Schematic Viewer can be opened only in the flattened mode (`-type cone`). As the default schematic mode is hierarchical, this means you must always specify `-type cone` when selecting multiple objects. **Note**: This option cannot be used with `-objects` or `-type module`. *Data_type*: bool, optional
`-type {module cone}`	Specifies the type of schematic to be opened. If you specify `cone`, the tool opens the Schematic Viewer to display schematic in the flattened mode. If you specify `module`, the tool opens the Schematic Viewer to display schematic in the hierarchical mode. *Default*: `module` *Data_type*: enum, optional

Examples

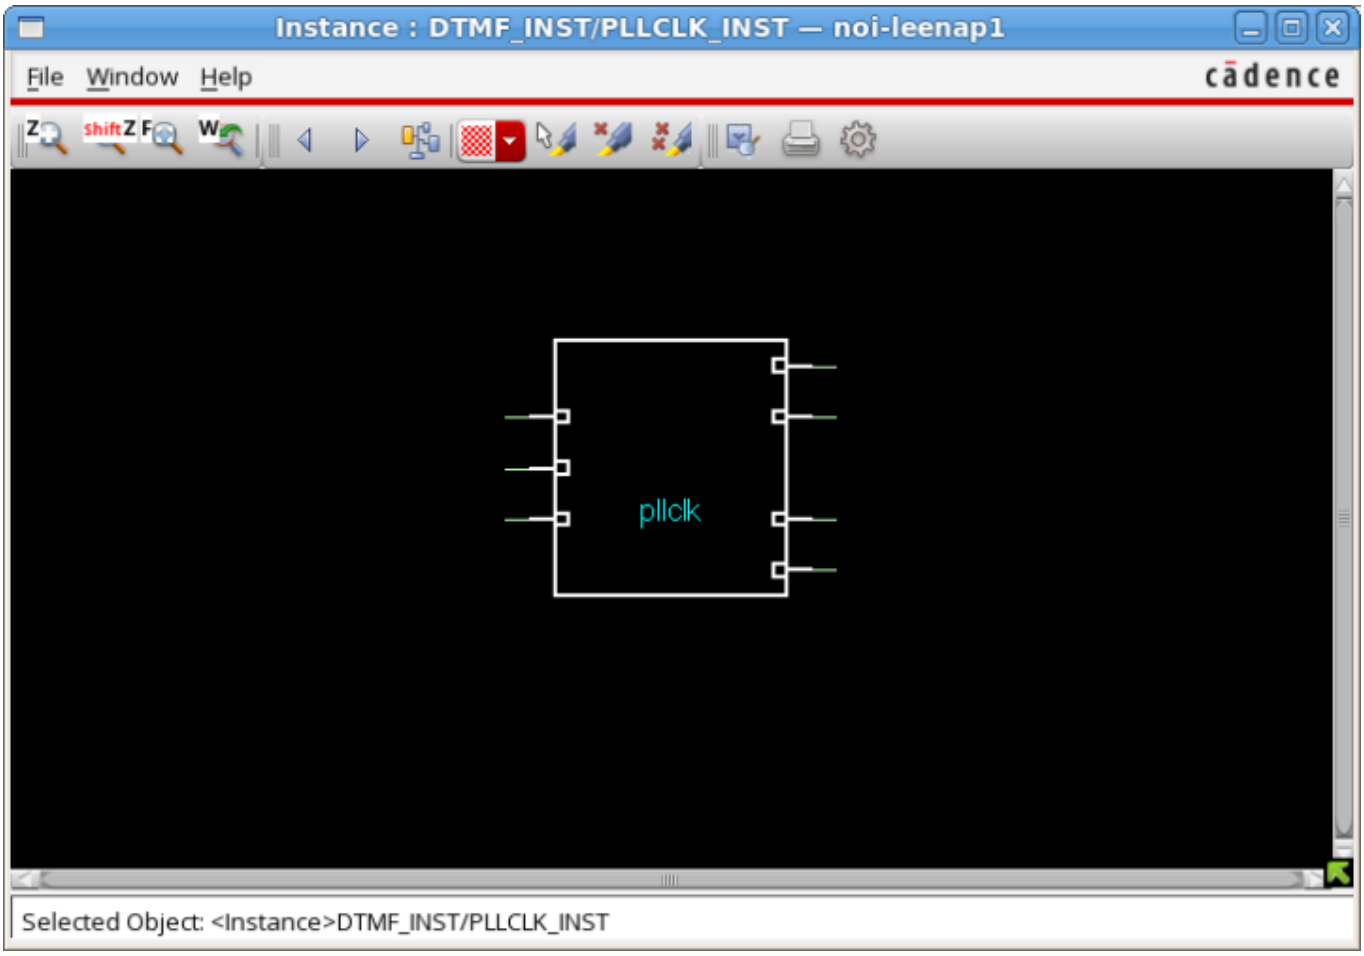
- The following command opens the schematic for the specified instance in the hierarchical mode:

```
open_schematic -objects DTMF_INST/PLLCLK_INST
```



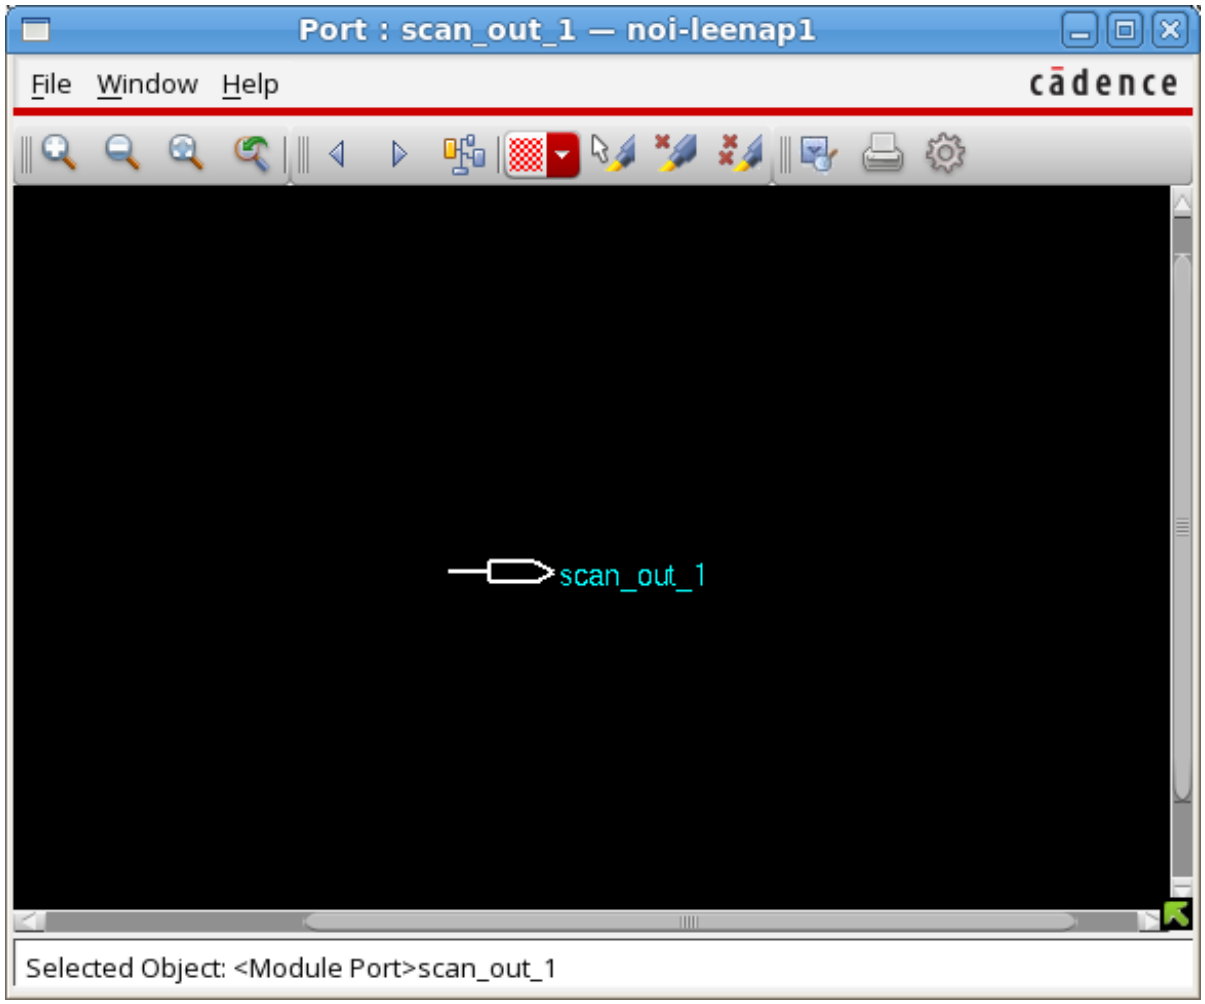
- The following command opens the schematic for the specified instance in the flattened mode:

```
open_schematic -objects DTMF_INST/PLLCLK_INST -type cone
```



- The following command opens the schematic for the selected object in the flattened mode:

```
open_schematic -selected -type cone
```



- The following command opens the schematic for multiple selected objects in the flattened mode:

```
open_schematic -selected -type cone
```

pan

```
pan
[-help]
dx
dy
```

Specifies that the new center of the viewing window should shift from the current center of the viewing window by (*x*, *y*) microns. Use this command at any stage in the design flow to pan or move the design view in a specific direction.

Parameters

`-help`	Prints a brief description that includes type and default information for each `pan` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man pan`.
dx	Specifies that the design center should shift *dx* microns on the x-axis from the center of the viewing window. You can specify positive or negative values for *dx*. A positive value specifies shifting to the right on the x axis.
dy	Specifies that the design center should shift `dy` microns on the y axis values from the center of the viewing window. You can specify positive or negative values for *dy*. A positive value specifies shifting up on the y axis.

Example

The following example shifts the design center to the right by 200 microns and down by 300 microns from the center of the viewing window.

```
pan 200 -300
```

panCenter

```
panCenter
[-help]
x y
```

Pans in the viewable window to the center point defined by the specified coordinates. Use this command at any stage of the design flow to view the design area around a specific point.

Parameters

`-help`	Prints a brief description that includes type and default information for each `panCenter` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man panCenter`.
`x y`	Specifies the x and y coordinates of the center point.

Example

The following command pans the viewable window to the center point (x=100, y=200)

```
panCenter 100 200
```

Related Information

  - *Mouse Operations*

panPage

```
panPage
[-help]
x y
```

Pans the viewable window in pages defined by the offsets. The size of each page is equal to the size of the current viewable window. Use this command at any stage of the design flow.

Parameters

`-help`	Prints a brief description that includes type and default information for each `panPage` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man panPage`.
`x y`	Specifies `x` and `y` offsets to indicate number of pages to pan. A positive value of *`x`* specifies a pan of *`x`* pages to the right. A positive number of *`y`* specifies a pan of *`y`* pages toward the top. You can specify integer values for *`x`* and *`y`*.

Examples

- The following command pans the display to the right by one page
  ```
  panPage 1 0
  ```
- The following command pans the display to the left by one page
  ```
  panPage -1 0
  ```

read_temperature_map_file

```
  read_temperature_map_file
[-help]
-file <string>
```

Loads the tile-based temperature map file generated by Sigrity Celsius to be used for displaying temperature.

Parameters

`-help`	Outputs the command usage and a brief description about the command parameters.
`-file <string>`	Specifies the name of the tile-based temperature map file generated by Sigrity Celsius.

redo

```
redo [-help]
```

Returns the design to the state it was in immediately prior to issuing the `undo` command. It can be used only to reinstate power planning, bump placement, and selected floorplanning and wire edit functions that were removed with the `undo` command.

You can use this command after you use the `undo` command for any of the following text commands:

- Selected bump placement commands:
  - `create_bump`
  - `deleteBumps`
- Selected floorplanning commands:
  - `alignObject`
  - `flipOrRotateObject`
  - `setObjFPlanBox`
  - `setObjFPlanBoxList`

  - setObjFPlanPolygon
  - snapFPlan
  - snapFPlanIO
  - spaceObject
- Selected power planning commands:
  - addRing
  - addStripe
  - editPowerVia
  - sroute
- All wire editor commands:
  - editAddFillet
  - editAddPoly
  - editAddRoute
  - editAddTrimMetal
  - editAddVia
  - editChangeLayer
  - editChangeNet
  - editChangeRule
  - editChangeStatus
  - editChangeVia
  - editCommitPoly
  - editCommitRoute
  - editCutWire
  - editDelete
  - editDeleteFillet
  - editDeselect

- editDuplicate
- editFixWideWires
- editMerge
- editMove
- editResize
- editRotate
- editSelect
- editSplit
- editTrim
- prepareForEcoRoute

Parameters

-help	Prints a brief description of the `redo` command. For a detailed description of the command, use the `man` command: `man redo`

Related Information

- undo
- Edit Menu chapter in the *Menu Reference*
  - *Undo*
  - *Redo*

redraw

```
redraw [-help]
```

Refreshes the display in the viewable window. This command performs the same function as the *Redraw* icon (CTRL+R keyboard shortcut). You can use this command at any stage in the design flow.

Parameters

`-help`	Prints a brief description of the `redraw` command. For a detailed description of the command, use the `man` command: `man redraw`.

register_gui_edit_callback

```
register_gui_edit_callback
[-help]
-command string
-edit_type {selection pre-move post-move}
```

Adds the callback function to the specified move action. In GUI, the move action involves the following three steps:

1. Click an object.
2. Move the object to the new location.
3. Click to place the object at the new location and complete the move.

The callback function is implemented based on the move action specified with the `-edit_type` parameter.

Parameters

`-help`	Prints the usage of the command. For a detailed description of the command, use the `man` command: `man register_gui_edit_callback`
`-command string`	Specifies the name of the callback function.
`-edit_type {selection pre-move post-move}`	Specifies the GUI edit function: • `selection` - Implements the callback function when an object is selected (after Step 1). • `pre-move` - Implements the callback function just before the object is placed at the new location (after Step 2, just before you change the coordinates in Step 3). • `post-move` - Implements the callback function after an object is moved (after Step 3, when the tool updates the DB records).

Example

Consider the following proc definition:

```
proc move_event_callback {args} {
     set objList $args
     foreach obj $objList {
           set type [dbGet $obj.objType]
           if {$type == "sdp"} {
                custom_snap_sdp $obj
           } elseif {$type == "inst"} {
                set cellName [dbGet $obj.cell.name]
                if {[regexp grf $cellName]} {
                     custom_snap_grf $obj
                }
           }
}
}
```

The following command adds the `move_event_callback` function to the selected object just before the move is completed:

```
register_gui_edit_callback -edit_type pre_move -command {move_event_callback [dbGet selected]}
```

Related Information

- report_gui_edit_callback
- unregister_gui_edit_callback

remove_gui_marker

```
remove_gui_marker
[-help]
{-name <string> | -all }
```

Removes a marker from the design layout.

Parameters

`-help`	Outputs the command usage and a brief description about the command parameters.
`-name <string>`	Specifies the name of the marker to be removed from the design layout.
`-all`	Removes all markers from the design layout.

Related Information

- `add_gui_marker`
- `list_gui_marker`

report_gui_edit_callback

```
report_gui_edit_callback
[-help]
[-edit_type {selection pre-move post-move}]
[-file string]
```

Reports the callback functions added to the specified move action. In GUI, the move action involves the following three steps:

1. Click an object.
2. Move the object to the new location.
3. Click to place the object at the new location and complete the move.

The callback function is implemented based on the move action specified with the `-edit_type` parameter.

Note that the `report_gui_edit_callback` command does not report the default callback functions.

Parameters

`-help`	Prints the usage of the command. For a detailed description of the command, use the `man` command: `man report_gui_edit_callback`
`-edit_type {selection pre-move post-move}`	Specifies the GUI edit function: • `selection` - Implements the callback function when an object is selected (after Step 1). • `pre-move` - Implements the callback function just before the object is placed at the new location (after Step 2, just before you change the coordinates in Step 3). • `post-move` - Implements the callback function after an object is moved (after Step 3, when the tool updates the DB records).
`-file string`	Specifies the name of the file.

Example

Consider the following proc definitions:

```
proc move_callback_1 {

     ...

}

proc move_callback_2 {

     ...

}

proc select_callback_1 {

     ...

}
```

- The following commands add the specified callback functions to the selected object based on the selection and on the post-move operations, as specified below:

  ```
  register_gui_edit_callback -edit_type post-move -command move_callback_1

  register_gui_edit_callback -edit_type post-move -command move_callback_2

  register_gui_edit_callback -edit_type selection -command select_callback_1
  ```

- The following command reports all the callback functions on the console:

  ```
  > report_gui_edit_callback

  ################################
  # GUI Callback Function Report
  ################################
  Post Move:
  move_callback_1
  move_callback_2

  Selection:
  select_callback_1
  ```

- The following command prints the callback functions on the post-move operation to the file `cb_move`:

  ```
  report_gui_edit_callback -edit_type post-move -file cb_move
  ```

  The contents of the file is as follows:

```
#########################################################################
#  Generated by:      Cadence Innovus 18.10-d133_1
#  OS:                Linux x86_64(Host ID sjfib212)
#  Generated on:      Sun Oct  8 19:51:35 2017
#  Design:            DTMF_CHIP
#  Command:           report_gui_edit_callback -edit_type post-move -file cb_move
#########################################################################
Post Move:
move_callback_1
move_callback_2
```

Related Commands

- register_gui_edit_callback
- unregister_gui_edit_callback

resetMultiColorsHier

```
resetMultiColorsHier
[-help]
[colorID [hInstName]]
```

Resets the color Id for all or the specified hierarchical instances.

Parameters

`-help`	Prints a brief description that includes type and default information for each `resetMultiColorsHier` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man resetMultiColorsHier`.
`colorID`	Specifies the color Id to which all hierarchical instances or the specified hierarchical instance will be reset. The valid values of color Id are from 0 to 29. The color value for the color id is the same as specified in the Module Color Preference form (accessed by clicking *Floorplan - Edit Floorplan - Color Module*). *Default*: If no color Id and no instance name is specified, all hierarchical instances are displayed with the color id `0`. This is the same behavior as the *Reset* button on the Module Color Preferences form.
`hInstName`	Specifies the name of hierarchical instance that should be displayed in the color corresponding to the specified color Id. *Default*: If no instance is specified, the color Id for all hierarchical instances is reset.

Example

- The following command resets the color Id for all hierarchical instances and their descendants to `3`:

  ```
  resetMultiColorsHier 3
  ```

- The following command resets the color Id for the hierarchical instance *`DTMF_INST`* and all its descendants to the color id 3:

```
resetMultiColorsHier 3 DTMF_INST
```

saveColorPreference

```
saveColorPreference
[-help]
[-dir <string>]
[-include_customized]
-name <string>
```

Saves color preferences for the Innovus main display as specified in the Color Preferences form.

Parameters

`-help`	Prints a brief description that includes type and default information for each `saveColorPreference` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man saveColorPreference`
`-dir` *string*	Specifies the directory path. By default, the color preference file is saved in the current directory.
`-include_customized`	Includes the settings in the Customize Tab form within the Color Preferences form.
`-name` *string*	Specifies the name of the color preference file.

saveHInstColor

```
saveHInstColor
[-help]
fileName
```

Saves the current color setting for a hierarchical instance from the Module Color Preference form to a file. The Module Color Preference form is accessed by clicking *Floorplan - Edit Floorplan - Color Module*.

Parameters

`-help`	Prints a brief description that includes type and default information for each `saveHInstColor` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man saveHInstColor`.
`fileName`	Specifies the name of the file that stores 30 color settings starting with the `setLayerPreference` command. This is the same behavior as the Save button on the Module Color Preference form.

Example

The following command saves the current color setting for a hierarchical instance from the Module Color Preference form to a file named `hinstColorFile`:

```
saveHInstColor hinstColorFile
```

saveWorkspace

```
saveWorkspace
[-help]
-name workspaceName
[-dir directory]
```

Saves the named workspace to the specified directory. You can then load the workspace whenever you want from the specified directory by using the `loadWorkspace` command. A workspace contains customized main window settings including:

- Size and placement of window
- Specific orientation of toolbars
- Docking status
- Visibility settings

Parameters

`-help`	Prints a brief description that includes type and default information for each `saveWorkspace` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man saveWorkspace`
`-name workspaceName`	Specifies the name of the workspace to be saved.
`-dir directory`	Specifies the directory in which the workspace is to be saved. *Default*: Current working directory

Example

The following example saves the current window settings to the `TestWorkspace` in the current working directory.

```
saveWorkspace -name TestWorkspace
```

select_highlighted

```
select_highlighted
[-help]
[-type string]
```

Selects highlighted objects. If `-type` is specified, selects highlighted objects of the specified type.

Parameters

`-help`	Prints a brief description that includes type and default information for each `select_highlighted` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man select_highlighted`
`-type` *`string`*	Specifies the type of the highlighted objects to be selected. Options are `instance`, `wire`, and `via`.

Examples

- The following command selects all highlighted instances.
  ```
  select_highlighted -type instance
  ```

Related Information

- `gui_select`
- `highlight`

selectModule

```
selectModule
[-help]
name
```

Selects the specified module.

Parameters

`-help`	Prints a brief description that includes type and default information for each `selectModule` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man selectModule`
name	Specifies the name of the module to be selected.

Example

The following example selects the `DTMF_INST` module.

```
selectModule DTMF_INST
```

Related Information

- `deselectModule`

selectPin

```
selectPin
[-help]
name
```

Selects the specified pin.

Parameters

`-help`	Prints a brief description that includes type and default information for each `selectPin` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man selectPin`
`name`	Specifies the name of the pin to be selected.

Example

The following example selects the `swack` pin.

```
selectPin swack
```

Related Information

- `deselectPin`

set_object_color

```
set_object_color
[-help]
{[-object_name InstOrHInstName | -object_type typeList]
[-multicolor | -color_id colorID]
[-include_children {off | color | multicolor}]
[-reset]}
```

Sets the color for objects of the specified name or type. You can choose to include children when specifying object color for a hierarchical instance (HInst).

The `set_object_color` command is typically used during floorplanning to color objects that are currently displayed in the design display area. You can use this command to distinguish between objects of different type or between objects belonging to different instances, hierarchical instances, instance groups, or power domains.

Before using the `set_object_color` command, you should have:

- Loaded the floorplan
- Ungrouped objects so that only required objects are displayed in the design display area in the Floorplan or Physical view.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_object_color` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_object_color`.
`-color_id` *`colorID`*	Specifies the color ID from 0 to 29. The color value for the color ID is the same as specified in the Module Color Preference form (accessed by clicking *Floorplan - Edit Floorplan - Color Module*). *Default*: Color ID `0`
`-include_children {off | color | multicolor}`	Specifies whether the children of the hierarchical instance will be colored simultaneously when you specify a color for an HInst. You can set one of the following options: • `off`: The child instances will not be colored. • `color`: The child instances are colored the same color as their parent instance. • `multicolor`: The child instances are colored in multiple colors.
`-multicolor`	Uses multiple colors to color objects of the specified type, instance, or hierarchical instance.
`-object_name` *`InstOrHInstName`*	Specifies the name of the instance, hierarchical instance, power domain, or instance group whose objects are to be colored. You can specify an object list, such as `objectName {A,B}` for *`objName`*.
`-object_type` *`typeList`*	Specifies the list of type of objects that are to be colored, such as `BusGuide`, `Module`, `PowerDomain`, and `InstGroup`.
`-reset`	Resets the object color.

Examples

- The following command colors the `DTMF_INST/TDSP_CORE_INST` instance with color `3`, as specified in the Module Color Preference form:

```
set_object_color -object_name DTMF_INST/TDSP_CORE_INST -color_id 3
```

- The following command colors the `DTMF_INST/TDSP_CORE_INST` instance and its children with color `3`, as specified in the Module Color Preference form:

  ```
  set_object_color -object_name DTMF_INST/TDSP_CORE_INST -color_id 3 -
  include_children color
  ```

- The following command colors the children of the `DTMF_INST/TDSP_CORE_INST` instance in multiple colors:

  ```
  set_object_color -object_name DTMF_INST/TDSP_CORE_INST -include_children
  multicolor
  ```

set_power_rail_display

```
set_power_rail_display
[-help]
[-enable_result_browser {true | false}]
[-enable_rlrp {true | false}]
[-enable_voltage_sources {true | false}]
[-filter_max max_value]
[-filter_min min_value]
[-legend {off ne nw se sw}]
[-plot plot_type]
[-range_max max_value]
[-range_min min_value]
[-reset_color_scale {true | false}]
[-filter_color {on | off | color_name}]
[-enable_percentage_range {true | false}]
[-thermal_layer_name thermal_layer]
[-tile_count_x value]
[-tile_count_y value]
[-tile_size_x value]
[-tile_size_y value]
[-customized_range {value1 value2 ... value9}]
[-grid {on | off}]
[-enable_auto_apply {true | false}]
```

Controls the display of the main window widgets, such as legend, result browser, voltage source, filter range, and RLRP path.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_power_rail_results` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_power_rail_results`.

`-customized_range {value1 value2 ... value9}`

Specifies the color scale range values for the 8 filters between the minimum and maximum values of the color gradient based (*Basic*) filter. The value list must contain 9 values.

The filter ranges for the 8 buckets are evenly divided by default. This parameter can be used to customize the filter ranges. You can either modify the color range using the GUI (Basic button) or the `-customized_range` parameter.

Example:

```
set_power_rail_display -plot ir -customized_range { 1 10 12 13 14 15 16 17 49 }
```

`-enable_auto_apply {true | false}`

Specifies to automatically redraw the layout after modifying the color scale range values. This parameter allows you to enable/disable the *Auto Apply for Color Scale* checkbox of the Power Rail Plots form using the Tcl script instead of the GUI option.

The default value of this parameter is `false`.

`-enable_percentage_range {true | false}`

Specifies to display the color gradients for the following plots by percentage in the GUI:

- IR Drop
- IVDD
- IVDN

The percentage value is based on the nominal voltage value of each rail/instance. It displays high percentage voltages in red and low percentage voltages in blue.

Default : `false`

`-enable_result_browser {true | false}`

When set to `true` it enables the result browser.

Default : `false`

`-enable_rlrp {true | false}`

	When set to `true` it enables the display of the RLRP path. The rail analysis must include RLRP analysis (`set_rail_analysis_mode -enable_rlrp_analysis true`) in order to have the required data for this functionality. *Default* : `false`
`-enable_voltage_sources {true | false}`	
	Displays voltage sources (power pads) using white pixels in the layout canvas. *Default* : `false`
`-filter_color {on | off | color_name}`	
	Allows to set the color of the filtered out resistors specified using the scissor filter range. By default, the filtered resistors are not displayed. If you want to view these resistors, you can use this parameter to enable the visibility of resistors and set desired colors for them. The valid values of this parameter are: • `on` – enables the visibility of the filtered out resistors. • `off` - disables the visibility of the filtered out resistors. • *`color_name`* - enables the visibility of filtered out resistors and set the color of resistors per the specified color name.
`-filter_max max_value`	
	Specifies the maximum value of the scissor filter range that will be plotted. You can use the scissor filter range to filter out the resistors and nodes that you do not want to view, and obtain statistics only for the instances in the specified filter range. Optional, but if specified, the `-plot` option is required, and requires both `-filter_min` and `-filter_max` to be specified.
`-filter_min max_value`	
	Specifies the minimum value of the scissor filter range that will be plotted. Optional, but if specified, the `-plot` option is required, and requires both `-filter_min` and `-filter_max` to be specified.
`-grid {on | off}`	

	Allows you to control the grid display when viewing the Voltage Source Current (VC) and Voltage across Package Model (VU) plots. The default value of this parameter is `on`. You can set this parameter to `off` to hide the grid view for better display and easier analysis of the plot data.
`-legend {off ne nw se sw}`	
	Displays the filter color and range details. When you set `set_power_rail_display -legend` to one of the location (`ne nw se sw`) , this opens the legend at the specified location on the design layout. Use `set_power_rail_display -legend off` to close the legend. *Default*: `off` .
`-plot` *plot_type*	
	Plots the specified plot type. See Plot Types for a description of each of the plot types.
`-range_max` *max_value*	
	Specifies the maximum value of the color scale. Optional, but if specified, the `-plot` option is required, and requires both `-range_min` and `-range_max` to be specified.
`-range_min` *min_value*	
	Specifies the minimum value of the color scale. Optional, but if specified, the `-plot` option is required, and requires both `-range_min` and `-range_max` to be specified.
`-reset_color_scale {true | false}`	
	Specifies to reset the maximum (`-range_max`) and minimum (`-range_min`) values of the color scale to the default plot data values. For example, when you specify `-plot ir`, the default value for `-range_min` is `0` and `-range_max` is `100`. You can modify the color scale, such as set `-range_min` to `0` and `-range_max` to `20`. To reset the color scale of the IR drop plot to default, you can specify the `-reset_color_scale` parameter.
`-thermal_layer_name` *thermal_layer*	

	Displays the specified layer of the temperature map. **Example**: `set_power_rail_display -thermal_layer_name VIA_7`
`-tile_count_x` *value*	
	Specifies the number of tiles in the x direction. This parameter is used to resize the tile power density plot. You can either specify the tiles by count (`tile_count_x` and `tile_count_y`) or specify the tiles by size (`tile_size_x` and `tile_size_y`). When you resize the tile power density (`tpd`) plot in the batch or GUI mode, the software automatically invokes the `report_power` command and resizes the plot. This feature allows you to resize the `tpd` plot without having to restore the power database (`power.db`) again.
`-tile_count_y` *value*	
	Specifies the number of tiles in the y direction. This parameter must be specified with the `tile_count_x` parameter.
`-tile_size_x` *value*	
	Specifies the horizontal dimension of each tile polygon in um. This parameter is used to resize the tile power density plot. You can either specify the tiles by count (`tile_count_x` and `tile_count_y`) or specify the tiles by size (`tile_size_x` and `tile_size_y`). When you resize the tile power density (`tpd`) plot in the batch or GUI mode, the software automatically invokes the `report_power` command and resizes the plot. This feature allows you to resize the `tpd` plot without having to restore the power database (`power.db`) again. The following is an example of specifying tiles by size: `set_power_rail_display -plot tpd -tile_size_x 100 -tile_size_y 100`
`-tile_size_y` *value*	
	Specifies the vertical dimension of each tile polygon in um. This parameter must be specified with the `tile_size_x` parameter.

Plot Types

Plot Type	Description
`ac`	Available/feasible capacitance (Farad) Displays the feasible decoupling capacitance that can be added in the area. The feasible capacitance in the area is calculated based on the filler cells placement. The program matches the placed filler cells with the decap cells available in the power-grid library and computes the feasible capacitance. The capacitance of the decap cell is stored in the power-grid library.
`cap`	Ggrid capacitance (Farad) Plots the capacitance of the extracted power-grid network.
`cvi1`	Customized File 1 Plots the user-specified instance voltage file.
`dd`	Decoupling capacitance (decap) density (Farad/um ^{2}) Plots decap density of the design. The decap density is the cell internal decoupling capacitance in the unit area (µm ^{2}).
`dr`	Decoupling capacitance required Reports the decoupling capacitance required to fix dynamic IR-drop violations. This option suggests how much decap needs to be added in a given area to fix the IR-drop violations. The voltage threshold used to determine the IR-drop violations for this analysis is the value specified by the `-threshold` option of the `set_pg_nets` command.
`effr`	Effective resistance (ohm) - instance based Display the effective resistance results for all instances.
`node_reff`	Effective resistance (ohm) - node based Display the effective resistance results for all nodes.
`ipc`	Instance Peak Current Display the peak current of each instance.

`ivdn`	Instance Voltage Drop (Volts) – net-based Plots the net-based instance voltage drop.
`ivdd`	Instance Voltage Drop (Volts) – domain-based Plots the domain-based instance voltage drop. For domain based, at least one power and one ground net must be selected.
`fd`	Filler cell density (1/µm ^{2}) Displays the filler cell density per unit area (µm ^{2}). The plot can be used to analyze the feasibility of adding decap cells by replacing the filler cells and not changing the placement of the logic cells.
`freq`	Frequency domain (Hz) Displays the associated clock frequency of all instances in the design. The instances associated with multiple clock domains are displayed using the fastest clock frequency. This plot can be used to analyze and debug the power distribution in the design.
`ip`	Instance total power (mW) The total power consumed by each instance is displayed. The total power is the sum of the internal, switching and leakage power of the instance. The power data is read from the power database and can be specified using the `-power_db` option or it is queried directly from memory, if power calculation is run during the session.
`ip_i`	Instance internal power (mW) The power consumed by charging and discharging of the internal interconnect and device capacitances of the instance.
`ip_l`	Instance leakage power (mW) The power consumed by devices when not switching.
`ip_s`	Instance switching power (mW) The power consumed by charging and discharging of the interconnect or output load.
`ipd_i`	Specifies internal power density in mW/um ^{2} .

`ipd_l`	Specifies leakage power density in mW/um ^{2} .
`ipd_s`	Specifies switching power density in mW/um ^{2} .
`ipd_t`	Specifies total power density in in mW/um ^{2} .
`ir`	IRdrop or voltage drop (Volts) Displays the IRdrop across each extracted power-grid segment in the design.
`jrms`	Specifies current density as j/jmax based on the Irms current. This plot is only supported for dynamic analysis. A jrms gif file will be saved in the state directory that shows where the Irms based EM violation occurred. This plot type allows you to verify the analysis results of "jrms" using the GUI.
`load`	Loading capacitance (Farad) Displays the output loading capacitance driven by the instance. This plot can be used to analyze and debug the regions with high switching power.
`pi`	Power-switch (gate) current violation: I/Idsat Displays the ratio of current through the power-switch and the saturation current (Idsat) of the power-switch. This plot can be used to analyze and debug whether the current through power-switches exceeds the saturation current characterized for the power-switch devices. The saturation current and on-resistance of the power-switches are characterized and stored inside the power-grid library of the power-switch cell. A ratio of greater than 1 means that the current requirement of the power-gated block can not be met with placed power-switch instance. Either the power-switch needs to be made larger or power-switch instances need to be added.
`ptpd`	Profiling Tile Power Density Displays the tile-based power density plot for the vector profiling flow. You can enable this plot using the `read_power_rail_results -profiling_power_file` *`file`* command. You can also view the power density for the different tile co-ordinates in the *Details* tab of the Result Browser.

`pv`	Voltage drop across power-switch (Volt) Displays the IRdrop across power-switch instances. This plot can be used to analyze and debug the IRdrop inside the power-gated block, e.g. if the IRdrop across power-switches is already high, the IRdrop inside the power-gated block will be much higher. In this case, the power-switch placement will have to be refined in order to resolve the IRdrop problem.
`rc`	Resistor current (Amp) Displays the current across power-grid resistor segments. This plot can be used to analyze and debug how the current flows from the voltage sources into the rest of the design, e.g. high current should flow from pads to the top-level routing level layers and then to the lower level metal layers. This plot can also be used to debug current density violations (`rj`).
`rlrp`	The total resistance of the instance along the least resistive path. Displays the total resistance of the instance along the least resistive path, meaning the resistance of the instance along the path from where it gets the most amount of current. This plot can be used to analyze and debug the power-grid integrity early in the design stage. An instance with high resistance is likely to have high static or dynamic IRdrop depending on the vector that is simulated later in the design cycle. This plot can be also used during decap optimization, since regions with high dynamic IRdrop and high resistance may not be improved upon by adding decaps, because the effectiveness of decoupling capacitance depends on the resistance of the power-grid network. The plot displays the RLRP paths for power (purple color) and ground (white color) nets in different colors for the identification of paths and ease of analysis. You can also highlight the least resistive path of the instance using the GUI and selecting the instance with left mouse button. The *RLRP Path* checkbox should be enabled.

`res`	Grid resistance (ohm) Displays the total resistance of the least resistive path from each node to voltage source. This plot can be used to view high resistance regions of the power-grid. It is useful during IRdrop and decap analysis to identify weak power-grid connectivity. The GUI also allows you to view the resistor-based RLRP path. To view the resistor-based RLRP path: 1. Select the *res* Rail plot, and the *RLRP Path* checkbox. 2. Select a resistor. The GUI highlights the least effective resistance path to the nearest voltage source, and opens the *Resistance Path* form.
`rj`	Resistor current density, J/Jmax. Displays the current density (current per unit area) violation on each power-grid segment using the ratio of calculated current density and maximum allowed current density. A ratio of greater than 1 means that the current density limit of the segment is violated. The current density limits are supplied by the foundry and can be read during analysis using the `set_rail_analysis_mode -em_models` command.
rs	Specifies the plot type for resistor sensitivity.
`sem_avg`	Average Current Density Displays average current limit violations in the design. This plot is enabled when you specify `verifyACLimit -method avg`.
`sem_peak`	Peak Current Density Displays peak current limit violations in the design. This plot is enabled when you specify `verifyACLimit -method peak`.
`sem_rms`	RMS Current Density Displays RMS current limit violations in the design. This plot is enabled when you specify `verifyACLimit -method rms`.
`slack`	Instance slack (Seconds) Displays worst instance slack. The slack data is queried from either the timing database or if the power database is specified using `-power_db` option, then the worst slack data is read from the power database. When using an external TWF, the slack data is read from the TWF.

`tc`	Tap current (Amp) Displays the current consumed by the instance devices or current taps. During rail analysis, it is based on the power consumption of the instance and is distributed inside the cell. The current distribution inside the cell is based on the extracted device netlist stored inside the power-grid library of the cell. The current distribution is generally based on the device width, length, and spice models. This plot can be used to analyze and debug IRdrop inside the macro.
`td`	Transition density (Hz) Displays the worst transition density (activity * frequency) of the instance. This plot can be used to analyze and debug activity distribution and high power density regions.
`thermal`	Instance thermal Displays the instance temperature distribution for the chip. The plot shows tile-based temperature for instances. When you click on an instance, the *Attribute Viewer* window opens and displays the instance temperature in the *Thermal* field.
`unc`	Unconnected segments Displays power-grid segments that are disconnected from the voltage source (power pads). This plot can be used to debug unusually high IRdrop in the region.
`vc`	Voltage source current (Amp) Displays current through the voltage sources (power pads). This plot can be used to analyze the current carrying capacity of the power-pad.
`vu`	Voltage drop across package (Volt) Displays voltage drop across package. If analysis is run with package model attached to the power pads, this plot displays the IRdrop due to package RLCK elements.

Examples

- The following command specifies that `div` data will be plotted without loading design DEF:

  ```
  set_power_rail_display\
  -plot div
  ```

- The following command enables the visibility of the filtered out resistors without changing the color:

  ```
  set_power_rail_display -filter_color on
  ```

- The following command enables the visibility of the filtered out resistors and also changes the color to red:

  ```
  set_power_rail_display -filter_color red
  ```

Related Information

- `set_power_rail_layers_nets`

[-instance_voltage_method {Worst | Best | Avg | WorstAvg}]
[-instance_voltage_window {1| 0}]
[-via_size {1 | 2 | 3 | 4 | 5 | 6}]
```

Controls the visibility of the layers, the opacity of the rail analysis or design database, and the visibility of power/ground nets.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_power_rail_layers_nets` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_power_rail_layers_nets`.
`-design_opacity value`	

	Specifies the design opacity value for the design database. The opacity range is from 0-100%, the default value is `60`.
`-disable_nets {`*`names`*`}`	
	Hides the specified nets. This parameter is mutually exclusive to the `-enable_nets` and `-nets` parameters.
`-disable_report_layers {all|`*`layer_names`*`}`	
	Hides the reporting (user-defined layers to be used for processing) of layers. You can use `all` to hide all layers, or list the specific layers that are not to be displayed. This parameter is mutually exclusive to the `-enable_report_layers` and `-layers` parameters.
`-disable_switch_nets {all|`*`net_names`*`}`	
	Hides the specified switch nets. You can use `all` to hide all the switch nets, or list the specific switch nets that are not to be displayed. This parameter is mutually exclusive to the `-enable_switch_nets` parameter.
`-disable_visible_layers {all|`*`layer_names`*`}`	
	Specifies which layers should not be made visible when plotting. You can use `all` to hide all layers, or list the specific layers that are not to be displayed. This parameter is mutually exclusive to the `-enable_visible_layers` and `-layers` parameters.
`-disable_visible_sem_layers {all|`*`layer_names`*`}`	
	Specifies which signal EM layers should not be made visible when plotting. You can use `all` to hide all layers, or list the specific layers that are not to be displayed. This parameter is mutually exclusive to the `-enable_visible_sem_layers` parameter.
`-enable_nets {`*`names`*`}`	
	Displays only the specified nets. This parameter is mutually exclusive to the `-disable_nets` and `-nets` parameters.
`-enable_report_layers {all|`*`layer_names`*`}`	

	Specifies to select the user-defined layers to be used for processing. You can use `all` to select all layers, or list the specific layers that are to be selected. This parameter is mutually exclusive to the `-disable_report_layers` and `-layers` parameters.
`-enable_switch_nets {all|`*`net_names`*`}`	
	Displays the specified switch nets. You can use `all` to display all the switch nets, or list the specific switch nets that are to be displayed. This parameter is mutually exclusive to the `-disable_switch_nets` parameter.
`-enable_visible_layers {all|`*`layer_names`*`}`	
	Specifies which layers should be made visible when plotting. You can use `all` to display all layers, or list the specific layers that are to be made visible. This parameter is mutually exclusive to the `-disable_visible_layers` and `-layers` parameters.
`-enable_visible_sem_layers {all|`*`layer_names`*`}`	
	Specifies which signal EM layers should be made visible when plotting. You can use `all` to select all layers, or list the specific layers that are to be selected. This parameter is mutually exclusive to the `-disable_visible_sem_layers` parameter.
`-instance_voltage_method {Worst | Best | Avg | WorstAvg}`	
	Allows different methods of computing effective instance voltage during rail analysis. Using this option, you can write out the Best, Worst, or Average effective instance voltage between power and ground nets. The WorstAvg method computes the average instance voltage during each evaluation window defined by the IV Window field, and reports the worst average instance voltage out of all the windows. If IV Method is WorstAvg and IV Window is whole, then this method will report average voltage across all time steps in simulation. Default : `Worst`
`-instance_voltage_window {1| 0}`	

	Controls the EIV plot. EIV is obtained by processing the voltage waveforms and finding the worse-case effective voltage between the power and ground pins during a specific window. There are two options to view EIV plots: • `1` – both switching and timing windows (window EIV) • `0` – worst of the entire rail simulation (worst EIV)
`-layers {{name report0/1 visible0/1}{...}}`	
	Controls the visibility of layers. You can enable or disable the reporting and visibility of specific layer. For example, `-layer {{M1 1 1} {M2 0 0}` means enable reporting and visibility of layer M1, and disable reporting and visibility of layer M2 This parameter is mutually exclusive to the `-disable_report_layers, -disable_visible_layers, -enable_visible_layers,` and `-enable_report_layers` parameters.
`-nets {{all_power 0/1}{all_ground 0/1}}`	
	Controls the display of all the power and ground nets. When `all_power` is set to `0`, hides all power nets, and when set to `1`, displays all power nets. When `all_ground` is set to `0`, hides all ground nets, and when set to `1`, displays all ground nets. This parameter is mutually exclusive to the `-enable_nets` and `-disable_nets` parameters.
`-rail_analysis_opacity` *value*	
	Specifies the opacity value for the rail analysis output. The opacity range is from 0-100%, the default value is `100`.
`-show_layer_net_setting_list {true | false}`	

	Displays the current status (OFF/ON) of all layers and nets in the console. The following is an example of the output:
	`#-------------------------------#`
	`# Layers   Report    Visible #`
	`# RD         ON          ON #`
	`# M0         ON          ON #`
	`.....`
	`#-------------------------------#`
	`# PowerNets  Status #`
	`# VDD           ON #`
	`# VDDm          ON #`
	`#-------------------------------#`
	`# GroundNets Status #`
	`# VSS          ON #`
	`#-------------------------------#`

`-via_size {1 | 2 | 3 | 4 | 5 | 6}`	
	Specifies to modify and control the size of vias in the GUI. The default via size is `1`. The possible via size values are `1`, `2`, `3`, `4`, `5`, and `6`.

Examples

- The following command specifies the layers that will be visible:

```
set_power_rail_layers_nets \
 -enable_visible_layers{RD M1 V12 M2 V23 M3 V34 M4 V45 M5 V56 M6} \
 -enable_nets {vdd vdd_1}
```

- The following commands describe the use model for enabling and disabling switch nets. Here, consider a net `VDD` with three switch nets `VDD_sw0`, `VDD_sw1`, and `VDD_sw2`:
  - The following command hides the switch net VDD_sw0:
    set_power_rail_layers_net `-disable_switch_nets {VDD {VDD_sw0}}`
    Displays `VDD_sw1` and `VDD_sw2`.
  - The following command hides all the switch nets:

    ```
    set_power_rail_layers_net -disable_switch_nets {VDD {all}}
    ```

  - The following command displays the switch net `VDD_sw0`:

    ```
    set_power_rail_layers_net -enable_switch_nets {VDD {VDD_sw0}}
    ```

  - The following command displays all the switch nets:

    ```
    set_power_rail_layers_net -enable_switch_nets {VDD {all}}
    ```

- `set_power_rail_display`
- "Static Power, IRdrop and EM Analysis" in the *Voltus IC Power Integrity Solution User Guide*

set_visible_bumps

```
set_visible_bumps
[-help]
{-bump_cells bump_cell_name| -all}
```

Displays only the bumps with the specified bump cell names and hides all other bumps.

To redisplay all bumps, specify the `-all` parameter.

Parameters

`-help`	Prints a brief description that includes type and default information for each `set_visible_bumps` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_visible_bumps`
`-all`	Displays all bumps. ⚠ By default, all bumps are displayed. When you specify `set_visible_bumps bump_cell_name`, the tool displays only the bumps with the specified bump cell names and hides all other bumps. You can then use `set_visible_bumps -all` to redisplay all bumps.
`-bump_cells` *names*	Displays only the bumps with the specified bump cell names and hides all other bumps. You can specify multiple bump cell names.

Examples

- The following command displays only the bumps with bump cell as BUMPCELL:
  ```
  set_visible_bumps -bump_cells BUMPCELL
  ```
- The following command redisplays all bumps:
  ```
  set_visible_bumps -all
  ```

Related Information

- get_visible_bumps

set_visible_netGroups

```
set_visible_netGroups
[-help]
{netGroups | -all}
```

Displays only the specified netGroups and hides all other netGroups.

To display all netGroups, specify the `-all` parameter.

Parameters

`-help`	Prints a brief description that includes type and default information for each `set_visible_netGroups` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_visible_netGroups`
`-all`	Displays all the netGroups.
`netGroups`	Displays only the specified netGroups and hides all other netGroups. You can specify multiple netGroup names.

Examples

- The following command hides all netGroups except the specified one:
  ```
  set_visible_netGroups test_ng
  ```

Related Information

- `get_visible_netGroups`

set_visible_nets

```
set_visible_nets
[-help]
{nets | -all}
```

Displays only the specified nets and hides all other nets.

To display all nets, specify the `-all` parameter.

Parameters

`-help`	Prints a brief description that includes type and default information for each `set_visible_nets` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_visible_nets`
`-all`	Displays all nets.
nets	Displays only the specified nets and hides all other nets. You can specify multiple net names.

Examples

- The following command hides all nets except the specified net:
  ```
  set_visible_nets inst1/lower/net_1
  ```

Related Information

- `get_visible_nets`

setDefaultWorkspace

```
setDefaultWorkspace
[-help]
-name workspaceName
[-dir directory]
```

Sets specified workspace as the default. The default workspace is loaded automatically when the software starts. So if you want Innovus to load a workspace automatically at startup, you need to first save it as default.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setDefaultWorkspace` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setDefaultWorkspace`
`-name` *`workspaceName`*	Specifies the name of the workspace to be set as default.
`-dir` *`directory`*	Specifies the location of the workspace to be set as default.

Example

The following example sets the `TestWorkspace` workspace in the current working directory as default.

```
setDefaultWorkspace -name TestWorkspace
```

Related Information

- `deleteWorkspace`
- `loadWorkspace`
- `saveWorkspace`
- Windows Menu chapter of the *Menu Reference*
    - *Workspaces*

setHInstColorId

```
setHInstColorId
[-help]
hInstName
colorID
[-descendant]
```

Specifies the color ID for a hierarchical instance.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setHInstColorId` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setHInstColorId`
`hInstName`	Name of the hierarchical instance to which this color ID applies.
`colorID`	Specifies the color ID from `0` to `29`. The color value for the color id is the same as specified in the Module Color Preferences form (accessed by clicking *Floorplan - Edit Floorplan - Color Module*).
`-descendant`	Specifies that the color ID should be applied to the child/descendant instances as well. *Default*: If no ID is specified, the color id is applied only for the top-level instance.

Example

The following command applies color ID `3` to the hierarchical instance `topModule`:

```
setHInstColorId topModule 3
```

Related Information

- `resetMultiColorsHier`

- Floorplan Menu chapter in the *Menu Reference*
    - *Color Module*

setMultiColorsHier

```
setMultiColorsHier
[-help]
[colorID [hInstName]]
```

Specifies the color assignment for hierarchical instances based on the color Id from the Module Color Preference form (accessed by clicking *Floorplan - Edit Floorplan - Color Module*).

Parameters

`-help`	Prints a brief description that includes type and default information for each `setMultiColorsHier` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setMultiColorsHier`
`colorID`	Specifies an integer from `0` to `29` to set the starting color ID for the specified hierarchical instance. *Default*: If no ID is specified, the color ID `0` in the Module Color Preference form is applied to the selected hierarchical instances. This is the same behavior as using the *Auto* button on the Module Color Preference form.
`hInstName`	Specifies the name of the hierarchical instance whose descendants are set to the specified color ID. *Default*: if this parameter is not specified, the first hierarchical instance uses the specified color id; the second hierarchical instance uses the next color ID, and so on.

Examples

- The following command specifies the color Id 3 for the first hierarchical module, the color Id 4 for the second hierarchical module, and so on.

  ```
  setMultiColorsHier 3
  ```

- In the following command, only the descendants of `topModule` are displayed using the color ID `3`.

  ```
  setMultiColorsHier 3 topModule
  ```

setSelectedPtnCut

```
setSelectedPtnCut
[-help]
X1 Y1 X2 Y2
PartitionName
```

Sets the area and the name for the selected partition cut area.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setSelectedPtnCut` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setSelectedPtnCut`
X1 Y1 X2 Y2	Specifies the coordinates of the partition cut area.
PartitionName	Specifies the name of the partition cut area.

Related Information

- `setSelectedPtnFeedthrough`
- `setSelectedPtnPinBlk`
- `setSelectedPtnPinGuide`

setSelectedPtnFeedthrough

```
setSelectedPtnFeedthrough
[-help]
x1 y1 x2 y2
PtnFeedthroughName
{ layerID | layerIDList }
```

Sets the area, name, and layer ID for the selected partition routing feedthrough object.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setSelectedPtnFeedthrough` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setSelectedPtnFeedthrough`
x1 y1 x2 y2	Specifies the coordinates of the routing feedthrough area.
PtnFeedthroughName	Specifies the name of the routing feedthrough.
layerID | *layerIDList*	Specifies the metal layer(s) that can route through the partition feedthrough.

Example

- The following command sets the routing feedthrough object, `ptnFeedthru2`, to allow routing on the layer `5` (Metal5) to cross over the specified area:

  ```
  setSelectPtnFeedthrough 100.0 100.0 150.0 150.0 ptnFeedthru2 5
  ```

Related Information

- `setSelectedPtnCut`
- `setSelectedPtnPinBlk`
- `setSelectedPtnPinGuide`

setSelectedPtnPinBlk

```
setSelectedPtnPinBlk
[-help]
x1 y1 x2 y2
PtnPinBlkName
{layerID}
```

Sets the area, name, and layer ID for the selected partition pin blockage.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setSelectedPtnPinBlk` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setSelectedPtnPinBlk`
x1 y1 x2 y2	Specifies the coordinates of the partition pin blockage area.
PtnPinBlkName	Specifies the name of the partition pin blockage.
layerID	Specifies the metal layer(s) where partition pins are not to be created.

Example

- The following command sets the partition pin blockage, `ptnPinBlk2`, within the specified area and on the layers `4` (Metal4), `5` (Metal5), and `6` (Metal6):

  ```
  setSelectedPtnPinBlk 100.0 100.0 150.0 150.0 ptnPinBlk2 {4 5 6}
  ```

Related Information

- `setSelectedPtnCut`
- `setSelectedPtnFeedthrough`
- `setSelectedPtnPinGuide`

setSelectedPtnPinGuide

```
setSelectedPtnPinGuide
[-help]
x1 y1 x2 y2
ptnPinObj
layerID
space
[cellName]
```

Sets area, name, and layer Id for the selected pin guide object.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setSelectedPtnPinGuide` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setSelectedPtnPinGuide`
x1 y1 x2 y2	Specifies the coordinates of the pin guide area.
ptnPinObj	Specifies the name of the net, net group, or pin group associated with this pin guide
layerID	Specifies the metal layer(s) for the pin guide.
space	Specifies spacing for the pin guide.
cellName	This parameter is required only if the object specified with the *ptnPinObj* parameter is a pin group. Specifies the name of the cell with which the pin group is associated.

Example

- The following command sets the partition pin guide, `ptnGuide2`, within the specified area and on the layers `2` (Metal2) and `3` (Metal3) with pin guide spacing as `0` and associated with the cell `cell1`:

  ```
  selectPtnPinGuide 100.0 100.0 150.0 150.0 pinGuide2 {2 3} 0 {cell1}
  ```

Related Information

- `setSelectedPtnCut`
- `setSelectedPtnFeedthrough`
- `setSelectedPtnPinBlk`

setSelectedWireState

```
setSelectedWireState
[-help]
index
value
```

Sets the state of the selected wire.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setSelectedWireState` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setSelectedWireState`
index	Specifies which selected wire shape needs to be set.
value	Specifies the state to be set for the selected wire. You can specify one of the following values: • `ROUTED` • `FIXED` • `COVER` • `NOSHIELD` • UNKNOWN

Related Information

- The wire section in the Innovus Database Object Information manual
- Editing Wires chapter of the *User Guide*

setSelHInstColor

```
setSelHInstColor
[-help]
[colorID]
```

Specifies the color Id for the selected hierarchical instances.

Parameters

`-help`	Prints a brief description that includes type and default information for each `setSelHInstColor` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setSelHInstColor`
`colorID`	Specifies the color Id to apply to all selected hierarchical instances. The color value for the color id is the same as specified in the Module Color Preference form (accessed by clicking *Floorplan - Edit Floorplan - Color Module*) *Default*: If no Id is specified, the color Id `0` is applied to all the selected hierarchical instances.

Example

The following command applies color Id 5 to all the selected hierarchical instances:

```
setSelHInstColor 5
```

Related Information

- `resetMultiColorsHier`
- `saveColorPreference`
- `saveHInstColor`
- `setHInstColorId`
- `setMultiColorsHier`
- `set_object_color`
- Floorplan Menu chapter in the *Menu Reference*
  - *Color Module*

ui_view_box

```
ui_view_box [-help]
```

Reports the coordinates of the current area being viewed in the GUI.

Parameters

`-help`	Prints out the command usage. For a detailed description of the command, use the `man` command: `man ui_view_box`

Example

The following command reports the coordinates of the current area being viewed in the GUI:

```
innovus 9> ui_view_box

93.367 -646.465 103.294 -638.724
```

Related Information

- `zoomBox`

uiAdd

```
uiAdd
[-help]
name
[-before name]
[-checked {true | false}]
[-command string]
[-disabled {true | false}]
[-enablevar string]
[-foreground string]
[-icon filename]
[-in name]
[-label string]
[-movable {true | false}]
[-newline {true | false}]
[-shortcut string]
[-tooltip string]
-type {menu | toolbar | submenu | command | check | radio | separator | toolbutton}
[-underline integer]
[-value string ]
[-variable string]
[-visiblevar string]
```

Adds a new interface element with the specified name of the specified type. Use this command to customize the Innovus graphical interface by adding menus, toolbars, status bar, and other interface elements, as required.

Parameters

`-help`	Prints a brief description that includes type and default information for each `uiAdd` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man uiAdd`

name	Specifies as a string the internal name of the interface element you want to add. **Note:** Choose the internal name of the element carefully as this is what is used internally by the software to identify the element for any further manipulation.
-before *name*	When specified, adds the new element before the element identified by *name*.
-checked {true | false}	Specifies whether or not the check box or radio button you are adding should be checked. **Note:** You can use the -checked parameter only if you are adding elements of type check or radio. *Default*: false
-command *string*	Specifies the Tcl command to be executed when the element you are adding is invoked. **Note:** You can use the -command parameter only if you are adding elements of type command, check, radio or toolbutton.
-disabled {true | false}	Specifies the state of the interface element you are adding. **Note:** You can use the -disabled parameter only if you are adding elements of type menu, submenu, command, check, radio or toolbutton. The parameter is NOT applicable for elements of type toolbar and separator. *Default*: false
-enablevar *string*	Represents the Tcl global variable for Enable status.
-foreground *string*	Specifies foreground color of the icon. **Note:** You can use the -foreground parameter only if you are adding an element of type toolbutton.

`-icon` *`filename`*	When adding a toolbutton, specifies the file name of the toolbutton icon. *`filename`* can be the full path of the icon file or an icon name supported by Innovus. The icon names used in Innovus can be queried using the `uiGet` command. For list of supported image formats for the icon file, see the "Supported Image Formats" section of the Customizing the User Interface chapter in the *Innovus User Guide*. **Note:** The `-icon` parameter is applicable only for elements of type `toolbutton`.
`-in` *`name`*	Specifies the name of the parent element. Use this parameter along with `-before` to specify the location of the element you are adding. By default, `-in` adds the element to the end of the parent element. Use `-before` to add the element at a specific location within the parent element. **Note:** If `-in` is not specified, the new element is created but is not added to any location.
`-label` *`string`*	Specifies the label to be displayed on the new element. **Note:** This parameter is NOT applicable for elements of type `separator`.
`-movable {true | false}`	When adding a toolbar, specifies whether or not it will be movable.
`-newline {true | false}`	When adding a toolbar, specifies whether or not the toolbar should be added as a new row. **Note:** The `-newline` parameter is applicable only for elements of type `toolbar`. *Default*: `false`
`-shortcut` *`string`*	Specifies the shortcut key for a command, check box, radio button, or toolbutton. **Note:** You can use the `-shortcut` parameter only if you are adding elements of type `command`, `check`, `radio`, or`toolbutton`.

`-tooltip` *`string`*	Specifies the tooltip text for the toolbar or toolbutton you are adding. **Note:** The `-tooltip` parameter is applicable only for elements of type `toolbar` and `toolbutton`.
`-type {menu | toolbar | submenu | command | check | radio | separator | toolbutton}`	
	Specifies the type of the interface element you want to add. Currently, elements of type `main` and `statusbar` are not supported.
`-underline` *`integer`*	Specifies the integer index of the character to be underlined in the element label. The index begins with `0` and should have a value less than or equal to the length of the element label. For instance, if you want the second letter of the element label to appear underlined, specify *`integer`* as `1`. **Note:** The `-underline` parameter is NOT applicable for elements of type `toolbar, separator,` and `toolbutton`. **Note:** This parameter can be used only if the `-label` parameter is also specified.
`-value` *`stringValue`*	When adding a radio button, specifies the value to be stored in the associated variable when the radio button is selected. **Note:** The `-value` parameter is applicable only for elements of type `radio`.
`-variable` *`string`*	When adding a check box or radio button, specifies the Tcl global variable for the item.
`-visiblevar` *`string`*	Represents the Tcl global variable for Visible status

Examples

- The following command will add a new menu labeled *ExampleMenu* in the main window:
  ```
  uiAdd exmpMenu -type menu -label ExampleMenu -in main
  ```
- The following command will add a new menu item labeled *ExampleCommand* in *ExampleMenu*:

```
uiAdd exmpCommand -type command -label ExampleCommand -in exmpMenu -command [list
puts Example Command]
```

- The following command adds a new, unmovable toolbar to the layout window:
  ```
  uiAdd newTB -type toolbar -in main.layout -movable false
  ```

Related Information

  - *Adding a Menu Element to an Existing Menu*
  - *Replacing an Existing Menu Element*
  - *Adding a New Toolbar or Toolbutton*

uiDelete

```
uiDelete
[-help]
name
```

Deletes an existing interface element with the specified name. If multiple interface elements are found with the same name, the first matched element is deleted. Use this command to customize the Innovus graphical interface by removing menus, menu items, and other interface elements that you do not require any longer.

Parameters

`-help`	Prints a brief description that includes type and default information for each `uiDelete` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man uiDelete`
`name`	Specifies the internal name of the interface element as a string. An error is returned if an interface element with the specified name does not exist. **Note:** Here, *`name`* represents the internal name assigned to the element when it was added to the interface and not the label that is displayed on the interface. If you specify the label instead of the name, the software will return an error.

Examples

- The following command will delete an interface element with the internal name *`Menu1`*:

  ```
  uiDelete Menu1
  ```

Related Information

- `uiAdd`
- `uiFind`
- `uiGet`
- `uiSet`
- Customizing the User Interface chapter in the *User Guide*
    - *Replacing an Existing Menu Element*

uiFind

```
uiFind
[-help]
[name]
[property {value}]
```

Enables you to retrieve an element's name by specifying a property-value combination.

Parameters

`-help`	Prints a brief description that includes type and default information for each `uiFind` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man uiFind`
`name`	Specifies the name of the parent element to define the search scope. If multiple elements are found with the same *`name`*, the first matched element is searched. If *`name`* is not specified, a global search is performed.
`property {value}`	Specifies the property-value combination that should be used as the search criteria for finding an element. In addition to all the properties listed in the `uiAdd` command, `-type` *`type`* is also supported. To see the list of properties supported by the `uiAdd` command, see `uiAdd`.

Examples

- The following command returns the names of all the menus in the main window:
  ```
  uiFind main -type menu
  ```
  The software returns the following:
  ```
  file view edit partition fplan power place eco clock route timing verify pvs tools
  windows flow help
  ```
- The following command returns the name of the element before the Help menu in the main window:

```
uiFind -before help
```

The software returns the following:

```
flow
```

- The following command returns the name of the element with a label "*CCOpt Clock Tree Debugger...*" on the menu in the main window:

  ```
  uiFind -label "CCOpt Clock Tree Debugger..."
  ```

  The software returns the following:

  ```
  _CCOpt_Clock_Tree_Debugger...
  ```

  You can then get any property of the element by using `uiGet`. For example:

  ```
  uiGet _CCOpt_Clock_Tree_Debugger... -command
  ```

  The software returns the following:

  ```
  ctdMainWin::createSetting
  ```

  Here, `ctdMainWin::createSetting` is the command that is invoked when the menu item labeled *CCOpt Clock Tree Debugger...* is clicked.

- The following command returns all movable toolbars in the main window:

  ```
  uiFind -movable true
  ```

  The software returns the following:

  ```
  tbFile tbEdit tbView tbTools tbReport tbToolBox we main.layout.selectbar
  ```

Related Information

- `uiAdd`
- `uiDelete`
- `uiGet`
- `uiSet`
- Customizing the User Interface chapter in the *User Guide*
  - *Querying and Configuring Interface Elements*

uiGet

```
uiGet
[-help]
[name]
[-quiet]
[ -before | -checked | -children | -command
  | -disabled | -dockwin | -enablevar | -foreground
  | -geometry | -icon | -in | -label | -menu
  | -message | -movable | -newline | -shortcut
  | -statusbar | -title | -toolbar | -tooltip
  | -type | -underline | -value | -variable
  | -visible | -visiblevar | -windowstatus ]
```

Retrieves the current value of the specified property of the element that is being queried. Using the `uiGet` command, you can query all the properties in the `uiAdd` command for each type. In addition, depending on the `type`, some special properties are supported too as described below:

- For elements of type `menu/submenu/toolbar`:
  - `uiGet name -children`
    Returns a list of all the child elements of the specified interface element.
- For `main` (main window):
  - `uiGet main -menu`
    Returns a list of all the menus in the main window.
  - `uiGet main.layout -toolbar`
    Returns the list of all the toolbars in the main window.
  - `uiGet main -statusbar`
    Returns the status bar in the main window.
  - `uiGet main -geometry`
    Returns the geometry of the main window in the format *width*x*height*+*x*+*y*.
  - `uiGet main -title`
    Returns the title of the main window.
  - `uiGet main -closecmd`
    Returns the close confirmation command of the main window.
  - `uiGet main -visible`

Returns the visibility status of the main window.

- For `statusbar`:
  - `uiGet name -message`
    Returns the current message of the status bar.
  - `uiGet name -visible`
    Returns the visibility status of the status bar.
  - `uiGet name -in`
    Returns the parent element of the status bar.

The statusbar also supports the `-enablevar` and `-visiblevar` parameters.

Parameters

`-help`	Prints a brief description that includes type and default information for each `uiGet` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man uiGet`
`name`	Specifies as a string the name of the interface element you want to query. If multiple widgets are found with the same *`name`*, the first matched widget is queried. Returns an error if there is no element with the specified name.
`-before` *`name`*	When specified, returns the element that occurs before the element identified by *`name`*.
`-checked`	Returns the on/off state of the specified check box or radio button. If the check box or radio button is selected, returns `true`. If it is deselected, returns `false`.
`-children`	Returns child elements of specified interface element. **Note:** You can use this parameter with elements of type `menu`, `submenu`, and `toolbar`.

`-command`	Returns the Tcl command to be executed when the specified element you are adding is invoked. **Note:** You can use the `-command` parameter only with elements of type `command, check, radio` or `toolbutton`.
`-disabled`	When specified, returns whether the specified interface element is enabled (`false`) or disabled (`true`). **Note:** You can use the `-disabled` parameter only with elements of type `menu, submenu, command, check, radio` or `toolbutton`. The parameter is NOT applicable for elements of type `toolbar` and `separator`.
`-dockwin`	Returns the dockwidget.
`-enablevar`	Represents the Tcl global variable for Enable status.
`-foreground`	Returns the foreground color of the icon for the specified toolbutton. **Note:** You can use the `-foreground` parameter only with elements of type `toolbutton`.
`-geometry`	Returns the width, height, and coordinates of the main window. **Note:** The `-geometry` parameter is applicable only for the main window, which is type `main`.
`-icon`	Returns the file name of the specified toolbutton. **Note:** The `-icon` parameter is applicable only for elements of type `toolbutton`.
`-in`	Returns the name of the parent element.
`-label`	Returns the label of the specified element. **Note:** This parameter is NOT applicable for elements of type `separator`.
`-menu`	Returns the names of the menus in the main window. **Note:** This parameter is applicable only for the main window, which is type `main`.

`-message`	Returns the message on the status bar. **Note:** This parameter is applicable only for the status bar.
`-movable`	Returns whether or not the specified toolbar is movable. **Note:** The `-movable` parameter is applicable only for elements of type `toolbar`.
`-newline`	Returns whether or not the specified toolbar starts in a new row. **Note:** The `-newline` parameter is applicable only for elements of type `toolbar`.
`-quiet`	Displays the current settings for the specified parameters in the Tcl list format.
`-shortcut`	Returns the shortcut key for a command, check box, radio button, or toolbutton. **Note:** You can use the `-shortuct` parameter only with elements of type `command`, `check`, `radio`, or `toolbutton`.
`-statusbar`	Returns the name of the main window's status bar. **Note:** This parameter is applicable only for the main window (`main`).
`-title`	Returns the text on the main window's title bar. **Note:** This parameter is applicable only for the main window (`main`).
`-toolbar`	Returns the toolbars in the window.
`-tooltip`	Returns the tooltip text for the specified toolbar or toolbutton. **Note:** The `-tooltip` parameter is applicable only for elements of type `toolbar` and `toolbutton`.
`-type`	Returns the type of the specified element.
`-underline`	Returns the integer index of the underlined character in the element label. **Note:** The `-underline` parameter is NOT applicable for elements of type `toolbar`, `separator`, and `toolbutton`.

`-value`	Returns the value stored in the associated variable of the specified radio button. **Note:** The `-value` parameter is applicable only for elements of type `radio`.
`-variable`	Returns the Tcl global variable for the specified check box or radio button.
`-visible`	Returns the visibility status of the element.
`-visiblevar`	Represents the Tcl global variable for Visible status

`-windowstatus`	Returns the widget window status. This option returns one of the following values, depending on the window status, assuming that tool was launched in the GUI mode:
	• `Minimized`
	• `Maximized`
	• `Normal`
	For example, if the main window is in the default window mode, and you run the following command:
	`uiGet main -windowstatus`
	the software returns:
	`Normal`
	If the window is in the background, you can use the following command to bring the window to the forefront:
	`uiSet main -visible 1`

Examples

- The following command returns the label on element named verify:

  ```
  uiGet verify -label
  ```

  The software returns the following:

  ```
  Verify
  ```

- The following command returns the names of all the menus in the main window:

  ```
  uiGet main -menu
  ```

  The software returns the following:

  ```
  file view edit partition fplan power place eco clock route timing verify pvs tools
  windows flow help
  ```

- The following command returns the names of all the toolbars in the main layout:

  ```
  uiGet main.layout -toolbar
  ```

  The software returns the following:

  ```
  tbFile tbEdit tbView tbTools tbReport tbToolBox we main.layout.selectbar
  ```

- The following command returns whether the Select bar in the main layout is movable:

  ```
  uiGet main.layout.selectbar -movable
  ```

- The following command returns the window status of the main window:

  ```
  uiGet main -windowstatus
  ```

  The software returns the following (assuming the window is in the maximized mode at the time):

  ```
  Maximized
  ```

uiSet

```
uiSet
[-help]
name
[-before name]
[-checked {true | false}]
[-command string]
[-disabled {true | false}]
[-enablevar string]
[-foreground string]
[-geometry string | -fullscreen {true | false}]
[-icon filename]
[-in name]
[-label string]
[-message string]
[-movable {true | false}]
[-newline {true | false}]
[-shortcut string]
[-statusbar string]
[-title string]
[-tooltip string]
[-underline integer]
[-value string ]
[-variable string]
[-visible {true | false}]
[-visiblevar string]
```

Sets the specified property of an element. Use this command to customize the Innovus graphical interface by configuring various interface elements, such as submenus and commands. The properties that can be set for a specific element depends on the `type` of that element. To see the list of properties that can be set for each type, see the "Accepted Properties for Each Type" section below.

For elements of type `menu, submenu, command, check, radio, separator, toolbar,` and `toolbutton`, the `uiSet` command works like the tk command *`widget`*`configure`. For the main window (`main`), it works like the tk command `wm`.

Parameters

`-help`	Prints a brief description that includes type and default information for each `uiSet` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man uiSet`
`name`	Specifies the name of the element whose property is to be set. An error is returned if specified *`name`* does not exist.
`-before` *`name`*	Sets the specified element before the element identified by *`name`*.
`-checked {true | false}`	Checks or unchecks the specified element. **Note:** You can use the `-checked` parameter only for elements of type `check` or `radio`.
`-command` *`string`*	Specifies the Tcl command to be executed when the specified element is invoked. **Note:** You can use the `-command` parameter only if you are adding elements of type `command, check, radio` or `toolbutton`.
`-disabled {true | false}`	Disables or enables the specified interface element. **Note:** You can use the `-disabled` parameter only for elements of type `menu, submenu, command, check, radio` or `toolbutton`. The parameter is NOT applicable for elements of type `toolbar` and `separator`.
`-enablevar` *`string`*	Sets the Tcl global variable for Enable status.
`-foreground` *`string`*	Specifies the foreground color of the icon of the specified interface element. **Note:** You can use the `-foreground` parameter only if you are adding an element of type `toolbutton`.
`-fullscreen {true | false}`	
	Maximizes the main window. This property can be set only for the element `main`. **Note:** This option cannot be used with `-geometry`.

`-geometry` *`string`*	Modifies the geometry of the specified window element.
`-icon` *`filename`*	Specifies the file name of the toolbutton icon. *`filename`* can be the full path of the icon file or an icon name supported by Innovus. The icon names used in Innovus can be queried using the `gui_get_ui` command. For list of supported image formats for the icon file, see the "Supported Image Formats" section of the Customizing the User Interface chapter in the *User Guide*. **Note:** The `-icon` parameter is applicable only for elements of type `toolbutton`.
`-in` *`name`*	Specifies the name of the parent element.
`-label` *`string`*	Specifies the label to be displayed on the element being modified. **Note:** This parameter is NOT applicable for elements of type `separator`.
`-message` *`string`*	Specifies the message to be displayed on the element being modified. **Note:** This parameter is applicable for elements of type `statusbar`.
`-movable {true | false}`	Specifies whether or not the element being modified should be movable. **Note:** The `-movable` parameter is applicable only for elements of type `toolbar`.
`-newline {true | false}`	Specifies whether or not the element being modified should be on a new row. **Note:** The `-newline` parameter is applicable only for elements of type `toolbar`.
`-shortcut` *`string`*	Specifies the shortcut key for a command, check box, radio button, or toolbutton. **Note:** You can use the `-shortcut` parameter only if you are modifying elements of type `command`, `check`, `radio`, or `toolbutton`.
`-statusbar` *`string`*	Sets the statusbar of the specified window element.

`-title` *string*	Specifies the window title.
`-tooltip` *string*	Specifies the tooltip text for the toolbar or toolbutton you are adding. **Note:** The `-tooltip` parameter is applicable only for elements of type `toolbar` and `toolbutton`.
`-underline` *integer*	Specifies the integer index of the character to be underlined in the element label. The index begins with `0` and should have a value less than or equal to the length of the element label. For instance, if you want the second letter of the element label to appear underlined, specify *integer* as `1`. **Note:** The `-underline` parameter is NOT applicable for elements of type `toolbar, separator,` and `toolbutton`.
`-value` *stringValue*	Specifies the value to be stored in the associated variable when the specified radio button is selected. **Note:** The `-value` parameter is applicable only for elements of type `radio`.
`-variable` *string*	When modifying a check box or radio button, specifies the Tcl global variable for the item.
`-visible {true | false}`	Specifies the visibility status of the element being modified.
`-visiblevar` *string*	Sets the Tcl global variable for Visible status.

Accepted Properties for a Specific Type

- For the main window (`main`), the following properties can be set:

  `-geometry {`*`widthxheight | widthxheight+x+y`*`}`

  `-title` *`title`*

  `-visible true | false`

- For a status bar (`statusbar`), the following property can be set:

  `-enablevar` *`string`*

  `-in` *`parentname`*

  `-message` *`msg`*

  `-visible true | false`

  `-visiblevar` *`string`*

- For elements of type `menu` or `submenu`, the following properties can be set:

  `-enablevar` *`string`*

  `-before` *`nextSiblingName`*`]`

  `-disabled true | false`

  `-in` *`parentName`*

  `-label` *`label`*

  `-underline` *`index`*

  `-visible true | false`

  `-visiblevar` *`string`*

- For elements of type `command`, `radio`, and `check`, the following properties can be set:

  `-disabled true | false`

  `-label` *`label`*

  `-underline` *`index`*

  `-command` *`commandName`*

  `-in` *`parentName`*

  `-before` *`nextSiblingName`*

  `-enablevar` *`string`*

  `-visible true | false`

  `-visiblevar` *`string`*

  `-shortcut` *`string`*

For `radio` and `check`, the `-checked` and `-variable` properties can also be set.

- For elements of type `toolbutton`, the following properties can be set:

```
-state normal | disabled
-label label
-tooltip toolTipText
-underline index
-foreground colorName
-icon iconName
-command commandName
-in parentName
-before nextSiblingName
-enablevar string
-visible true | false
-visiblevar string
-shortcut string
```

Examples

- The following command changes the label of the *Verify* menu in the main window to *NewVerify*:

```
uiSet verify -label NewVerify
```

- The following command maximizes the Innovus main window:

```
uiSet main -fullscreen
```

uiSetTool

```
uiSetTool
[-help]
mode
```

Selects specified tool widget in the main window and enters interactive mode.

For more information on tool widgets, see the "Tool Widgets" section in the The Main Window chapter of the *Innovus Menu Reference*.

Parameters

`-help`	Prints a brief description that includes type and default information for each uiSetTool parameter. For a detailed description of the command and all of its parameters, use the man command: man uiSetTool.
mode {select | move | ruler | util | cut | obstruct | layerBlk | ptnFeed | ptnPinBlk | ptnPinGuide | addWire | addVia | cutWire | stretchWire | addPoly | addBusGuide | p2pRoute}	
	Specifies the interactive mode to enter. The following modes are supported: • `select` - Chooses the Select tool widget in the main window. • `move` - Selects the Move/Resize/Reshape tool widget in the main window. • `ruler` - Selects the Create Ruler tool widget in the main window. • `util` - Selects the Query Area Density tool widget in the main window. • `cut` - Selects the Cut Rectilinear tool widget in the main window. • `obstruct` - Selects the Create Placement Blockage widget in the main window. • `layerBlk` - Selects the Create Routing Blockage tool widget in the main window. • `ptnFeed` - Selects the Create Physical Feedthrough tool widget in the main window. • `ptnPinBlk` - Selects the Create Pin Blockage tool widget in the main window. • `ptnPinGuide` - Selects the Create Pin Guide tool widget in the main window. • `addWire` - Selects the Edit Wire tool widget in the main window. • `addVia` - Selects the Add Via tool widget in the main window. • `cutWire` - Selects the Cut Wire tool widget in the main window. • `stretchWire` - Selects the Move/Resize Wire tool widget in the main window. • `addPoly` - Selects the Add Polygon tool widget in the main window. • `addBusGuide` - Selects the Edit Bus Guide tool widget in the main window. • `p2pRoute` - Selects the Point to Point Route tool widget in the main window.

Example

The following command is used to enter the Create Ruler mode in the design window.

```
uiSetTool ruler
```

undo

```
undo [-help]
```

Undoes the previous edit made with any bump placement, floorplanning, power planning, or wire edit commands listed below.

- Selected bump placement commands:
  - create_bump
  - deleteBumps
- Selected floorplanning commands:
  - alignObject
  - flipOrRotateObject
  - setObjFPlanBox
  - setObjFPlanBoxList
  - setObjFPlanPolygon
  - snapFPlan
  - snapFPlanIO
  - spaceObject
- Selected power planning commands:
  - addRing
  - addStripe
  - editPowerVia
  - sroute
- All wire editor commands:
  - editAddFillet
  - editAddPoly
  - editAddRoute
  - editAddTrimMetal

- editAddVia
- editChangeLayer
- editChangeNet
- editChangeRule
- editChangeStatus
- editChangeVia
- editCommitPoly
- editCommitRoute
- editCutWire
- editDelete
- editDeleteFillet
- editDeselect
- editDuplicate
- editFixWideWires
- editMerge
- editMove
- editRotate
- editSelect
- editSplit
- editResize
- editTrim
- prepareForEcoRoute

You can use the redo command to redo an edit that was reversed with undo.

Parameters

`-help`	Prints a brief description of the `undo` command. For a detailed description of the command, use the `man` command: `man undo`

Related Information

- `redo`
- Edit Menu chapter in the *Menu Reference*
  - *Undo*
  - *Redo*

unregister_gui_edit_callback

```
unregister_gui_edit_callback
[-help]
-command string
-edit_type {selection pre-move post-move}
```

Removes the callback function from the specified move action. In GUI, the move action involves the following three steps:

1. Click an object.
2. Move the object to the new location.
3. Click to place the object at the new location and complete the move.

The callback function is implemented based on the move action specified with the `-edit_type` parameter.

Parameters

`-help`	Prints the usage of the command. For a detailed description of the command, use the `man` command: `man unregister_gui_edit_callback`
`-command string`	Specifies the name of the callback function.
`-edit_type {selection pre-move post-move}`	Specifies the GUI edit function: • `selection` - Implements the callback function when an object is selected (after Step 1). • `pre-move` - Implements the callback function just before the object is placed at the new location (after Step 2, just before you change the coordinates in Step 3). • `post-move` - Implements the callback function after an object is moved (after Step 3, when the tool updates the DB records).

Example

Consider the following proc definition:

```
proc move_event_callback {

     set objList [dbGet selected]

     foreach obj $objList {

           set type [dbGet $obj.objType]

           if {$type == "sdp"} {

                custom_snap_sdp $obj

           } elseif {$type == "inst"} {

                set cellName [dbGet $obj.cell.name]

                if {[regexp grf $cellName]} {

                     custom_snap_grf $obj

                }

           }

}

}
```

The following command triggers the `move_event_callback` function on the selected object just before the move is completed:

```
register_gui_edit_callback -edit_type pre_move -command move_event_callback
```

The following command removes the callback to the `move_event_callback` function:

```
unregister_gui_edit_callback -edit_type pre_move -command move_event_callback
```

Related Information

- `register_gui_edit_callback`
- `report_gui_edit_callback`

viewLast

```
viewLast [-help]
```

Displays the last view window or the previous view. This command provides the same function as the Zoom Previous icon (bindkey *w*).

Parameters

`-help`	Prints a brief description of the `viewLast` command. For a detailed description of the command, use the `man` command: `man viewLast`.

Related Information

- `viewNext`
- `zoomTo`
- `zoomIn`
- `zoomOut`
- `zoomSelected`
- The Main Window chapter in the Menu Reference

viewNext

```
viewNext [-help]
```

Displays the next view window. This command provides the same function as the *Next* toolbar widget. You can use the `viewNext` command or the *Next* toolbar widget to switch from the current display to the next location in the *Go To Saved Area* list or the next zoom level in the zoom sequence saved in the design memory. The equivalent bindkey is `Y`. When you press the `Y` bindkey or execute the `viewNext` command repeatedly, the tool cycles through all saved views (saved areas and zoom levels).

Parameters

`-help`	Prints a brief description of the `viewNext` command. For a detailed description of the command, use the `man` command: `man viewNext`.

Related Information

- `viewLast`
- `zoomTo`
- `zoomIn`
- `zoomOut`
- `zoomSelected`
- The Main Window chapter in the Menu Reference

viewSnapshot

```
viewSnapshot
[-help]
-dir string
[-name string]
[-view string]
```

Opens a window `SnapShot Result` for viewing saved snapshots. Snapshots are selected based on the options: `-dir` and `-name`. The window displays design views controlled by the `-view` option and also shows QoR parameters (WNS,TNS, Placement Overlap, and congestion) saved at the time of creating the snapshot.

Parameters

`-dir` *`string`*	Specifies the directory of the saved snapshot, when opted alone it will show all snapshots saved in the directory.
`-help`	Outputs a brief description that includes type and default information for each `viewSnapshot` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man viewSnapshot`.
`-name` *`string`*	Specifies the name of snapshot to be viewed in the `SnapShot Result` window.
`-view` *`string`*	Specifies the view of the design you want to see in `SnapShot Result` window. You can see multiple views by listing them under this option. *Default:* The fplan view is shown in the `SnapShot Result` window.

Note: This command will not work in the `-nowin` mode.

Examples

- The following command will show all the snapshots present in the directory `/work/user1`, along with all QoR parameters (WNS, TNS, Placement Overlap, and Congestion). By default only the fplan view will be displayed.

  ```
  viewSnapshot -dir {/work/user1}
  ```

- The following command will show snapshots with the name `cts` along with all QoR parameters (WNS, TNS, Placement Overlap, and Congestion). By default only the fplan view will be displayed.

  ```
  viewSnapshot -dir {/work/user1} -name cts
  ```

- The following command will show snapshots with the name `cts` along with all QoR parameters (WNS, TNS, Placement Overlap, and Congestion). Only design views `cts`will be shown as opted under the -view option.

  ```
  viewSnapshot -dir {/work/user1} -name cts -view cts
  ```

- The following command will show all the snapshots present in the directory `/work/user1`along with all QoR parameters (WNS, TNS, Placement Overlap, and Congestion). All the views will be shown side by side.

  ```
  viewSnapshot -dir {/work/user1} -view {fplan amoeba place}
  ```

Related Information

  - *Create Snapshot*
  - *View Snapshot*

windowDeselect

```
windowDeselect
[-help]
[ux1] [uy1] [ux2] [uy2]
```

Deselects all objects within the specified area.

Note: This command works only in GUI mode.

Parameters

`-help`	Prints a brief description that includes type and default information for each `windowDeselect` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man windowDeselect`
`[ux1] [uy1] [ux2] [uy2]`	Specifies the coordinates of the window area to be deselected.

Example

The following command deselects objects that are totally enclosed by the area with coordinates defined as (`x=10`, `y=200`) and (`x=100`, `y=50`):

```
windowDeselect 10 200 100 50
```

Related Commands

- `lineSelect`
- `windowSelect`
- `windowToggleSelect`

windowSelect

```
windowSelect
[-help]
area
```

Selects all objects within the specified area.

Note: This command works only in GUI mode.

Parameters

`-help`	Prints a brief description that includes type and default information for each `windowSelect` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man windowSelect`
`area`	Specifies the coordinates of the window area to be selected. You can specify *`area`* using any of the following formats: • *`x1 y1 x2 y2`* Example: `windowSelect 10 10 20 20` • "*`x1 y1 x2 y2`*" Example: `windowSelect "10 10 20 20"` • {*`x1 y1 x2 y2`*} Example: `windowSelect {10 10 20 20}` • `[list 10 10 20 20]` Example: `windowSelect [list 10 10 20 20]` • `[dbGet $inst.box]` Example: `windowSelect [dbGet $inst.box]` Where `inst` is a variable that has already been set.

Example

The following command selects objects that are totally enclosed by the area with coordinates defined as (`x=10`, `y=200`) and (`x=100`, `y=50`):

```
windowSelect 10 200 100 50
```

Related Information

- `lineSelect`
- `windowDeselect`
- `windowToggleSelect`

windowToggleSelect

```
windowToggleSelect
[-help]
x1 y1 x2 y2
```

Toggles between selecting or deselecting objects that are enclosed by the area defined by the coordinates. Use this command to select or deselect all objects within a specific area.

Note: This command works only in GUI mode.

Parameters

`-help`	Prints a brief description that includes type and default information for each `windowToggleSelect` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man windowToggleSelect`
x1 y1 x2 y2	Specifies the coordinates of the window area to enclose the objects to be selected or deselected.

Example

The first command selects the objects that are totally enclosed by the area with coordinates defined as (`x1=10`, `y1=200`) and (`x2=100`, `y2=50`):

The second command deselects the objects that are totally enclosed by the same area:

```
windowToggleSelect 10 200 100 50

windowToggleSelect 10 200 100 50
```

Related Information

- `windowDeselect`
- `windowSelect`

zoomBox

```
zoomBox
[-help]
area
```

Zooms in the viewable window to the area that encloses the specified coordinates.

Parameters

`-help`	Prints a brief description that includes type and default information for each `zoomBox` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man zoomBox`.
`area`	Specifies the coordinates for the box representing the area into which you want to zoom.

Example

The following command zooms in the viewable window to the area enclosed by the lower-left coordinates (`450 531`) and the upper-right coordinates (`550 631`)

```
zoomBox 450 531 550 631
```

    - *Zoom*

zoomIn

```
zoomIn [-help]
```

Zooms in the viewable window.

Parameters

`-help`	Prints a brief description of the `zoomIn` command. For a detailed description of the command, use the `man` command: `man zoomIn`.

Related Information

- `viewLast`
- `viewNext`
- `zoomBox`
- `zoomOut`
- `zoomSelected`
- `zoomTo`
- View Menu chapter in the *Menu Reference*
  - *Zoom*

zoomOut

```
zoomOut [-help]
```

Zooms out from the viewable window by two times.

Parameters

`-help`	Prints a brief description of the `zoomOut` command. For a detailed description of the command, use the `man` command: `man zoomOut`.

Related Information

- `viewLast`
- `viewNext`
- `zoomBox`
- `zoomIn`
- `zoomSelected`
- `zoomTo`
- View Menu chapter in the *Menu Reference*
  - *Zoom*

zoomSelected

```
zoomSelected
[-help]
[-margin value]
```

Zooms in the viewable window to the area that encloses the selected objects.

Parameters

`-help`	Prints a brief description of the `zoomSelected` command. For a detailed description of the command, use the `man` command: `man zoomSelected`.
`-margin value`	Specifies the zoom margin ratio as an integral value. The zoom margin is the minimum spacing between the bounding box of the selected object(s) and the layout view.  The minimum value is `0` and the maximum value is `99`. *Default*: 50

Related Information

- `viewLast`
- `viewNext`

- `zoomOut`
- `zoomTo`
- View Menu chapter in the *Menu Reference*
  - *Zoom*

zoomTo

```
zoomTo
[-help]
x y
[-radius value]
```

Zooms in the viewable window to the point defined by the coordinates with a default radius of 150 microns.

You can also use the Select bar to specify the zoom area center and radius directly from the GUI.

Parameters

`-help`	Prints a brief description that includes type and default information for each `zoomTo` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man zoomTo`.
`-radius value`	Zooms in the viewable window to a radius of the specified value in microns, with the center at the point specified by *x* and *y*. The radius *value* is of type float. *Default*: 150 microns
x y	Zooms in the viewable window to the point defined by the coordinates, `x` and `y`.

Examples

- When the following command is run, the display zooms in to the point with x=100 and y=200. The display area is centered at this point and has the default radius of 150 microns:

  ```
  zoomTo 100 200
  ```

- When the following command is run, the display zooms in to point with x=100 and y=200. The display area is centered at this point and has a radius of 50 microns:

  ```
  zoomTo 100 200 -radius 50
  ```

Hierarchical Design Commands

- saveModel

saveModel

```
saveModel
[-help]
-dir string
[-ilm]
[-sdf]
[-spef]
[-stream [-mapFile string][-outputMacros]]
```

Saves block level design information for top level implementation. You can use this command after block implementation. The `saveModel` command saves the following data by default:

- LEF
- DEF
- Innovus DB (*.enc.dat)

For timing library (.lib) generation you need to use the `do_extract_model` command.

Parameters

`-dir` *string*	Specifies the name of the directory where you want to write the files. You can specify an additional level of hierarchy to define the model design stage, for example:
	`results_conv_model/postRoute/...`
	`results_conv_model/signoff/...`
	Data_type: string, required

`-help`	Outputs a brief description that includes type and default information for each `saveModel` parameter. For a detailed description of the command and all of its parameters, use the man command: `man saveModel`.
`-ilm`	Generates ILM models. *Data_type*: bool, optional
`-mapFile` *string*	Specifies the file used for layer mapping. This file is required for successful stream out, and is read by the next tool used in the design flow. *Data_type*: string, optional
`-outputMacros`	Writes LEF abstract information such as LEF pin geometries and obstructions for macros. Writes one text label per port within a LEF macro pin plus one text label per shape for feedthrough pins. For more information, see `streamOut`. *Data_type*: bool, optional
`-sdf`	Generates the delay data for each view in MMMC mode or for setup and hold modes. *Data_type*: bool, optional
`-spef`	Generates parasitic data if a design is at least routed. It invokes extraction, if not already extracted. For extraction, it honors the default, detailed or CCE mode user settings. *Data_type*: bool, optional
`-stream`	Generates Stream data, if the design is routed. *Data_type*: bool, optional

Examples

- The following command creates a directory called cts_condor_dma that contains the LEF (.lef and antenna.lef) files under the library directory, delay and parasitic information, and the design data of dma block:

  ```
  saveModel -sdf -spef -dir cts_condor_dma
  ```

Related Information

ILM and FlexILM Commands

- commit_module_model
- createInterfaceLogic
- flattenIlm
- getIlmMode
- getIlmType
- import_ilm_data
- read_ilm_eco_db
- reportIlmStatus
- setIlmMode
- setIlmType
- specifyIlm
- unflattenIlm
- unspecifyIlm
- update_partition
- write_ilm_eco_db

commit_module_model

```
commit_module_model
[-help]
[-copy_mmmc_latencies]
[-merged_mmmc_map_file mapFiles]
[-merged_mmmc_sdc_files mergedSdcFiles]
[-mmmc_file fullChipSdc]
[-mmmc_module_model_tag modelTag]
[-propagate_clocks]
[-cpf_file filename | -1801 filename]
```

Commits module models.

Parameters

`-copy_mmmc_latencies`	Copies clock latencies of all analysis views at the top-level design and applies them after assembling the design:
	When this option is specified, the command will do following after assembling the design:
	`foreach view [all_analysis_views] {`
	`update_analysis_view -name $view -latency_file $latency_map($view)`
	`}`
	Where `latency_map` has clock latency files for all views.

`-cpf_file` *`filename`*	Specifies the name of the full chip CPF file to be used.
`-help`	Outputs a brief description that includes the type and default information for each `commit_module_model` parameter. For a detailed description of the command and all of its parameters, use the man command: `man commit_module_model`
`-merged_mmmc_map_file` *`mapFiles`*	Specifies merge hierarchical mmmc map files.
`-merged_mmmc_sdc_files` *`mergedSdcFiles`*	Specifies SDC files for different dies.
`-mmmc_file` *`fullChipSdc`*	Specifies the name of the full chip MMMC view file.
`-mmmc_module_model_tag` *`modelTag`*	Specifies MMMC module model tag.

`-propagate_clocks`	Changes clock ideal to propagated clock. When this option is specified, you can run the following commands:
	`set_interactive_constraint_modes [all_constraint_modes -active]`
	`set_propagated_clock [all_clocks]`

`-1801` *`filename`*	Specifies the name of the IEEE 1801 file to be used.

Related Information

- set_interactive_constraint_modes
- set_propagated_clock
- update_analysis_view

createInterfaceLogic

```
createInterfaceLogic
[-help]
[-allowIlmEco]
[-ignorePorts ListOfPorts]
[-keepAll][-keepSelected]
[-modelType {timing si all}]
[-noInterClockPath]
[-overwrite]
[-removePowerGround]
[-dir dirName | -cellview {lib | cell | view}]
[ [-optStage {preCTS postCTS}] ]
```

Creates the specified directory containing ILM files with the appropriate level of extraction for specific model type such as timing, si, or for all models. For MMMC, ILM models will be generated based on constraint modes.

The `createInterfaceLogic` command creates a reduced set of instances representing only the interface paths, that is, paths from the I/O ports of the design to the first level of sequential instances (latches are considered sequential elements).

The command automatically modifies the module name with the following rule:

```
topModuleName+timestamp+$+moduleName
```

Parameters

`-help`	Outputs a brief description that includes type and default information for each `createInterfaceLogic` parameter. For a detailed description of the command and all of its parameters, use the man command: `man createInterfaceLogic`
`-allowIlmEco`	Allows ECO changes within the ILM block.
`-cellview {lib | cell | view}`	
	Specifies OA cell view information for generated ILMs. The `-cellview` option cannot be used in non-OA flow. For non-OA flow, you use the `-dir` option instead.

`-dir` *dirName*	Specifies the output directory name where ILMs file will be saved. If the design is not an OA design, this option must be specified.
`-keepAll`	Preserves the complete logic of block and hence does not do any logic pruning based on constraints or path groups. **Note:** Since the complete logic is preserved, so all the ILM views, that is, timing, CTS, and SI share the same model data.
`-ignorePorts` *ListOfPorts*	
	Specifies list of ports where these ports and the associated interface path(s) which are starting or ending at these ports will not be included in the ILM model.
`-keepSelected`	Preserves all selected instances and nets (in addition to those normally kept) when you create ILMs. Selected instances are those instances that drive the selected nets. You can select instances or nets using the `selectInst` or `selectNet` commands, then use `createInterfaceLogic -keepSelected`. By default, no additional instances and nets are preserved.
`-modelType {timing | si | all}`	
	Specifies the type of ILM model to be created. Default: `all` • `all`: Ensures that all models are written. • `timing`: Ensures that only the timing model is written for non-SI based timing, optimization, or clock tree commands. • `si`: Ensures that only the SI model is written that can be used for the SI based timing and optimization commands.
`-noInterClockPath`	Minimizes the clock latency at the upper-level CTS when the non-boundary flop in ILM has the maximum clock latency.
`-optStage {preCTS | postCTS}`	
	Specifies the optimization stage, preCTS or postCTS. This option should be specified both for ILM and flexILM creation.

`-overwrite`	Overwrites existing files.
`-removePowerGround`	Removes PG ports, PG nets, PG pin connections, and replaces PG net connections on signal pins with 1'b1 or 1'b0 .

Examples

- The following command generates both timing model and SI model in directory BlockA:
  ```
  createInterfaceLogic -dir BlockA
  ```
- The following command only generates timing model and saves it in directory BlockA:
  ```
  createInterfaceLogic -dir BlockA -modelType timing
  ```
- The following command completely replaces the library, cell and view in an OA flow.
  ```
  createInterfaceLogic -cellview {lib | cell | view} -overwrite
  ```

Note: In the current ILM flow, SDC constraints originally specified against the complete flat netlist for the design get filtered when being applied against the ILM view of the design.

Note: The `setIlmMode` command settings also affect the instances that `createInterfaceLogic` command will preserve to model the block.

Sample Summary Report

The following is a sample summary report generated at the end of the `createInterfaceLogic` command:

createInterfaceLogicSummary

Model	Reduced Instances	Reduced Registers
ilm_data	7153/7621 (93%)	174/285 (61%)
si_ilm_data	6793/7621 (89%)	160/285 (56%)

In this report, the reduction ratio in the `ilm_data` model is 93 percent which means that 7153 out the total 7621 instances for this block have been eliminated. Only 468 instances are written to the Verilog netlist for the `ilm_data` model out of which 111 instances are registers.

This summary report applies to a block using MMMC. Therefore, views with worst reduction ratio are displayed for each model.

Related Information

- `setIlmMode`
- *Creating ILMs for Shared Modules* topic in the Top-level Timing Closure Methodologies chapter of the *Innovus User Guide*.

flattenIlm

```
flattenIlm
[-help]
```

Flattens the interface logic models (ILMs) at the top level so that the entire design can be analyzed at the top. When you use this command, the software switches from blackbox view to ILM view.

If you do not run `flattenIlm`, the ILM netlist will not be visible to the Innovus software. You can switch between the ILM view and the blackbox view using the `flattenIlm` and `unflattenIlm` commands.

All super commands such as `timeDesign`, `place_design`, and `optDesign` flatten the ILMs internally and hence no explicit `flattenILM` is required. However, you should use this command for other timing related commands. For example, for the `report_timing` command, you need to run `flattenILM` before reporting timing. It would not work in the unflattened mode.

Example:

```
flattenIlm

report_timing
```

Parameters

`-help`	Outputs a brief description that includes the usage of the `flattenIlm` command.

Related Information

- `optDesign`
- `place_design`,
- `report_timing`
- `timeDesign`

getIlmMode

```
getIlmMode
[-filterInternalPath]
[-ilm]
[-ilm ilmName]
[-keepAsync {true|false}]
[-keepFlatten {true|false}]
[-keepHighFanoutPorts {true|false}]
[-keepInstInSdc {true|false}]
[-keepLoopBack {true|false}]
[-map {view|corner}]
[-maxNumInsts]
[-maxNumRegisters]
[-resetMap {view|corner}]
[-slackDriven]
[-top topViewName]
[-quiet]
```

Displays information about the specified `setIlmMode` parameter in the Innovus log file and in the Innovus console. Displays the following information.

- Parameter name
- Current value
- Type (Boolean, string, and so on)
- Whether the current value was set by user

If you do not specify a parameter, the software displays information for all of the `setIlmMode` parameters.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `getIlmMode` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man getIlmMode`
`parameter_names`	
	Displays information for the specified parameters. You can specify one or more parameters.
`-quiet`	
	Displays the current settings for the specified parameters in Tcl list format only. If you specify `-quiet` without any parameters, the software displays the current settings of all `setILMMode` parameters in Tcl format.

Examples

- The following example displays the current setting for the `-keepAsync` parameter:

  ```
  getIlmMode -keepAsync
  ```

  The software displays the following information:

  ```
  -keepAsync false # bool, default=false

  false
  ```

- The following command displays the current settings for all `setIlmMode` parameters:

  ```
  getIlmMode
  ```

  The software displays the following information:

  ```
  -keepAsync false # bool, default=false
  ```

```
-keepHighFanoutPorts true # bool, default=true

-keepLoopBack false # bool, default=false

{keepAsync false} {keepHighFanoutPorts true} {keepLoopBack false}
```

- The following command displays the current setting for the `-keepHighFanoutPorts` parameter in Tcl list format only:
  ```
  getIlmMode -keepHighFanoutPorts -quiet
  ```
  The software displays the following information:
  ```
  true
  ```
- The following command reports which view of ILM, `blkA`, has been mapped to the top analysis view of `maxDelay`:
  ```
  getIlmMode -map view -top maxDelay -ilmCell blkA
  ```
- The following command reports all the corner mappings of ILM, `blkA`, that have been mapped to the top analysis corners:
  ```
  getIlmMode -map corner ilmCell blkA
  ```
- The following command reports all the view mappings for all ILMs:
  ```
  getIlmMode -map view
  ```
- The following command displays the current settings for all `setIlmMode` parameters in Tcl list format only:
  ```
  getIlmMode -quiet
  ```
  The software displays the following information:
  ```
  {keepAsync false} {keepHighFanoutPorts true} {keepLoopBack false}
  ```

Related Information

- `setIlmMode`

getIlmType

```
getIlmType
[-help]
[-model]
```

Displays information about the specified `setIlmType` in the Innovus log file and the Innovus console. Displays the following information:

- Parameter name
- Current value
- Type (boolean, string, and so on)
- The current value set by the user

If you do not specify a parameter, the Innovus software displays information for all of the `setIlmType` parameters.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `getIlmType` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man getIlmType`
`-model`	Outputs the model.

Examples

- The following example displays the current setting for the `-model` parameter:

  ```
  getIlmType -model
  ```

  The software displays the following information:

  ```
  timing
  ```

Related Information

- `setIlmType`

import_ilm_data

```
import_ilm_data
[-help]
[-cell block_name]
[-incr]
-model_type {timing | cts | si}
[-overwrite]
[-xtwf xtwf_file.spef]
{-dir directory_name | -cell_view lib cell view}
[-verilog cell_name.v [-cell_prefix cell_prefix -uniquify_netlist]]
[-sdc file_name -timing_view view_name]
[-spef spef_file.spef -rc_corner RC_corner_name]
[-optStage opt_stage]
```

Creates an ILM directory from existing data. It can only create non-merged models. This command is useful in situations where an ILM is to be created through external inputs or using data from third party models into a format that could be recognized by Innovus.

If the data files already exist in the specified directory, the tool stops and generates an error message. You can overwrite existing files by specifying `-overwrite`. You can add files to the directory by specifying `-incr`.

The command also creates a tcl script (cell_name_ILM.tcl) that you can source in your command file. The script contains the following command:

```
specifyIlm -cell cell_name -dir dir_name
```

Parameters

`-cell block_name`	Specifies the name of the block.
`-cell_prefix cell_prefix`	Specifies the cell prefix.
`-cell_view lib cell view`	Specifies the library name, cell name, and view name in the OpenAccess database format.
`-dir dir_name`	Stores the ILM data in the specified directory: the absolute directory path or the path relative to the current directory.

`-incr`	Lets you add files in addition to the existing files to the directory.
`-model_type {timing | cts | si}`	Specifies the type of ILM model, i.e timing, cts or si,.
`-help`	Outputs a brief description that includes the type and default information for each `import_ilm_data` parameter. For a detailed description of the command and all of its parameters, use the man command: man `import_ilm_data`.
`-optStage`	Specifies the optimization stage, preCTS or postCTS.
`-overwrite`	Overwrites existing files in the directory.
`-rc_corner` *RC_corner_name*	Specifies the RC corner name for MMMC analysis. It identifies the specified corner to be used with -spef.
`-sdc` *file_name*	Specifies an existing .sdc file that you want to include in the directory. It identifies the sdc file to be used with the specified view.
`-spef` *spef_name*`.spef`	Specifies an existing .spef file that you want to include in the directory. It identifies the spef file to be used with the specified corner.
`-timing_view` *view_name*	Specifies the view name for the ILM module. It identifies the specified view to be used with `-sdc`.
`-uniquify_netlist`	Uniquifies the input Verilog netlist. This ensures that there are no errors when ILMs are being loaded. Using this parameter, each sub-module for an ILM has a unique name, which is composed of the time stamp and its original name. For example, in top_sm WedJun31138212009$data_path, top_sm specifies the top-level design, WedJun31138212009 specifies the time stamp, and $data_path specifies the original module name. *Default*: `Off`
`-verilog` *netlist_name*`.v`	Specifies the verilog file you want to include in the ILM data directory.
`-xtwf` *xtwf_file.spef*	Specifies the .xtwf file that you want to include in the directory.

Examples

- The following commands create two module directories:

  ```
  import_ilm_data -cell blk1 -dir A -model_type timing -verilog V1.v -spef 1.spef -
  rc_corner corner1 -sdc sdcfile1 -timing_view view1

  import_ilm_data -cell blk2 -dir A -model_type si -verilog V2.v -spef 2.spef -
  rc_corner corner2 -sdc sdcfile2 -timing_view view2
  ```

- The command creates two tcl files in the current directory. The `blk1_ILM.tcl` file contains the following command:

  ```
  specifyIlm -dir A -cell blk1
  ```

  The `blk2_ILM.tcl` file contains the following command:

  ```
  specifyIlm -dir A -cell blk2
  ```

Related Information

- `specifyIlm`

read_ilm_eco_db

```
read_ilm_eco_db
[-help]
{-dir directoryName | -module_model_tag tagName}
```

Reads an ECO file after restoring a block-level design for non-iHDB flow.

- For iHDB flow, you should use `restore_module_model -add_ons {eco}` command to read the ECO file. Internally, `restore_module_model -add_ons {eco}` will source `<cellName>_eco.tcl` script that internally calls the `read_ilm_eco_db -module_module_tag` command.
- For non-iHDB flow, if you use `write_ilm_eco_db -module_model_tag`, you should use `read_ilm_eco_db -module_model_tag` to read an ECO file at block-level design.

Parameters

`-help`	Outputs a brief description of the `read_ilm_eco_db` command. For a detailed description of the command, use the man command: `man read_ilm_eco_db`
`-dir` *`directoryName`*	Specifies the directory name to write the ILM eco database. At the block-level design, if you use this command to read in the ECO changes, the command will automatically find out about the design name and only load/read the ECO file for this specific design.
`-module_model_tag` *`tagName`*	Specifies the tag name to use for iHDB. Use this option if `write_ilm_eco_db -module_model_tag` is used to save ECO file(s).

Related Topics

- restore_module_model
- write_ilm_eco_db

reportIlmStatus

```
reportIlmStatus
[-help]
```

Reports ILM status information including ILM block names, ILM data locations, and if the design is in the flattened or unflattened state.

You can use this command at any time in the flow, but it only reports ILM information if you have already specified ILMs in the design.

Parameters

`-help`	Outputs a brief description of the `reportIlmStatus` command. For a detailed description of the command, use the man command: `man reportIlmStatus`

Examples

The following command generates the ILM status report for `dtmf_recvr_core`:

```
reportIlmStatus

================================================================================
Current design: dtmf_recvr_core
Current view is ILM (after flattenIlm)
Current ILM data is for si mode.
================================================================================

Cell          Model-Type        Use-Type          Stage          Instance Name
--------------------------------------------------------------------------------
results_conv     All              ILM               -          RESULTS_CONV_INST
tdsp_core        All              ILM               -          TDSP_CORE_INST

ILM/flexILM Data Location :
--------------------------------------------------------------------------------
results_conv : .../libs/ilm/results_conv.ilm
tdsp_core : .../libs/ilm/tdsp_core.ilm
================================================================================
```

setIlmMode

```
setIlmMode
[-help]
[-reset]
[-filterInternalPath {true|false}]
[-keepAsync {true|false}]
[-keepHighFanoutPorts {true|false}]
[-keepInstInSdc {true|false}]
[-ilm ilmName]
[-ilmCell ilmCellName]
[-keepFlatten {true|false}]
[-keepLoopBack {true|false}]
[-map {view|corner}]
[-maxNumInsts maxInstances]
[-maxNumRegisters maxRegisters]
[-resetMap {view|corner}]
[-slackDriven {true|false}]
[-top topViewName]
```

Controls certain behaviors of ILM commands.

Use the `getIlmMode` command to display the current settings for the `setIlmMode` command.

You can set certain options through `setIlmMode` which can control how ILMs are created or the way top level is mapped to ILMs in case of mismatch between view/corner naming between block and top.

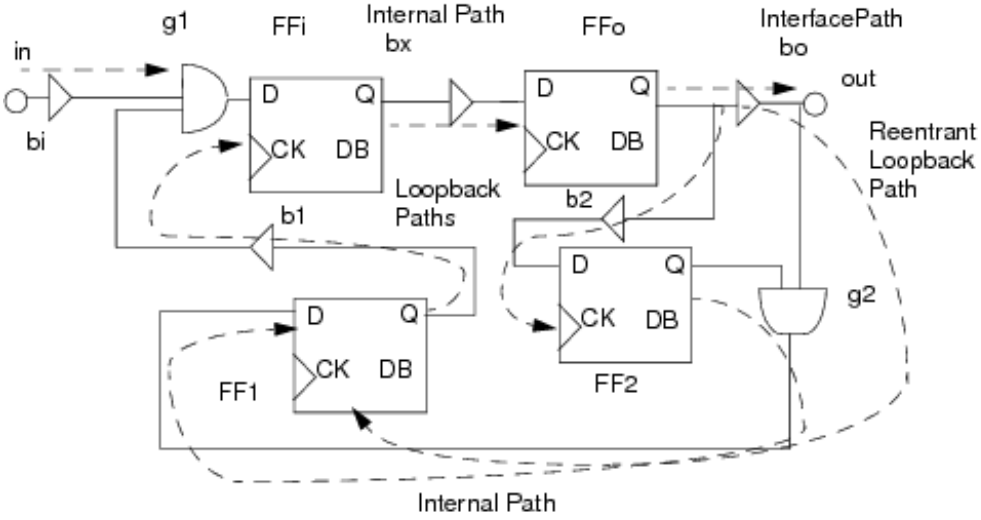
Parameters

`-help`	Outputs a brief description that includes type and default information for each `setIlmMode` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man setIlmMode`.
`-filterInternalPath {true|false}`	Filters the internal path kept by ILM. When set to `true`, group paths are created for internal paths with slack adjustment of 9999. Therefore, all internal paths are filtered out from the timing report. *Default*: `false`

`-keepAsync {true | false}`	Keeps paths from asynchronous input ports when ILMs are created by `createInterfaceLogic`. For example, paths from an input port to the reset pin of interface sequential instances, but not to the internal sequential instances. *Default:* `false`
`-keepHighFanoutPorts {true | false}`	Keeps high-fanin outputs and high-fanout inputs when ILMs are created by `createInterfaceLogic`. *Default:* `true`
`-keepInstInSdc {true|false}`	Keeps instances which have constraints on it. *Default:* `false`
`-ilm ilmViewName |ilmCornerName`	Specifies the view or corner name of an ILM that is to be mapped to the top level.
`-ilmCell` *`ilmCellName`*	Specifies the cell name of an ILM that has view or corner mapping to the top level.
`-keepFlatten {true|false}`	Makes flow work under the flattenIlm mode. *Default:* `true`
`-keepLoopBack {true | false}`	Keeps loop back paths when ILMs are created by `createInterfaceLogic`. When set to `true`, then any path touching a net used for the ILM model is also included. This is done for better model accuracy, so that the actual capacitance on an output port could affect the delay on a net which feeds an internal path that is normally not included in the ILM model. This also degrades the reduction ratio (`#ILM_insts/#all_inst`) for the block. *Default:* `false`
`-map {view | corner}`	Maps a view or corner specified in an ILM to a view or corner of the top-design analysis. *Default*: `view`

`-maxNumInsts` *maxInstances*	Specifies the maximum number of instances. *Default*:1000
`-maxNumRegisters` *maxRegisters*	Specifies the maximum number of registers per port to be considered as high fanout ports. This setting will be honored by `-keepHighFanoutPorts`. *Default*: 40
`-reset`	Resets all or specified options to default value. Any values that do not already match the default value and are reset will be reported.
`-resetMap {view | corner}`	Resets view or corner mapping between an ILM and the top level. *Default*: `view`
`-slackDriven {true|false}`	Specifies slack driven ILM generation. *Default:* `false`
`-top` *topViewName* | *topCornerName*	Specifies the view or corner name of top design analysis while creating the mapping between the ILM and the top level. *Default*: ""

Loop-Back Paths



Examples

- The following command does not keep high fanout ports when ILMs are created by `createInterfaceLogic`:

  ```
  setIlmMode -keepHighFanoutPorts false
  ```

- The following command resets the `-keepHighFanoutPorts` parameter to its original value:

  ```
  setIlmMode -reset -keepHighFanoutPorts
  ```

- The following command undoes all the view mapping for ILM `modA`:

  ```
  setIlmMode -resetMap view -ilmCell modA
  ```

- The following command maps the view of `maxCnr_setup` of the ILM `blkA` to the top design analysis view of `rcMAX_setup`:

  ```
  setIlmMode -map view -top rcMAX_setup -ilmCell blkA -ilm maxCnr_setup
  ```

- The following command undoes all the corner mapping for ILM `blkA`:

  ```
  setIlmMode -resetMap corner -ilmCell blkA
  ```

Related Information

- `createInterfaceLogic`.
- `getIlmMode`
- Top-level Timing Closure Methodologies chapter of *Innovus User Guide*.

setIlmType

```
setIlmType
[-help]
[-model {timing | si}]
```

Controls the behavior of commands in the presence of ILMs.

ILM models can be an SI model or a non-SI model. In the flow, sometimes an explicit `flattenIlm` needs to be performed to perform the underlying operation. Based on the nature of operation, an appropriate model could be invoked/switched with the above command.

Use the `getIlmType` command to display the current settings for the `setIlmType` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `setIlmType` parameter. For a detailed description of the command and all of its parameters, use the man command: `man setIlmType`.
`-model {timing | si}`	Specifies the ILM model that is to be used by the `flattenIlm` command. All the timing-related commands require data to be in the flattened state (physical command require unflattened state). Design commands such as `optDesign` and `timeDesign` automatically set this parameter before flattening ILMs. However, the CTE commands and some clock commands, which can be run in the flattened mode require manual settings. • Use the `si` model for flattening the SI ILM model. • Use the `timing` model for flattening the non-SI related timing commands. **Note:** In case of non-merged models, use the `cts` model before running `flattenIlm` followed by the command which directly deals with the clocks. *Default*: `timing`

Examples

- The following command is used to report clock tree in the presence of ILMs:

  ```
  flattenIlm
  reportClockTree
  unflattenIlm
  ```

  The `unflattenIlm` command resets `-model` to its default value `timing` since the next command is not a clock command.

- The following command can be used to get timing reports containing the SI push-out delays on nets using the `-setIlmType -model` command:

  ```
  setIlmType -model si

  # Flattens to SI model

  flattenIlm

  # Turns on SI aware delay calculation

  setDelayCalMode -SIAware true

  # Adds incremental delay column (for SI push-out delays)
  #  in timing output:

  set_global_report_timing_format {instance arc cell fanout load slew delay
  incr_delay arrival}

  # Minimizes the width of the report such that it easily
  # fits into the screen without wrapping

  set_table_style -name report_timing -no_frame -indent 0

  report_timing
  ```

Note: You can also invoke the Global Timing Debugger (*Timing - Debug Timing - Generate*)

Related Information

- `flattenIlm`
- `getIlmType`
- `optDesign`
- `timeDesign`
- Top-level Timing Closure Methodologies chapter of *Innovus User Guide*.

specifyIlm

```
specifyIlm
[-help]
{[-cell cellName [-dir dirName]] | -cellview lib cell view}
```

Specifies ILM data directory for the specified block. You can run `specifyIlm` multiple times in the same session. Each time you specify `specifyIlm`, the software overwrites the previous setting for the block. If master/clones exist in the design, the cell name will have the name of the master partition.

Note: You can use this command only if the ILMs are unflattened (`unflattenIlm`) or the design is in black box view. You cannot change ILM settings in flattened or ILM view.

The syntax is order-dependent. You must specify `-cell` before you specify `-dir`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `specifyIlm` parameter. For a detailed description of the command and all of its parameters, use the man command: `man specifyIlm`
`-cell` *cellName*	Specifies the block name.
`-cellview` *lib cell view*	Specifies the library name, cell name, and view name in the OpenAccess database format.
`-dir` *dirName*	Specifies the directory for the files you want to read. **Note:** This parameter is optional. ⚠ For OA flow, the `-dir` option is not required and `specifyIlm` is used as follows: `specifyIlm -cell pll_fbdiv` The flow automatically finds the OA path when the `-dir` for `specifyIlm` is not set.

Examples

- The following commands create ilms and specify ilms for an OA design:

```
#create ilms for each block
createInterfaceLogic -cellview {OA_PTN_LIB tdsp_core abstract}
createInterfaceLogic -cellview {OA_PTN_LIB results_conv abstract}
#specify ilms in top level
specifyIlm -cell tdsp_core
specifyIlm -cell results_conv
```

- The following commands specifies directory `dir_dsp_core` for block `tdsp_core`, and directory `dir_onemore` for block `onemore`:

```
specifyIlm -cell tdsp_core -dir dir_dsp_core
specifyIlm -cell onemore -dir dir_onemore
```

- The following commands show how to reset the ILM directory from `dir_tdsp_core` to `dir2_tdsp_core`:

```
specifyIlm -cell tdsp_core -dir dir_tdsp_core
specifyIlm -cell tdsp_core -dir dir2_tdsp_core
```

  These commands are equivalent to the following commands, which include `unspecifyIlm`:

```
specifyIlm -cell tdsp_core -dir dir_tdsp_core
unspecifyIlm -cell tdsp_core
specifyIlm -cell tdsp_core -dir dir2_tdsp_core
```

Related Information

- `createInterfaceLogic`
- `unflattenIlm`
- `unspecifyIlm`
- Top-level Timing Closure Methodologies chapter of *Innovus User Guide*.

unflattenIlm

```
unflattenIlm
[-help]
```

Reverts the ILM back to its original hard macro view.

You can use this command after the `flattenIlm` command.

Note: `unflattenIlm` will take no effect if the design is already in the unflattened mode.

Many physical commands would not work in the flattened mode. They would need to be unflattened before performing the operation.

For example:

```
flattenIlm

report_timing

unflattenIlm
```

Parameters

`-help`	Outputs a brief description that includes the usage of the `unflattenIlm` command.

Example

The following command flattens all partitions and their ILM designs to the top-level. After reporting timing, the design is reverted back to the unflattened state with the `unflattenIlm` command.

```
flattenIlm

report_timing

unflattenIlm
```

Related Information

- `flattenIlm`
- `report_timing`
- Top-level Timing Closure Methodologies chapter of *Innovus User Guide*.

unspecifyIlm

```
unspecifyIlm
[-help]
-cell cellName
```

Unspecifies the ILM cell.

This is used to unspecify a previously specified ILM. This would be useful in situations where ILMs are to be removed from the design, to put them in non-ILM or black box mode.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `unspecifyIlm` parameter. For a detailed description of the command and all of its parameters, use the man command: `man unspecifyIlm`
`-cell` *`cellName`*	The name of the block to unspecify.

Related Information

- `specifyIlm`
- Top-level Timing Closure Methodologies chapter of *Innovus User Guide*.

update_partition

```
update_partition
[-pinLocation]
[-postECOSuffix postECOSuffix]
{-flexIlmECO}
{-goldenBlockDir directory}
-flexIlmDir directory
[-ecoDir directory]
[-fullNetlistWithECODir directory -flexILMECODir directory]
```

Creates a new partitioned output that contains the optimised blocks and top. It also performs ECO on the original block. The ECO output is saved as new Innovus database in the partitioned block. The ECO would happen only on `flexILM` partitions and not the regular blocks.

Parameters

`-ecoDir` *directory*	Specifies the scratch directory for partitioning and running distributed ECO job after optimization.
`-flexIlmDir` *directory*	Specifies the new partitioned output directory containing optimized blocks/top and ECO results.
`-flexIlmECO`	Performs ECO on FlexILM modules. **Note:** This is default.
`-flexILMECODir` *directory*	Specifies the postOpt FlexILM data directory.
`-fullNetlistWithECODir` *directory*	Specifies the directory to store full netllist ECO result.
`-goldenBlockDir` *directory*	Specifies the golden database directory for individual blocks.
`-pinLocation`	Updates new partition pin locations into the golden block DB. This option does not allow new added logic ports.
`-postECOSuffix` *postECOSuffix*	Specifies the suffix name that will be part of generated postECO DB name.

Examples

The following command will perform ECO on the block of `tdsp_core`, `ram_128x16_test` and `ram_256x16_test`.The ECO output is saved as new Innovus database with the suffix "`_postECO`" at the "`../flexILM_postOpt`" directory (which is defined by the `-flexIlmDir` option) for each specified partition block.

```
update_partition -flexIlmECO \
-goldenBlockDir ../../PTN/tdsp_core/tdsp_core_data.enc.dat \
-goldenBlockDir ../../PTN/ram_128x16_test/ram_128x16_test_data.enc.dat \
-goldenBlockDir ../../PTN/ram_256x16_test/ram_256x16_test_data.enc.dat \
-flexIlmDir ../flexIlm_postOpt -postECOSuffix postECO
```

After `update_partition`, a new dir of `flexIlm_postOpt` will be generated. Under this directory, `ecoDataSummary.rpt` will be generated to show summary for post ECO data and an example for `assembleDesign` to use post ECO data.

```
# Post ECO Data Summary
##########################################################################
##
TOP data: ../flexIlm_postOpt/dtmf_recvr_core
ram_256x16_test data:
../flexIlm_postOpt/ram_256x16_test/ram_256x16_test_postECO.enc.dat
ram_128x16_test data:
../flexIlm_postOpt/ram_128x16_test/ram_128x16_test_postECO.enc.dat
tdsp_core data: ../flexIlm_postOpt/tdsp_core/tdsp_core_postECO.enc.dat
##########################################################################
##
#To assemble postECO full netlist data, please run
assembleDesign -fe -topDir ../flexIlm_postOpt/dtmf_recvr_core\
-blockDir ../flexIlm_postOpt/ram_256x16_test/ram_256x16_test_postECO.enc.dat\
-blockDir ../flexIlm_postOpt/ram_128x16_test/ram_128x16_test_postECO.enc.dat\
-blockDir ../flexIlm_postOpt/tdsp_core/tdsp_core_postECO.enc.dat\
-mmmcFile <full chip viewDefinition file>
##########################################################################
##
```

Note: if there is no `-postECOSuffix` specified, a suffix of "`eco_<system time>`" will be added to the ECO database.

write_ilm_eco_db

```
write_ilm_eco_db
[-help]
-cell tcl_obj]
{-dir directoryName  | -module_model_tag tagName}
```

Saves netlist and placement information changes::

- Generates a binary ECO file that can be read/loaded back to a block-level design
- Generates the ECO TCL script with `read_ilm_eco_db -module_model_tag` for iHDB
- Output as corresponding ECO report file for viewing purpose

Parameters

`-help`	Outputs a brief description of the `write_ilm_eco_db` command. For a detailed description of the command, use the man command: `man write_ilm_eco_db`
`-cell` *`tcl_obj`*	Specifies a cell name for ECO information to be written out. If the specified cell name does not have any ECO change, both ECO and report files will be empty. If this option is not specified, the command will write ECO information for all ILMs specified in the design EVEN an ILM cell is not allowed for ECO. This to make sure accumulated ECO information will be preserved/saved as an ILM can be opened and then closed later during the flow. If there is no ECO change done to a particular cell, its ECO and report files will be empty.
`-dir` *`directoryName`*	Specifies a directory name where ECO files will be saved. All the ECO and/or report files should be saved under the convention *`dirName/cellName/cellName.eco`* and *`dirName/cellName/cellName.rpt`*, respectively.
`-module_model_tag` *`tagName`*	Specifies the model tag name where ECO file, ECO TCL, and its report will be saved. This option should be used for Stylus hierarchical DB.

check_design

```
check_design
[-help]
[-out_file fileName]
{[-type {library netlist power_intent timing hierarchical pin_assign budget assign_statements place opt cts route signoff all}] [-no_check
]}
```

Checks that all prerequisites to run all or part of the hierarchical or block implementation flow are met.

The `check_design` command checks the preconditions for major flow steps before they are run. If there are errors identified by `check_design`, the current script will stop.check. Note that output to console and log file is controlled by message display limit. A complete list of errors is dumped to `-out_file`.

Some examples of problems that will cause design checks to fail include:

- Cells used in the design that cannot be legally placed
- Tracks misaligned with some or all cell pins
- In advanced processes, power nets that cannot be colored in the expected pattern once cells are placed
- Cell rows that are unblocked for placement but where pin layers are obstructed
- Cell rows that are unusable due to orientation and power rail misalignment
- Cells instantiated in the netlist that have no timing model defined
- Tracks blocked by power grid spacing constraints
- Instances not covered by a true timing path in any view
- ILM model with no clock tree defined
- No hold fixing cells are specified and delay cells are not usable
- No clock inverters, buffers, clock gates or logic cells are specified and the library cells are not usable for clock trees
- CTS cannot balance all skew groups without increasing insertion delay
- Preserved nets and cells in the clock tree that will violate other constraints because they cannot be resized or buffered.

Parameters

`-help`	Prints a brief description that includes a list of parameters, their usage, and their defaults. For a detailed description of the command and all of its parameters, use the `man` command: `man check_design`. No other args allowed with `-help`

`-type`	Specifies the category of the flow to be checked.
	The intent is to run `check_design` before each of the operation in the list. Each of the categories run several checks related to that operation.
	• `library`: Checks for the integrity of the library and for correct binding of all design instances to library cells or RTL modules. Individual checks are as follows:
	  ◦ For physical_only library, check_design will flag libcells that have only LEF but no .lib representation.
	  ◦ For logical_only library, check_design will flag libcells that have only .lib but no LEF representation.
	• `netlist`: Checks the netlist integrity at any point in the flow.
	  ◦ For undriven netlist, check_design will check the list of input/inout hpins/pins with no driver on the net connected to it (driver can be input port or output hpin/pin).
	  ◦ For multiple_driver netlist, check_design will check the list of input/inout pins or output/inout ports with more than one driver on their net)
	  ◦ For unloaded netlist, check_design will check the input/inout ports or output hpins/pins with no load (input/inout pins) in their fanout or hinsts/insts that have nothing connected to any output pin)
	  ◦ For constant netlist, check_design will check the output ports or input pins/hpins that are driven by a logical constant 0/1.
	  ◦ For feedthrough netlist, check_design will check the hinsts, where every output pin is directly driven by an input pin, w/o any logic in between).
	  ◦ For empty_modules, check_design will reports empty modules in the design.
	• `library`: Checks the library integrity and corrects binding of all design instances to library cells or RTL modules.
	• `power_intent`: Checks related to MSV setup including power domain/fence checks.
	• `timing`: Performs checks related to timing setup integrity. This check is run prior to running any operation that requires timing information. **Note**: The `check_timing` command should still be used for more exhaustive timing checks.
	• `hierarchical`: When you use the `hierarchical`, `pin_assign`, or `budget` options with the `-type` parameter, the `check_design` command checks for hierarchical partitions in the design. It performs checks related to the hierarchical flow. This type checks if the partition has a fence and if the fence is inside the core boundary. If not, it displays an error message. This check is run before running hierarchical design operations.
	• `pin_assign`: Checks related to pin assignment for partitioning flows. This check is run before pin assignment.
	• `budget`: Checks related to time budgeting for partitioning flows. This check is run before timing budgeting.
	• `assign_statements`: Performs checks for the netlist for assign statements. This check is run before exporting a netlist for signoff.
	• `place`: Checks related to placement such as PG rail alignment, pin access issues, missing followpin in the rails of standard cells, misaligned well tap cell, and missing termination cell. This check is run before placement.
	• `opt`: Checks related to optimization such as checks for available cells. This check is run before optimization.
